Societies and in the entire State Society. These figures are sufficiently clear to obviate the necessity of extended comment. It will be noted that there are now 13,195 members of the State Society as compared with 12,812 in the previous reporting period, and that there are now 7,699 insured members as compared with 7,334 in the previous year.

Counsel Work

During the period of this report, your Counsel has prepared for publication in the Society's Journal articles in the nature of editorial comment. These editorials have included the following:

This Year's Chiropractic Bill.
Charitable Hospital—Liability for Negligence of Its Physicians and Nurses.
The Ownership of X-ray Plates.
Privilege Against Self-Incrimination — Waiver.
Retained Foreign Body—Court of Appeals Holds Surgeon Blameless.
Libel—Publication Established by Dictation to Stenographer.
Doctor's Statement Submitted by Insurance Beneficiary not Privileged.
Court's Power to Void Jury's Verdict on Ground of Bias.
Supreme Court Rules on Freedom of the Press.
Corporations—Legal Responsibility of Directors.
Corporate Directors, II.
Operation Without Consent.
Physician and Patient—Operation under Mistake as to Identity.
A Dangerous Precedent.
Physician's Fees—Patient's Ability to Pay.
Confidential Communications—An Interesting Case.
Automobile—Right of Police to Commandeer in Aid of Arrest.
Pharmacies—Power of State to Legislate on Question of Ownership.
Accidental Injury.
Federal and State Taxation of Gifts Made Prior to Death.
A Surgeon Recovers for Disabling Injuries. "Courts and Doctors."
Insanity—Liability of Physicians Making Examination.
Termination of the Relationship between Physician and Patient.
Your Counsel has also digested and there have been published in the Journal reports upon malpractice actions which it has been felt were of special interest to the profession. The case reports published during the previous year are as follows:

Claimed Negligence in Treating Tumor during Pregnancy.

Claimed Negligent Use of X-ray.

Alleged Negligent Operation during Pregnancy.

Claimed Negligent Treatment of Fracture of Humerus.

Needlebreak during Novocaine Injections.

Claimed Negligent Treatment of Fracture of Radius and Ulna.

Claimed Improper Treatment of Fracture of Radius.

Claimed Negligent Post-Operative Treatment of Club Feet.

Alleged Negligence in Tonsil and Adenoid Removal.

Alleged Negligence in Needle Breaking.

Alleged Wrong Diagnosis of Stomach Ailment.

Failure to Be Present at Delivery.

Claimed Negligent Treatment of Infected Finger.

Alleged Negligence in Breaking of Needle and Not Removing Same.

Claimed Negligent Treatment of Osteomyelitis.

Claimed Negligent Operation on Eye, Causing Blindness.

Claimed Negligent Treatment of Fracture of Femur.

Alleged Malpractice in Treating Stab Wound.

Alleged Negligent Treatment of Fracture of Arm.

Burn Claimed Caused by Negligent Physiotherapy.

Alleged Negligent Treatment of Injury to Child's Finger.

Alleged Negligent Tonsillectomy.

Alleged Negligent Diathermic Treatment.

Claimed Negligent Plastic Operation on Nose.

Failure to Be Present at Delivery.

Claimed Negligent Prescription of Ergoapio.

Claimed Negligent Treatment of Cut.

Failure to Detect Fracture and Dislocation.

Alleged Negligent Removal of Uvula during Tonsillectomy.

Claimed Improper Treatment of Fractured Arm.

Negligent Treatment of Empyema.

Alleged Negligent Treatment of Tonsils.

Hot Water Bottle Burn.

Claimed Negligent Abdominal Operation.

Suit for Professional Services—Malpractice Counterclaim.

Alleged Injuries by X-ray Machine.

Claimed Negligence in Administration of Electrotherapy.

Recurrent Hernia.

Alleged Negligence in Treating Fracture.

Burn from Diathermy Treatment.

Claimed Negligence in Treatment of Sinus Trouble.

Broken Needle.

Alleged Negligence in Use of Tourniquet.

In his contacts with the members of your Society your Counsel is pleased to find that these editorials and case reports are read with approval and interest by the members of your Society.

In addition to his other duties, your Counsel receives frequent requests for opinions on various subjects. It should be remembered that the Executive Committee of your Society has ruled that all requests for legal opinion coming from individual members of your Society or from component County Societies must, in the first instance, be referred to that body for action. If the Executive Committee deems the inquiry a proper one for opinion by Legal Counsel, it refers the same back to him for reply. Some of the matters upon which advice has been thus rendered are as follows:

Inquiry from a physician in good standing as to whether it would be legal for him to extract teeth, and the penalty for the illegal practice of dentistry.

Inquiry as to the period of time after treatment is rendered by a physician during which malpractice actions may be brought.

Communication requesting information in regard to hospital records:

- (a) To whom do hospital records belong?
- (b) What rules may a hospital make in regard to access to its records by a patient?
- (c) Is a rule limiting access to its records to the attending physician, proper?
- (d) What attitude should be taken towards attorneys who seek information?
- (e) What attitude should be taken towards physicians who seek information without going through the proper channels?

Inquiry as to whether a foreign insurance company not authorized to do business in this State is financially reliable.

Inquiry as to the criminal and civil liability of a physician who accedes to the request of his patient,

- (a) That her tubes be cut to prevent further pregnancies;
- (b) That her finger or other part of her body be amputated.

Inquiry as to the legal responsibility of a physician who relies on the report of a pathological laboratory.

Inquiry as to the time limit after treatment

is rendered, within which a patient may bring a malpractice action against a physician.

Inquiry as to whether a claim of alleged illegal commitment of an insane person is considered malpractice and, as such, covered by the group policy.

Communication requesting citation of cases discussed in editorial appearing in the NEW YORK STATE JOURNAL OF MEDICINE.

Inquiry regarding the advisability of a charitable hospital carrying insurance to cover:

- (a) The malpractice of its superintendent, physicians and internes;
- (b) The general liability of the hospital in relation to persons other than patients.

Inquiry regarding the legal liability of a physician,

- (a) Where the patient, contrary to the doctor's advice, refuses to permit him to administer tetanus antitoxin for a puncture wound;
- (b) Where serum sickness or other serious consequences develop following its administration.

Inquiry as to whether a physician is legally liable for divulging confidential information to an insurance company, where the privilege has not been waived; also as to when such privilege is deemed waived.

Communication requesting information as to when the Statute of Limitations runs in malpractice actions.

Inquiry regarding a charitable hospital having an X-ray laboratory in charge of a non-medical man:

- (a) What is the liability of the hospital for accidents in the X-ray room?
- (b) Would a general liability policy protect the hospital?
- (c) Would the malpractice policy of a physician protect the hospital or the technician where such physician was not directly in charge of the laboratory at the time of the particular accident?
- (d) Would the hospital policy protect the technician personally?

Communication requesting a form of consent to operation to be obtained by a hospital,

- (a) Where the patient is over age;
- (b) Where the patient is an infant;
- (c) Where the patient is a married woman.

Inquiry as to whether a physician should divulge to an insurance company information concerning treatment, where the patient has applied for disability payments under his insurance policy.

Communication inquiring, where a physician is requested to examine and comment on facial

blemish cases which are being treated by a non-medical person with a secret formula,

- (a) Is the physician becoming involved even with no mention of his name in the publicity?
- (b) Could such secret formula be patented and presented before medical societies in an ethical way, without jeopardizing its financial value?
- (c) Is such person violating the medical practice act?

Communication from a physician who had been called in to treat a woman suffering from the after-effects of a criminal abortion performed by a midwife, requesting advice on how to protect himself against any possible claim of unlawful practice.

Inquiry regarding hospital records:

- (a) Are such records privileged?
- (b) Is it necessary to obtain the patient's consent before they can be submitted in court?
- (c) If hospital records are subpoenaed and a damage suit ensues because of the information divulged, is the hospital or the attending physician liable?

Communication inquiring, where an infant has been injured by an automobile operated by an employee of a company which carries general liability insurance,

- (a) Is the father responsible for the payment of the doctor's bill?
- (b) What is the responsibility of the company whose employee stated to the doctor that it would pay the doctor's bill?
- (c) Is the insurance company justified in refusing to pay the doctor's bill where it has made a direct settlement with the father?

Inquiry regarding the disclosure to an insurance company of confidential information acquired by a physician, where the patient has not consented to the disclosure:

- (a) What information acquired by a physician in treating a patient is considered privileged?
- (b) What information may be disclosed to an insurance company?
- (c) What is the liability of the physician for disclosing such information?
- (d) What precautions should a physician take to avoid suit for disclosing confidential information?

Inquiry regarding the formation of a council composed of representatives from dental, medical and druggist societies:

- (a) Whether it would be necessary for such council to incorporate, if the individual

organizations represented were incorporated;

- (b) Whether the formation of such council is contrary to the constitution of the New York State Medical Society.

In addition to the foregoing, your Counsel has been requested to consider and render advice on the following:

Whether association by a physician with an advertising physiotherapist constitutes a violation of Section 31 of the Principles of Professional Conduct which prohibits advertising by physicians for the purpose of inviting attention to themselves.

Advice in regard to discontinuance by the State Society of an advertisement running in the *NEW YORK STATE JOURNAL OF MEDICINE*, and the sending of a proper notice to the advertiser in question.

Suggested revision in the present form of contracts for advertisements in the *NEW YORK STATE JOURNAL OF MEDICINE* and the *Medical Directory of New York, New Jersey and Connecticut*.

Your Counsel has rendered legal advice and has expressed his opinion to the following Committees appointed by the President of the Medical Society of the State of New York:

Committee to study the petition of the Franklin County Society that the State Medical Society and its Legislative Committee foster such legislation as is necessary to compel insurance companies to assume the payment of hospitals and physicians for attendance on victims of automobile accidents; to which Committee your Counsel gave a resume of previous proposed legislation on this subject, and its outcome.

Committee to consider the matter of hospital records and their availability for the attending staff; to which Committee your Counsel gave his legal opinion on the following:

- (a) Is a hospital within its rights in refusing to permit surgeons to make copies of hospital records in cases operated upon by the surgeon?
- (b) Has a hospital superintendent the right to make arbitrary rules in regard to access to hospital records, and are its physicians and surgeons bound by such rules?

Committee to study the report of the Committee on Medical Economics; to which Committee your Counsel gave his legal opinion on the following:

- (a) Before corporations engaged in the business of bill collecting and financing for sickness and operations can be accept-

able to the Society, they must comply with certain rules which have been formulated with a view to correcting abuses which now exist;

- (b) Recommendation by the Committee that physicians should be subject to mandatory call only from a judge of the court;
- (c) Recommendation by the Committee that physicians should be recognized as experts, and provision for standard compensation should be made by law;
- (d) Recommendation by the Committee that efforts be made to amend the law so as to make the physicians' fees a lien upon the recovered sum in negligence cases, which lien would include a fee for appearance in court.

Committee to study the report of the Governor's Special Health Commission on the administrative and legislative aspects of public health in the State of New York.

Your Counsel has also been in conference and consultation with and has acted as legal advisor to the Committee on the revision of the constitution and by-laws of the State Society. Your Counsel has also examined the proposed revised constitution and by-laws of several of the County Societies and has rendered advice and made suggestions in connection therewith. In addition, your Counsel has been in conference and consultation with the members of the Committee on Insurance with respect to the various matters that have been referred to them for action. Your Counsel also attended a

hearing on the proposed Coffey-Humbar Cancer Foundation Clinic.

Legislative Advice and Activities

Your Counsel's opinion has been requested and has been promptly given with respect to a large number of bills affecting the medical profession that came before the Legislature at its last session.

Every member of your Society owes a debt of gratitude to the Legislative Committee and to Dr. Joseph S. Lawrence, your Executive Officer, for their magnificent work during the last session of the Legislature.

Conclusion

The writer cannot conclude this report without at least a brief comment on the quantity and quality of the work done by your officers and Committees. The amount of work unselfishly done by them for the welfare of your members is indeed great. Personal contact with them demonstrates that you have chosen as your leaders men of character, integrity and industry. Stand by them and support them, and the hopes and aims of your Society will be achieved.

In his own field, the ambition and objective of your Counsel and his entire office staff is to render to your Society and to its individual members the highest possible type of legal service.

Respectfully submitted,

LORENZ J. BROSNAN, Counsel.

March 1, 1932.

TREATMENT OF COLLES' FRACTURE

A general practitioner was called to the home of an elderly lady who had just sustained a fall which had injured her wrist. Upon examination he determined the presence of a Colles' fracture. The doctor undertook to reduce the fracture as best he could, applying an aluminum splint. The patient's wrist was x-rayed and the picture revealed good apposition of the fragments with a slight displacement. The doctor realized that the alignment was not perfect and advised the patient to that effect. Examination of the patient's physical condition disclosed that her heart condition was very poor. He explained to her that a better reduction of the fracture would require an anaesthetic and that it was his judgment that her condition did not justify the administration of an anaesthetic. The patient remained under his care for about twelve weeks during which time he changed the dressings and adjusted the splint as be-

came necessary, and arranged that massage treatments be given to the patient.

When he discontinued his connection with the case the patient had a good functional result, although the wrist was somewhat restricted as to motion.

A suit was instituted against the doctor in which the plaintiff claimed that he had been guilty of malpractice in his treatment of her case. It was claimed that the patient had received a deformity which the doctor could have avoided had he followed the proper and approved practice. The case came on for trial before a judge and jury. At the close of the evidence introduced on behalf of the plaintiff a motion was made by the attorney for the defendant to dismiss the complaint on the ground that a cause of action had not been established. The judge granted the motion, for lack of proof that the doctor in any way departed from proper and approved practice.

THE ANNUAL MEETING

THE ANNUAL MEETING

The one hundred and twenty-sixth annual meeting of the Medical Society of the State of New York will be held on Monday, Tuesday and Wednesday, May 23-25, 1932, in the Hotel Statler, Buffalo, N. Y. There will be five major features as follows:

1. The House of Delegates will meet on the afternoon of Monday, May 23rd, and will prob-

ably hold sessions on that evening and on Tuesday morning.

2. Scientific sessions on Tuesday afternoon, and all day Wednesday.

3. A scientific exhibit, which will be open throughout the meeting.

4. Clinics in the hospitals of Albany on Monday.

5. Technical exhibits by dealers in medical wares.

SCIENTIFIC MEETINGS

The Committee on Scientific Work has arranged a program of unusual interest and practical value. General sessions will be held on the afternoons of Tuesday and Wednesday; and meetings of the eight scientific sections will be held on the mornings of those days.

Special sessions will also be held for the consideration of two additional topics:

1. Radiology on Tuesday morning, under the chairmanship of Dr. Joseph M. Steiner, New York.

2. Physical Therapy, with Dr. Richard Kovacs, New York, Chairman.

The following notice will appear on the program of each section:

"Essayist will please leave the original copies of their papers with the Secretary of the Sec-

tion when they finish reading them. All papers read before the Society by its members shall become the property of the Society. Discussers must type their remarks and hand them to the same officer if they wish to have them published in the Journal."

The Committee on Scientific Work:

Arthur J. Bedell, M.D., Albany, Chairman

David A. Haller, M.D., Rochester

Arthur M. Wright, M.D., New York

Albert D. Kaiser, M.D., Rochester

George H. Bonnefond, M.D., Utica

Irving J. Sands, M.D., Brooklyn

Richard T. Atkins, M.D., New York

Edward R. Maloney, M.D., New York

Frank W. Laidlaw, M.D., Middletown

George W. Kosmak, New York

SCIENTIFIC PROGRAM

GENERAL SESSIONS

Presiding, William D. Johnson, M. D., President, Medical Society State of New York

Tuesday, May 24th, at 2:00 P. M.

Place of Meeting, Ball Room, Hotel Statler

Address by the President of the American Medical Association, E. Starr Judd, M.D., Rochester, Minn. "Some of the Problems Associated with Peptic Ulcer." Illustrated with Lantern Slides. (By invitation.)

SYMPOSIUM ON THE THERAPEUTIC USE OF BIOLOGICAL PRODUCTS

A concise résumé of personal experiences.

Introductory remarks, William H. Park, M.D., New York City.

1. "The Serum Treatment of Poliomyelitis," William H. Park, M.D., New York City.

2. "The Serum Treatment of Meningitis," Josephine B. Neal, M.D., New York City.

3. "Antitoxin Treatment of Erysipelas," Kenneth M. Lewis, M.D., New York City.

4. "Antitoxin Treatment of Acute Gangrene," John E. Jennings, M.D., Brooklyn.

5. "Serum Treatment of Scarlet Fever," Lawrence A. Kohn, M.D., Rochester.

6. "The Use of Convalescent Serum in the Treatment of Measles, Chicken Pox and Mumps, including the Prophylactic Value of Parental Blood," Jacques M. Lewis, M.D., New York City.

Wednesday, May 25th, at 2:00 P. M.

Place of Meeting, Ball Room, Hotel Statler

A THERAPEUTIC SYMPOSIUM

1. "The Treatment of Acute Rheumatism," William W. Herrick, M.D., New York City.
2. "The Care of Coma from Unknown Cause," Emanuel D. Friedman, M.D., New York City.
3. "The Therapeutics of Hypertension," James F. Rooney, M.D., Albany.
4. "The Treatment of Common Vaginal Discharges," James E. King, M.D., Buffalo.
5. "The Treatment of Gonorrhea," Frederick J. Parmenter, M.D., Buffalo.

SECTION ON MEDICINE

Chairman.....David A. Haller, M.D., Rochester
Secretary.....Edward C. Reifenshtein, M.D., Syracuse

Tuesday, May 24th, at 10:30 A. M.

JOINT SESSION WITH SECTION ON
PEDIATRICS

Place of Meeting....Fillmore Room, Hotel Statler

1. "Prognosis of Diabetes of Childhood," Priscilla White, M.D., Boston, Mass. (By invitation.)

Discussion opened by John R. Williams, M.D., Rochester.

2. "The Clinical Results in Children of the Use of B.C.G. in New York City," Camille Kereszturi, M.D., New York City.

Discussion opened by Bela Schick, M.D., New York City, Konrad E. Birkhaug, M.D., Rochester.

Wednesday, May 25th, at 9:00 A. M.

Place of Meeting....Fillmore Room, Hotel Statler

1. "Requisite Data for Adequate Blood Sugar

Control," Floyd R. Wright, M.D., Clifton Springs.

Discussion opened by Agnes L. Brown, M.D., Rochester.

2. "Experience with a New Non-Surgical Method of Treatment for Gastric and Duodenal Ulcer," L. Winfield Kohn, M.D., New York City.

Discussion opened by Libby Pulsifer, M.D., Rochester.

3. "Effect of Liver on the Cord Lesions of Pernicious Anaemia," Paul H. Garvey, M.D., Rochester.

4. "Insulin in Hypoglycemia: Two Cases with Convulsions; One Necropsy Report," Byron D. Bowen, M.D., Buffalo, and Gilbert M. Beck, M.D., Buffalo.

Discussion opened by Charles B. F. Gibbs, M.D., Rochester.

SECTION ON SURGERY

Chairman.....Arthur M. Wright, M.D., New York City
Secretary.....Edward R. Cunniffe, M.D., New York City

Tuesday, May 24th, at 10:30 A. M.

Place of Meeting....Terrace Room, Hotel Statler

SYMPOSIUM ON EMPYÆMA

1. "Medical Aspects," John J. Rooney, M.D., Rochester.

2. "Pathology," Harrison S. Martland, M.D., Newark, N. J. (By invitation.)

3. "Surgical Treatment," Carl Eggers, M.D., New York City.

4. "Treatment by Packing," John F. Connors, M.D., New York City.

SYMPOSIUM ON ANESTHESIA

Wednesday, May 25th, at 9:00 A. M.

Place of Meeting....Terrace Room, Hotel Statler

1. "Inhalation Anaesthesia," John H. Evans, M.D., Buffalo.

2. "Avertin," Herman E. Pearce, Jr., M.D., Rochester.

3. "Sub-Arachnoid Anaesthesia," Hippolyte M. Wertheim, M.D., New York City.

4. "Experimental Studies in Sub-Arachnoid Anaesthesia," Frank CoTui, M.D., New York City. (By invitation.)

5. "Resuscitation," Paluel J. Flagg, M.D., New York City.

SECTION ON OBSTETRICS AND GYNECOLOGY

Chairman.....George H. Bonnefond, M.D., Utica
Secretary.....Edward C. Hughes, M.D., Syracuse

Tuesday, May 24th, at 10:30 A. M.

Place of Meeting.....Room 1870, Hotel Statler

1. "A Summary of the Physiology of the Female Reproduction Organs," Nathan P. Sears, M.D., Syracuse.

2. "Further Results in the Use of the Rabbit Ovulation Test for the Diagnosis of Pregnancy," Karl M. Wilson, M.D., Rochester, and George W. Corner, M.D., Rochester. (By invitation.)

Discussion opened by Francis C. Goldsborough, M.D., Buffalo.

3. "Special Functions of the Supra-renal in the Female," Frank A. Hartman, Ph.D., Buffalo. (By invitation.)

4. "The Use of the Pessary in Post-Partem Cases as a Prophylactic Measure," Louis A. Siegel, M.D., Buffalo.

Wednesday, May 25th, at 9:00 A. M.

Place of Meeting.....Room 1870, Hotel Statler

1. "Clinical Evaluation of General Hyperthermia with Heat Localization by Radiotherapy in Pelvic Inflammatory Disease," Isidor C. Rubin, M.D., New York City, and Edward A. Horowitz, M.D., New York City.

2. "The Technical Aspect of General Hyperthermia with Heat Localization by Radiotherapy in Pelvic Inflammatory Disease," William Bierman, M.D., New York City.

3. "Problems of Labor," E. Everett Bunzel, M.D., New York City.

4. "Arrested Shoulders in Vertex Presentation," Lantern slide demonstration, Mark Hornstein, M. D., New York City.

SECTION ON NEUROLOGY AND PSYCHIATRY

Chairman.....Irving J. Sands, M.D., Brooklyn
Secretary.....Henry W. Williams, M.D., Rochester

Tuesday, May 24th, at 10:30 A. M.

Place of Meeting.....Parlor B, Hotel Statler

1. "The Role of the Child Guidance Clinic in the Prevention of Schizophrenia (Dementia Praecox)," Hyman L. Levin, M.D., Buffalo.

Discussion opened by Albert B. Siewers, M.D., Syracuse.

2. "Prevention of Neuropsychiatric Problems in Municipal Employees with Special Reference to the Members of the Police Department." Sylvester R. Leahy, M.D., N. Y. City.

Discussion opened by G. Kirby Collier, M.D., Rochester.

3. "Psychoanalytic Factors in Family Discord." Clarence P. Oberndorf, M.D., N. Y. City.

Discussion opened by Philip R. Lehrman, M.D., New York City.

4. "The Scope and Limitations of a Psychoanalytic Approach to the Psychoses," Bernard Glueck, M.D., New York City.

Discussion opened by Harry A. Steckel, M.D., Syracuse.

 Syracuse, John H. Atkinson, M.D., Watertown.

3. "Diagnosis," Lantern Slide Demonstra-
 tion, Marvin F. Jones, M.D., New York City.

Discussion opened by Otto S. McKee, M.D.,
 Buffalo, Fred G. Fielding, M.D., Glens Falls.

4. "Treatment," Frank M. Sulzman, M.D.,
 Troy.

Discussion opened by Sandford H. Kinne,
 M.D., Binghamton, Austin G. Morris, M.D.,
 Rochester.

SECTION ON PUBLIC HEALTH, HYGIENE AND SANITATION

Chairman.....Frank W. Laidlaw, M.D., Middletown
 Secretary.....Daniel R. Reilly, M.D., Cortland

Tuesday, May 24th, at 10:30 A. M.

Place of Meeting.....Room 1869, Hotel Statler

1. "Poliomyelitis," A Plan for a study and
 aftercare of the 1931 Brooklyn Epidemic, Mur-
 ray B. Gordon, M.D., Brooklyn.

2. "The Epidemiology of Septic Sore
 Throat," Paul B. Brooks, M.D., Albany.

3. "Septic Sore Throat," Report of Outbreak
 in a Small Village, William L. Munson, M.D.,
 Granville.

Wednesday, May 25th, at 9:00 A. M.

Place of Meeting.....Room 1869, Hotel Statler

1. "The Significance and Detection of Tuber-

culosis in School Children," William J. Ryan,
 M.D., Pomona.

Discussion opened by Robert E. Plunkett,
 M.D., Albany.

2. "Relative Advantages of Toxin-Antitoxin
 and Toxoid," William A. Holla, M.D., White
 Plains.

General Discussion: (Participants limited to
 5 minutes each).

(a) Recent Developments in Serum therapy.

(b) The Poliomyelitis Outbreak in 1931.

(c) Problems of Rural and Small Village
 Health Officers.

SESSION ON RADIOLOGY

Chairman.....Joseph M. Steiner, M.D., New York City

Tuesday, May 24th, at 10:30 A. M.

Place of Meeting.....Room 1806, Hotel Statler

1. "The Accessory Nasal Sinuses in Scarlet Fever," Donald S. Childs, M.D., Syracuse.

2. "Roentgenological Study of Arteriosclerosis of the Aorta in Heart Disease," Lantern Slide Demonstration, Joseph H. Green, M.D., Rochester.

3. "The Correlation of Roentgenological Findings and Pathological Specimens of Gastric Cancers and Ulcers with their Differentiation," Lewis G. Cole, M.D., New York City.

4. "The X-Ray as an Aid in the Early Recognition of Serious Disease of the Colon," William H. Stewart, M.D., New York City, and H. Earl Illick, M.D., New York City.

5. "Chronic Duodenal Stasis," Ross Golden, M.D., New York City.

6. "Scope and Application of Radiation Therapy," Douglas Quick, M.D., New York City.

7. "Some X-Ray Evidences of Intracranial Pathology," Charles W. Schwartz, M.D., New York City.

8. "X-Ray Findings in the Diagnosis and Treatment of Pulmonary Tuberculosis," Lantern Slide Demonstration, Oswald R. Jones, M.D., New York City.

SESSION ON PHYSICAL THERAPY

ChairmanRichard Kovacs, M.D., New York City

Wednesday, May 25th, at 9:00 A. M.

Place of Meeting.....Room 1806, Hotel Statler

1. "Physical Therapy in Gynecological Office Practice," Virginia Tannenbaum, M.D., Buffalo.

2. "Artificial Hyperthermia by High Frequency Currents," Charles Carpenter, Ph.D., by invitation, Rochester.

3. "Painful Shoulder," Charlton Wallace, M.D., New York City.

4. "Artificial Light in Tuberculosis," George C. Martin, M.D., Buffalo.

SCIENTIFIC EXHIBIT

Foyer—Hotel Statler

NEW YORK STATE MEDICAL LIBRARY, ALBANY, N. Y.

The New York State Medical Library will have in its exhibit some recent books and current journals of general interest. One of the Librarians will be at the exhibit and will be glad to answer questions concerning the use of the Library by physicians of the State. There are over 40,000 volumes in the Medical Library at Albany and over 500 periodicals are received

currently. Special books are sent to the borrower on request or selected material will be sent if the subject desired is given. This service is extended, without charge, to physicians and nurses registered in New York State. The only obligation imposed on the borrower is the payment of the return postage and insurance.

THE CLINICAL DIAGNOSIS OF SYPHILIS

James N. Vander Veer, M.D., Albany, N. Y.; Albert Pfeiffer, M.D., Albany, N. Y.; Rudolph Ruedemann, Jr., M.D., Albany, N. Y.

The Exhibit consists of moulages demonstrating the syphilitic manifestations of skin, mucous membrane and dermatological conditions simulating syphilis.

Moving pictures will show active, early and late syphilis.

The lesions and stigmata of congenital syphilis will be demonstrated by slides.

Differential diagnosis and modern treatment will be discussed by the Exhibitors.

THE RABBIT OVULATION TEST

Karl M. Wilson, M.D., and G. W. Corner, M.D., Rochester, N. Y.

Specimens of Rabbits' ovaries showing positive and negative reactions in small jars, (3 or 4 jars).

Colored plate showing reaction. Hanging wall chart showing results.

BUFFALO CITY HOSPITAL

An Extensive Exhibit Including the Work of all Departments of the Hospital.

UNIVERSITY OF BUFFALO**THE KIDNEY OF THE LIVING ANIMAL AS SEEN UNDER THE MICROSCOPE**

J. Graham Edwards, Ph.D., University of Buffalo, Buffalo, N. Y.

The preparation shows (a) the circulation of in blood pressure. (c) The two main segments of the renal tubule and the functional differences between them.

CORTIN

Frank A. Hartman, Ph.D., University of Buffalo, Buffalo, N. Y.

The function of Cortin as demonstrated in son's disease and other clinical conditions is experiments on animals is shown by means of illustrated by photographs and charts. The therapeutic use of Cortin in Addi-

DRAWINGS OF GYNECOLOGICAL GROSS PATHOLOGY

James E. King, M.D., University of Buffalo and Buffalo General Hospital, Buffalo

Drawings of Gynecological Gross Pathology.

THE PROPHYLAXIS OF RINGWORM OF THE FEET

Earl D. Osborne, M.D., University of Buffalo Medical School, Buffalo

The exhibit will consist of photographs illustrating the use of one per cent sodium hypochlorite in rubber pans in the High Schools of the City of Buffalo. A chart showing the results of the fungicidal tests with six of the common fungus organisms will be shown. Results of two years experience will be given.

UROLOGY

Frederick J. Parmenter, M.D., Department of Urology, University of Buffalo and Buffalo General Hospital, Buffalo, N. Y.

Exhibition of Lesions of the Urinary Tract with their Symptoms and Methods of Treatment, illustrated by Charts, Specimens and Case Histories.

Topics to be covered:

Kidney Trauma

Non-Tubercular Kidney Infections
Tuberculosis of the Urinary Tract
Tumors of the Urinary Tract
Cysts of the Kidney

Ptosis and Hydronephrosis of the Kidney
Calculus of the Urinary Tract

DEACONESS HOSPITAL**THYROID EXHIBIT**

Alfred H. Noehren, M.D., E. Theodor Mueller, M.D., Oscar H. Stover, M.D., Leon H. Smith, M.D., Chester D. Moses, M.D., Elmer T. McGroder, M.D.,
Deaconess Hospital, Buffalo Thyroid Clinic, Buffalo, N. Y.

Charts showing simplified classification of goiter with histology, symptoms and treatment of each class, together with corresponding photographs of patients, pathological specimens and microscopic slides. Charts showing immediate and ultimate results of series of thyroidectomies. Moving picture of thyroidectomy.

EPITHELIOMA OF THE LARYNX

Leon H. Smith, M.D., Deaconess Hospital, Buffalo, N. Y.

Photographs of patient, one stage laryngectomy, complications, adjunct radiation therapy, micro photograph of biopsy-material, clinical cure over period of five years in man age twenty-three.

Notions, age of patient, high degree of malignancy, importance of repeated biopsies and artificial larynx.

X-RAY PRINTS OF MEDIASTINAL TUMORS

Clarence Kummer, M.D., Deaconess Hospital, Buffalo, N. Y.

X-Ray prints of eight cases of Mediastinal Tumors.

CLINICAL DAY—PRELIMINARY PROGRAM

Monday, May 23, 1932

NEW YORK STATE INSTITUTE FOR STUDY OF MALIGNANT DISEASE

9:00-12:30—

(a) Presentation of Cases of Malignant Disease: Diagnosis and Treatment, Dr. Burton Simpson, Director and Staff.

(b) Demonstration of Bone Lesions: A Comparative Study to Include Diagnostic Features Both Clinical and X-Ray. (Four lanterns will be used in this demonstration.)

(c) Inspection of the Institute: Includes Emanation Plant with Preparation of Radium Seeds, the Radium Pack and the High Voltage X-Ray.

* * *

MILLARD FILLMORE HOSPITAL

9:00-11:00—Obstetrical Clinic: Management of Dystocias, Dr. Irving Potter.

9:00-12:00—Surgical Clinic, Drs. Lothrop, Critchlow and Storck.

* * *

BUFFALO GENERAL HOSPITAL

9:30-10:30—Medical Clinic, Dr. Nelson G. Russell.

9:00-10:30—Surgical Clinic, Dr. Marshall Clinton.

10:30-12:00—Surgical Clinic, Dr. Thew Wright.

9:30-11:00—Dermatological Clinic, Dr. Earl Osborne.

10:30-12:00—Medical Conference, Drs. Aaron, Terplan and Rose.

BUFFALO CITY HOSPITAL

9:00-11:00—Surgical Management of Pulmonary Tuberculosis:

- Principles Involved
- Selection of Suitable Cases
- Results

Drs. Donnelly, Orr and Kenwell.

10:00-11:00—Medical Clinic, Dr. Thomas Walsh.

10:00-12:00—Surgical Clinic, Dr. Herbert Smith and Associates.

10:00-12:00—Gynecological Clinic: Common Cases in Practice, Dr. James E. King.

MONDAY AFTERNOON

The clinics of the afternoon will be concentrated at the Buffalo Children's, and the Buffalo City Hospital and will be continuous between two and five.

* * *

BUFFALO CHILDREN'S HOSPITAL

The work will be arranged by Dr. Harry Lohnes to include clinics in the various branches of pediatric practice.

* * *

BUFFALO CITY HOSPITAL

Clinics will be presented by certain of the Special Departments and will be especially arranged to embrace the more common conditions met with in practice.

THE TECHNICAL EXHIBITS

Booth 22—Bilhuber-Knoll Corp., Jersey City, N. J., will display a complete line of its "Council accepted" medicinal chemicals, which include some important new therapeutic agents.

The display will include regular trade packages of *Theocalcin* and of *Metraxol*. *Lenigallol* and *Lenigallol-Zinc Ointment* will be shown, and that product so widely used in scalp lotions, namely *Euresol*. *Bromural*, the sedative and hypnotic that is neither a bromide nor a barbituric acid derivative, will be on show. This is a particularly interesting product, as it is free from the state restrictions governing the barbiturates.

Booth No. 7—Cameron Surgical Specialty Co., Chicago, Ill., will exhibit "*Surgimold*," a new insulating material used on Electro-Diagnostic and Operating Instruments manufactured by the

company. This material is light in weight, sterilizable by heat, and is not affected by chemicals.

Booth 23—Crookes Laboratories, Inc., New York, N. Y., representative members of the well-known series of stable and uniform colloidal preparations for medicinal use, *Collosols*, will be featured by Crookes Laboratories, Inc. These products offer numerous advantages over similar drugs in the crystalloid form. Colloids are almost inert chemically, and may be injected without the acute discomfort and sloughing which so often follows the injection of crystalloid solutions. By reason of their slow diffusibility, they are very slowly excreted, breaking down very slowly in contact with tissues into molecules and ions, and thus exerting a prolonged therapeutic action. They possess interesting physical properties the

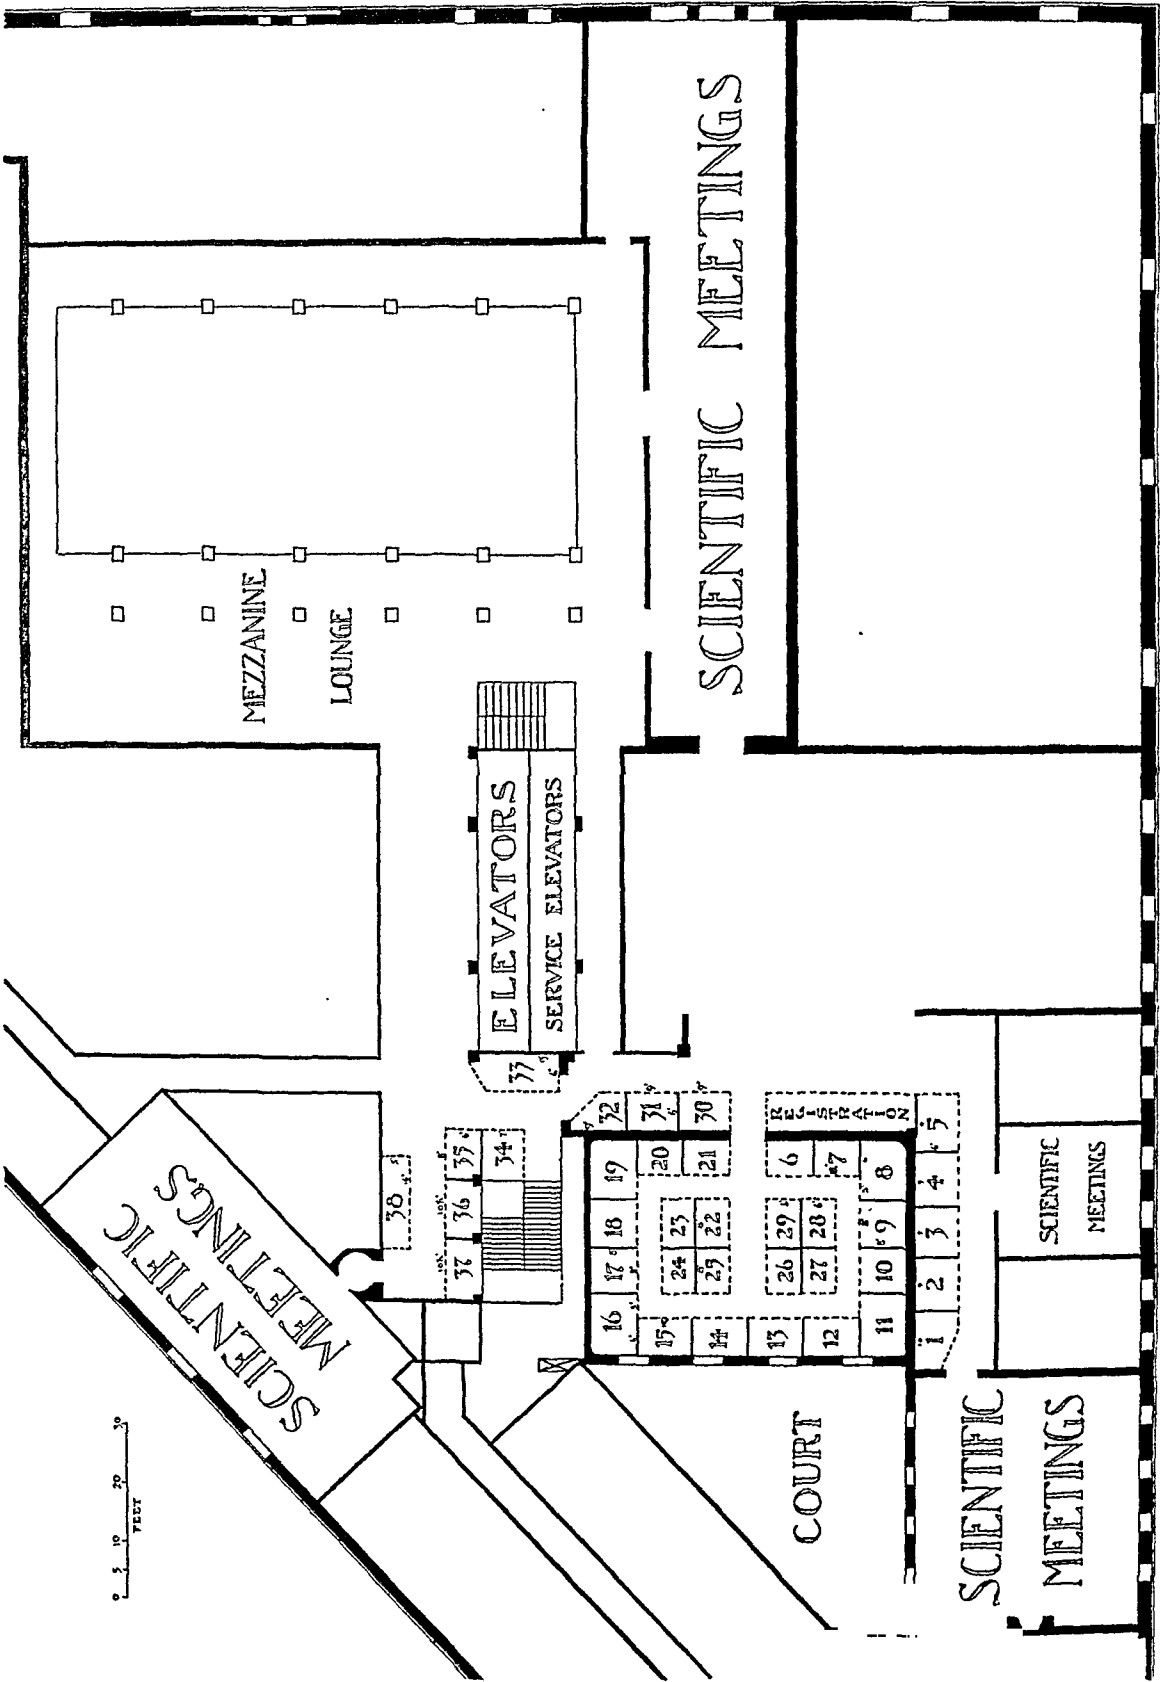

Diagram of Exhibit Hall, Hotel Statler, Buffalo, New York.
Annual Meeting, Medical Society of the State of New York, May 23-24-25, 1932

most well-known of which, the Brownian Movement, will be demonstrated by means of a dark-field microscope. A well-informed representative, Mr. S. L. Scott, will be in charge of this exhibit and will welcome the opportunity of discussing *Collosol* preparations with interested physicians and will be pleased to explain the principles involved in the therapeutic use of colloids. Samples and literature will be available.

Booth 12—R. B. Davis Co., Hoboken, N. J. Visiting physicians and their friends are invited to stop at our booth where they may secure full information relative to *Cocomalt*.

Cocomalt is a scientific food concentrate in powder form. It is a delicious food drink composed of natural food ingredients in correctly balanced proportion to provide essential elements required for the well being of the body. *Cocomalt* is prescribed and used by physicians in their private, hospital and clinical practice with a very high degree of success.

Cocomalt will be served either hot or cold to all persons in attendance so that they may judge as to "its quality and flavor."

The booth is in charge of Mr. George Dowding who will be pleased to answer questions concerning *Cocomalt*.

Booth 21—The Denver Chemical Mfg. Company, New York, N. Y., will exhibit *Antiphlogistine*. This preparation, which has been called "inflammation's antidote" and "the perfect poultice," is forty years old. It is employed by physicians in all parts of the world. There is only one way in which an ethical product can attain this distinction, and that is through merit. It is always well to remember that *Antiphlogistine* has never been successfully imitated. Physicians are invited to visit our exhibit and register for a package of *Antiphlogistine*.

Booth 26—De Vilbiss Co., Toledo, Ohio, will be welcomed as an old friend of physicians. The Company will demonstrate its well-known line of atomizers.

Booth 17—Ferment Company, New York, N. Y., will demonstrate its acidophilus milk, and explain the standard method of its use in correcting intestinal putrefaction.

Booth 29—The General Electric X-Ray Corporation, Rochester, N. Y., will exhibit radiographs made with the new KX-1, KX-2 and KX-4 (*Kenotron*) equipment. This exhibit will consist of radiographs of different parts of the body, showing the ease of duplication and marvellous control of this latest most useful development of the *General Electric X-Ray Corporation's Research Laboratories*. This equipment

promises a new era in x-ray. Complete details will be obtainable at our booth.

New *Physical Therapy* developments will be displayed, among which will be the new *Victor Electro Surgical Unit* with the exclusive three-step foot control, making it possible for the surgeon to have direct control of current intensity while operating, without the need of help from trained technical assistants.

A trained technical staff will be in attendance at the booth throughout the meeting.

Booth 36—The Gerber Products Division of the Fremont Canning Company, Fremont, Michigan. The unseasoned, strained vegetables of the Gerber Products Division are of interest because they offer an opportunity for better control of infant and special diets, and insure uniformity in feedings and diets.

Visitors at the Gerber Products booth will be given any information wanted concerning the special process used in the manufacture of these products.

New booklets are available: one on infant feeding for distribution by physicians in their practice; and one on therapeutic diets for professional use.

Booth 30—Kalak Water Co., New York, N. Y. Doctors that are faced with the problem of maintaining normal water and alkali balances in patients under treatment should visit booth No. 30 and discuss this problem with the Kalak representative.

The Kalak formula presents a chemical balance of essential alkalizing salts as a properly carbonated non-laxative water that is delicious and refreshing to the patient.

Booth 25—The Kellogg Company, Battle Creek, Michigan, will serve Kaffee Hag Coffee with *All-Bran Muffins* to visitors at its booth.

Kaffee Hag Coffee is a blend of fine coffees from which ninety-seven per cent of the caffeine, together with the indigestible wax have been removed. The fine flavor and aroma are not impaired and doctors will find *Kaffee Hag Coffee* a satisfactory non-stimulating beverage to suggest for special diets.

Kellogg's All-Bran contains valuable quantities of assimilable iron and Vitamin B, and because of its bulk, is valuable in correcting cases of atonic constipation.

Mrs. Mildred Day from the Home Economics Department will be in charge of the exhibit.

Booth 31—Mellin's Food Company, Boston, Mass. The source, nature and amount of nutritive elements that enter into the making of *Mellin's Food*, the composition of the finished product, the caloric value of various quantities

by weight and by measure, and what *Mellin's Food* accomplishes as a modifier of milk in the feeding of infants and adults, are subject matters for discussion at the booth of the company. All physicians are cordially invited to call, to ask questions, and to offer suggestions that will lead to a thorough understanding of *Mellin's Food* and its purpose.

Booth 28—Merck & Co., Inc., Rahway, N. J., include in its display such well-known preparations as *Pyridium*, *Arsphenamines*, *Tryparsamide*, *Stovarsol*, *Digitan*, *Erythrol*, *Tetranitrate*, *Arsenoferrato*se and *Bismosol*.

The oral administration of *Pyridium* affords a quick and convenient method of obtaining bactericidal action when treating gonorrhea, pyelitis and other genito-urinary infections.

In neurosyphilis the use of *Tryparsamide* should have first consideration. The treatment is inexpensive; does not disrupt the patient's daily routine of life, and is available through the services of his personal physician. The testing of the *Arsphenamines* manufactured by Merck includes a "clinical control" of every lot.

Messrs. Ackerman, Gaffney, and Reilly will be in charge of the Merck products—Booth No. 28.

Booth 6—Mutual Pharmacal Co., Syracuse, N. Y., will exhibit samples of U.S.P. drugs in forms which are pleasing and dependable.

Booth 24—The New York Physicians' Mutual Aid Association, New York, N. Y. In 1868 a group of physicians organized and incorporated *The New York Physicians' Mutual Aid Association*, to have for its objects:

(a) To pay death benefits to the estates of deceased members or to designated beneficiaries, and

(b) To furnish pecuniary aid to members in cases of urgent need.

The founders builded better than they knew, for from their small beginning of less than a hundred members there has grown our Association whose membership now is in the thousands, and which increased by 124 members, despite the financial depression of 1931, an excellent showing because in the past two years the medical man like other workers, has tried to decrease, rather than increase his expenses.

This Association makes no distinction as to sex, race, creed, or color, welcoming all that are eligible to its membership at the actual cost of the service it performs. Its officers and trustees receive no salaries or other financial recompense, feeling honored in being chosen by their colleagues to manage its affairs. They are elected each year at the annual meeting of the Association. Information may be had from the headquarters of the Association, New York Academy

of Medicine, 2 East 103rd Street, New York City.

Booth 38—James Picker, Inc., Cleveland, Ohio. The joint exhibit of *Picker X-ray Corp.* and *Waite & Bartlett X-ray Mfg. Company* will feature a complete line of shockproof x-ray equipment.

Dr. H. F. Waite, president of *Waite & Bartlett X-ray Mfg. Company*, is the inventor of oil immersed shockproof x-ray apparatus. However, the efforts of the Waite organization have by no means been confined to shockproof equipment of this one particular type, and the company has available today a complete line of shockproof equipment utilizing a number of different shockproof features. Among other items exhibited will be the *shockproof fluoroscope*, which is fully protected whether energized by its own power plant or connected to an overhead aerial system.

This exhibit will also feature a line of *Waite valve tube rectified apparatus* incorporating oil sealed rectification, a design exclusive in Waite equipment.

Booth 5—Charles H. Phillips Chemical Co., New York, N. Y. *Effective, palatable, convenient*—these qualities are typified in *Phillips' Milk of Magnesia Tablets*.

Each tablet contains 4.8 grains of freshly precipitated Magnesium Hydroxide-Mg(OH)₂ in its highest purity, the magnesia equivalent of one teaspoonful of *Genuine Phillips' Milk of Magnesia*. All the therapeutic effects of *Genuine Phillips' Milk of Magnesia* can now be obtained in the form of a friable mint-flavored tablet which rapidly disintegrates in the mouth or stomach and produces prompt results. Samples available at space No. 5.

Booth 33—Saratoga Springs Commission, Saratoga Springs, N. Y. The work that has already been done on the State-owned spa at Saratoga Springs, New York, and the work that is under way for its further development, will be graphically displayed at the annual meeting of the State Society. One of the large booths on the convention floor of the Hotel Statler will be given over to this display. Large photographs of the two great bath houses, the Lincoln and the Washington, already in operation by the State, and of scenes in the beautiful 1,000 acre reservation surrounding them will adorn the walls of the booth. There will also be perspective and ground views of the plans drawn by Joseph H. Freedlander, the architect of the Commission, for the development in Geyser Park on which work was begun this spring. The two buildings first to be erected in this development are the \$900,000 Hall of Springs, and the \$400,000 laboratory and administration building. Contracts for the former have

been let and contracts for the latter will be during the summer.

The Saratoga Springs Commission display also will include the service of the widely known naturally carbonated *Geyser water*, which is bottled and distributed by the State. Delegates and professional visitors to the meeting will be invited to have samples of *Geyser water* and of *Hathorn water* sent to their homes.

Booth 34—S. M. A. Corporation, Cleveland, Ohio, will display its powdered milk for infant feeding, and will explain its adaptations in all conditions, including sensitiveness to the protein of cow's milk.

Booth 15—E. R. Squibb & Sons, New York, N. Y. The New York physicians attending the meeting of the Medical Society of the State of New York will find much of interest at the Squibb Exhibit Booth No. 15. Among the products which will be particularly featured will be *Iodobismitol*, the new antisyphilitic preparation developed by Drs. Hanzlik, Mehrrens and associates, of Stanford University, and which is distributed only by E. R. Squibb & Sons under license from that institution. The other products featured will include *Squibb Adex Tablets*, which contain a concentrate of the vitamins of *Squibb Cod-liver Oil with Viosterol*—10 D, and *Squibb Chocolate-Vitavose*. Many physicians will be interested in *serenium*, a chemo-therapeutic agent for the treatment of genito-urinary infections. There will also be on display *Follutein*, a physiologically tested preparation of the anterior pituitary sex hormones. A complete line of *Squibb Vitamin Glandular, Arsenical*, and *Biological Products* will be exhibited, and competent attendants will be present to furnish any information concerning these and other Squibb products.

Booth 35—Tailby-Nason Co., Boston, Mass. Tailby-Nason Company of Boston again present *Nason's Palatable Cod Liver Oil*. Real fishing scenes from the Lofoten Islands of Norway where Nason's Plants are located are on exhibit. The *Giant Cod* is also on hand to greet you.

Booth 32—George Tiemann & Co., New York, N. Y. Besides the usual line of fine surgical instruments, George Tiemann and Company will this year again exhibit some of the newer developments since the last annual meeting. The

wide-spread interest in the use of living sutures, make the *Grace Fascia Stripper*, and the *Gratz Fascia Needle* particularly interesting.

Some of the other new items are the instruments used by Dr. Jamison in his recession operation; also the new pharyngeal dilators so successfully used by Dr. Yankauer.

The new *Bailey Chlodian Forceps*, the *Montague Rectal Speculum* and a *hypodermic needle* made of a newly developed stainless steel which will not break, has superior stainless qualities and has a supersmooth surface, will also be interesting exhibits.

Booth 10—The Westinghouse X-Ray Company, Rochester, N. Y., will have on display at the forthcoming meeting several items of equipment of major interest at the present time to the medical profession.

The Model F *Endotherm*, now in use in many leading hospitals, will be exhibited in a cabinet model for office use. New instruments for tonsil coagulation, cognization of the servix and excision of the prostate will be shown in connection with the *Endothermy* equipment.

Probably of greatest interest will be the new Westinghouse No. 4 *Diathermy Apparatus*, a recent product of the Westinghouse research laboratory, which, it is claimed, eliminates all possibility of obtaining any faradic sensation during diathermy treatments irrespective of settings or manipulation of controls.

The exhibit will also include a display of *Westinghouse Diagnostic and Therapy X-ray Tubes* and the new *Grenz Ray Apparatus*.

Booth 4—Winthrop Chemical Co., and H. A. Metz Laboratories, New York, N. Y., have a diversified and interesting display which includes painless retrograde pyelography with *Skiodan*; clinical material on the treatment of syphilis with the *Salvarsans*, including *Silver Salvarsan*; a wide range of synthetic sedatives and hypnotics to meet various degrees and types of neurosis, *Luminal Adalin*, *Phanodorn* (the new hypnotic), etc.; *Suprarenin*, the synthetic epinephrine; *Oscodal*, the first cod liver oil concentrate; *Novocain*, including crystals for spinal anesthesia; *Salrgan* and *Theocin*, the new diuretics; *Pyramidon*, the valuable analgesic antipyretic; and other items of interest to the specialist and general practitioner.

by weight and by measure, and what *Mellin's Food* accomplishes as a modifier of milk in the feeding of infants and adults, are subject matters for discussion at the booth of the company. All physicians are cordially invited to call, to ask questions, and to offer suggestions that will lead to a thorough understanding of *Mellin's Food* and its purpose.

Booth 28—Merck & Co., Inc., Rahway, N. J., include in its display such well-known preparations as *Pyridium*, *Arsphenamines*, *Tryparsamide*, *Stovarsol*, *Digitan*, *Erythrol*, *Telranitrate*, *Arsenoferratoze* and *Bismosol*.

The oral administration of *Pyridium* affords a quick and convenient method of obtaining bactericidal action when treating gonorrhea, pyelitis and other genito-urinary infections.

In neurosyphilis the use of *Tryparsamide* should have first consideration. The treatment is inexpensive; does not disrupt the patient's daily routine of life, and is available through the services of his personal physician. The testing of the *Arsphenamines* manufactured by Merck includes a "clinical control" of every lot.

Messrs. Ackerman, Gaffney, and Reilly will be in charge of the Merck products—Booth No. 28.

Booth 6—Mutual Pharmacal Co., Syracuse, N. Y., will exhibit samples of U.S.P. drugs in forms which are pleasing and dependable.

Booth 24—The New York Physicians' Mutual Aid Association, New York, N. Y. In 1868 a group of physicians organized and incorporated *The New York Physicians' Mutual Aid Association*, to have for its objects:

(a) To pay death benefits to the estates of deceased members or to designated beneficiaries, and

(b) To furnish pecuniary aid to members in cases of urgent need.

The founders builded better than they knew, for from their small beginning of less than a hundred members there has grown our Association whose membership now is in the thousands, and which increased by 124 members, despite the financial depression of 1931, an excellent showing because in the past two years the medical man like other workers, has tried to decrease, rather than increase his expenses.

This Association makes no distinction as to sex, race, creed, or color, welcoming all that are eligible to its membership at the actual cost of the service it performs. Its officers and trustees receive no salaries or other financial recompense, feeling honored in being chosen by their colleagues to manage its affairs. They are elected each year at the annual meeting of the Association. Information may be had from the headquarters of the Association, New York Academy

of Medicine, 2 East 103rd Street, New York City.

Booth 38—James Picker, Inc., Cleveland, Ohio. The joint exhibit of Picker X-ray Corp. and Waite & Bartlett X-ray Mfg. Company will feature a complete line of shockproof x-ray equipment.

Dr. H. F. Waite, president of Waite & Bartlett X-ray Mfg. Company, is the inventor of oil immersed shockproof x-ray apparatus. However, the efforts of the Waite organization have by no means been confined to shockproof equipment of this one particular type, and the company has available today a complete line of shockproof equipment utilizing a number of different shockproof features. Among other items exhibited will be the *shockproof fluoroscope*, which is fully protected whether energized by its own power plant or connected to an overhead aerial system.

This exhibit will also feature a line of *Waite valve tube rectified apparatus* incorporating oil sealed rectification, a design exclusive in Waite equipment.

Booth 5—Charles H. Phillips Chemical Co., New York, N. Y. *Effective, palatable, convenient*—these qualities are typified in *Phillips' Milk of Magnesia Tablets*.

Each tablet contains 4.8 grains of freshly precipitated Magnesium Hydroxide-Mg(OH)₂ in its highest purity, the magnesia equivalent of one teaspoonful of *Genuine Phillips' Milk of Magnesia*. All the therapeutic effects of *Genuine Phillips' Milk of Magnesia* can now be obtained in the form of a friable mint-flavored tablet which rapidly disintegrates in the mouth or stomach and produces prompt results. Samples available at space No. 5.

Booth 33—Saratoga Springs Commission, Saratoga Springs, N. Y. The work that has already been done on the State-owned spa at Saratoga Springs, New York, and the work that is under way for its further development, will be graphically displayed at the annual meeting of the State Society. One of the large booths on the convention floor of the Hotel Statler will be given over to this display. Large photographs of the two great bath houses, the Lincoln and the Washington, already in operation by the State, and of scenes in the beautiful 1,000 acre reservation surrounding them will adorn the walls of the booth. There will also be perspective and ground views of the plans drawn by Joseph H. Freedlander, the architect of the Commission, for the development in Geyser Park on which work was begun this spring. The two buildings first to be erected in this development are the \$900,000 Hall of Springs, and the \$400,000 laboratory and administration building. Contracts for the former have

duction. Our committee's work in this direction should be extended. A4.

9. All of these items are relevant, material, and competent to the question of "what constitutes a fair and reasonable income for a doctor?" Our work may be ever so *noble* with a high yield of personal gratification. But it is sheer hypocrisy to allege that our labors are free and independent of any thought of financial reward. It is the "love" of money and not money that is the root of all evil. A fair wage for honest labor is honorable and good economic sense. Our problem is the provision of adequate, available care within the financial range of the average citizen—with-out paternalism or communism. A2, A77, A48.

10. The problem of the shortage of physicians in rural communities can be explained most reasonably by the fact that few men, with large investments, will locate where the probability of fair returns is impossible.

11. These discussions lead to the question of the economic soundness of our present system of medical education.

(a) Should scholastic idealism make concessions to economic expediency? A46.

(b) Does the student physician labor too long on a purely speculative relationship to his true objectives?

(c) Can the program be rearranged to introduce more realism into his intellectual growth?

(d) Is the continued status of "dependent" detrimental to the better development of professional character?

(e) Does society owe the youngster the opportunity to earn as he learns? The opportunity to live and grow more gradually into a professional man? Would the years of study be extended by such program?

(f) Would a program of progressive degrees and probationary licensure spread out the study-time and prove economically preferable to the present system? Certainly this would offer an improvement in the gratification of the almost universal desire for alphabetical decoration and *distinction, which now prevails—and the distinction would be more significant.*

(g) Qualification for specialists. A2, A48.

12. It seems sound economics that when any enterprise does not accumulate a "good will" value with salable tangible assets, then that enterprise, in the span of its existence, should return the original investment. A2.

13. Income tax authorities allow depreciation on equipment. Should we seek an "amortization" allowance on the intellectual equipment? This would be good public policy since it would encourage ample investment in professional education.

In his student and intern years, the physician has labored with a constant "outgo" where others enjoy an "income." Is it not simple fairness to

argue for credit for the accumulation of deferred "income allowances"?

14. We recommend:

(a) That the succeeding committee on Medical Economics be instructed to continue the study and report of paragraphs 6, 7, 8, and 9.

(b) That in the composition of the budget the Trustees give consideration to the costs incident to these studies.

(c) That the Committee on Public Health and Medical Education and the Committee on Medical Economics jointly consider paragraphs 10 and 11.

(d) That the Committee on Medical Economics investigate the possibility of a new departmental ruling concerning the allowance on amortization on intellectual equipment. Paragraphs 12 and 13.

COST OF "MAINTENANCE AND DELIVERY"

15. What is the average daily expense of maintenance and delivery of a physician's services?

What is the average cost of a consultation in the office, home of the patient, and in the hospital? A5.

Nobody knows.

16. It has been authoritatively established that it costs from \$94 to \$1.26 for a visiting nurse to make a call upon a patient. What does it cost a physician to visit a patient? A new book, dealing with the "cost analysis" of public health nursing, gives the picture of the development of this study over a period of ten years. There is much food for thought in this book; and some consolation to your Committee. The results of our brief effort do not seem so small. A6, A7.

17. Thru a questionnaire, addressed to each County Committee, we undertook to learn the average expense of our members. From a few of the Counties the response was excellent; from some we have had no reply; and from two, New York and Monroe, came refusals to cooperate. A5.

18. In a cursory reading of "the methods of computation" followed in the cost analysis of nursing, it becomes evident that we shall require study, time and money to make a thorough job of "cost analysis" of medical service. Need of such study from the physician's point of view becomes imperative when we contemplate the activities of others along a similar line—the field work of which is being done under the guidance of a "public health economist" and under the supervision of "public health nurses." A6, A33, A53.

19. Pending the more complete study, a circular questionnaire to each of our members for "income tax data" would provide valuable material quickly, and at minimum expense.

20. The economics of office equipment, office administration, and kindred matters deserve consideration. Doctors need constant inspiration and

REPORT OF
THE COMMITTEE ON MEDICAL ECONOMICS

To: *The House of Delegates.*

Gentlemen:

The Committee on Medical Economics respectfully submits the following record of its activities for the current year.

1. *This Report.* First comes a statement of organization, work-plan, a retrospect of our efforts, a prospect of medical economics. And then follows the discussion of our work-plan topics, with results of our observations and deliberations, suggestions for further investigations, proposed pronouncements of principles, and our specific recommendations.

THE CONTENTS OF THE REPORT

	Paragraphs
Organization, Work-Plan, Retrospect, Prospect	2-5
What Does It Cost to Produce a Doctor?	6-14
Cost of "Maintenance and Delivery" of Medical Service	15-21
Economics of Hospitalization	22-56
"Outlet Field" for Medical Knowledge..	57-61
Commercialized and Industrialized Medicine, Congregated, Syndicated, Incorporated, Industrial, Competition, Workmen's Compensation	62-90
Public Health and Individualized Medical Service by Public Agencies	91-97
Public-Poor. Medical Charity. Exploitation of Physicians	98-104
Financing of Sick Care. Credit Losses, and Collection Agents	105-125
Socialization, Paternalism and Medicine. Economics of "Public Health Graduates" and the Foundations in Sick Care. "Cost of Medical Care Survey" ..	126-140
Physicians and Courts. The Negligence Cases	141-149
Practice of the Medical Arts by Corporations	150-154
Organized Medicine. Administration Machinery	155-158
Program to Bring Local County Economics Committee into Active Life	159-161
Peroration	162-163

"A" followed by a numeral refers to the bibliography at the end of the report.

2. *Organization.* The standing committee and the auxiliary have been in fact one committee, organized as such June 30th, 1931. Four meetings have been held in Albany and two in New York. Attendance, average for year, over 80 per cent.

3. *Work Plan.* The meaning and scope of *economics* as applied to our duties was accepted in the wider modern ideology of the term—"The study of problems and the science of principles

connected with the growth and well-being of organized society." A46, A88.

We were without inheritance from the work of previous committees other than information from their annual reports; without instructions from this House; and without adequate and authentic data upon which to proceed with the study of any problems. A60.

We first discussed an outline or general scheme for the survey of the economics of medicine. A1.

This plan presents an array of obvious objectives which no committee could hope to attain within the span of one year. It was adopted with the thought that in it we might develop an orderly program upon which our efforts and the work of our successors could realize a tangible and permanent gain in this field.

4. *In Retrospect.* Reflecting upon the work of the year, now as at the beginning, we are conscious of the very great need for the accumulation of a library of factual data. Our accomplishments are diminutive when compared with our ambitions and the challenges of present day circumstances. At least, we have undertaken to lay a foundation, and in many ways to suggest the architecture of the structure to be erected above it.

5. *In Prospect.* If the physician is to hold his place in organized society there must be a better planned unity and continuity of thought among doctors. There must be clearer orientation within the profession and between Medicine and Society. Society is in the process of advolitional growth. Economic readjustments, in particular, are in the making. We have a responsibility to shape that growth. A2.

If collectively we shirk that civic-social obligation, we individually shall suffer loss of economic security and justice. We must choose to play a master part in the community life or accept the humble servant's lot. There is no middle ground. A44.

WHAT DOES IT COST TO PRODUCE A DOCTOR?

6. A medical education has a cost in money and labor. A healthy relation between "investment and return" is necessary to growth and healthy intellectual and moral fiber in the medical profession. A2, A87.

7. Calculation of the cash outlay incident to the actual study of medicine has been very ably undertaken by our sub-committee. A3, A17.

8. Accruals for the years of sustained effort rendered with no direct or immediate financial return, and accruals for deferred return on investment are properly chargeable to the cost of pro-

duction Our committee's work in this direction should be extended A4

9. All of these items are relevant, material, and competent to the question of "what constitutes a fair and reasonable income for a doctor?" Our work may be ever so *noble* with a high yield of personal gratification But it is sheer hypocrisy to allege that our labors are free and independent of any thought of financial reward It is the "love" of money and not money that is the root of all evil A fair wage for honest labor is honorable and good economic sense Our problem is the provision of adequate, available care within the financial range of the average citizen—without paternalism or communism A2, A77, A48

10. The problem of the shortage of physicians in rural communities can be explained most reasonably by the fact that few men, with large investments, will locate where the probability of fair returns is impossible

11. These discussions lead to the question of the economic soundness of our present system of medical education

(a) Should scholastic idealism make concessions to economic expediency? A46

(b) Does the student physician labor too long on a purely speculative relationship to his true objectives?

(c) Can the program be rearranged to introduce more realism into his intellectual growth?

(d) Is the continued status of "dependent" detrimental to the better development of professional character?

(e) Does society owe the youngster the opportunity to earn as he learns? The opportunity to live and grow more gradually into a professional man? Would the years of study be extended by such program?

(f) Would a program of progressive degrees and probationary licensure spread out the study-time and prove economically preferable to the present system? Certainly this would offer an improvement in the gratification of the almost universal desire for alphabetical decoration and distinction, which now prevails—and the distinction would be more significant

(g) Qualification for specialists A2, A48

12. It seems sound economics that when any enterprise does not accumulate a "good will" value with salable tangible assets, then that enterprise, in the span of its existence, should return the original investment A2

13. Income tax authorities allow depreciation on equipment Should we seek an "amortization" allowance on the intellectual equipment? This would be good public policy since it would encourage ample investment in professional education

In his student and intern years the physician has labored with a constant "outgo" where others enjoy an "income" Is it not simple fairness to

argue for credit for the accumulation of deferred "income allowances"?

14. We recommend

(a) That the succeeding committee on Medical Economics be instructed to continue the study and report of paragraphs 6, 7, 8, and 9

(b) That in the composition of the budget the Trustees give consideration to the costs incident to these studies

(c) That the Committee on Public Health and Medical Education and the Committee on Medical Economics jointly consider paragraphs 10 and 11

(d) That the Committee on Medical Economics investigate the possibility of a new departmental ruling concerning the allowance on amortization on intellectual equipment Paragraphs 12 and 13

COST OF "MAINTENANCE AND DELIVERY"

15. What is the average daily expense of maintenance and delivery of a physician's services?

What is the average cost of a consultation in the office, home of the patient, and in the hospital? A5

Nobody knows

16. It has been authoritatively established that it costs from \$94 to \$126 for a visiting nurse to make a call upon a patient What does it cost a physician to visit a patient? A new book, dealing with the "cost analysis" of public health nursing, gives the picture of the development of this study over a period of ten years There is much food for thought in this book, and some consolation to your Committee The results of our brief effort do not seem so small A6, A7

17. Thru a questionnaire addressed to each County Committee, we undertook to learn the average expense of our members From a few of the Counties the response was excellent, from some we have had no reply, and from two, New York and Monroe, came refusals to cooperate A5

18. In a cursory reading of "the methods of computation" followed in the cost analysis of nursing, it becomes evident that we shall require study, time and money to make a thorough job of "cost analysis" of medical service Need of such study from the physician's point of view becomes imperative when we contemplate the activities of others along a similar line—the field work of which is being done under the guidance of a "public health economist" and under the supervision of "public health nurses" A6, A33, A53

19. Pending the more complete study, a circular questionnaire to each of our members for "income tax data" would provide valuable material quickly, and at minimum expense

20. The economics of office equipment, office administration, and kindred matters deserve consideration Doctors need constant inspiration and

suggestions in this direction. We have made little progress in broadcasting such thoughts. A9, A44.

21. We recommend:

(a) That the Committee on Medical Economics be authorized to question by individual circular letter and card.—Paragraph 19.

(b) That the Committee on Medical Economics submit a plan for "cost analysis" of medical service to the next House of Delegates.—Paragraphs 15, 16, 18.

(c) That the Committee on Medical Economics provide the editor of the Journal with suitable articles for publication in the Journal.—Paragraph 20.

ECONOMICS OF HOSPITALIZATION

22. Hospitalization of the sick is a composite function consisting of three elements. Hotel accommodations, nursing care, and medical service.

23. *Hospital.* Coordination of these three activities is properly reposed in a board of administration. Its composition and the scope and limitation of its duties are of economic interest.

24. Institutions prosper and grow under ownership and administration of physicians. They pay real estate tax and assessments, State and Federal Income Taxes, and interest on mortgages and invested capital. Yet, without solicitation of donations, they render equal service and compete successfully with their tax-exempted neighbors. Comparison of efficiency of administration is economic and pertinent. The medically trained mind is competent to evaluate the essential in expenditures of funds and in the adjustment of means to ends. A2, A10.

25. Therefore, at least thirty-three per cent of all boards of administration should be medical men, representing, if possible, all of the types of medical service carried on in the institution. A5.

26. The duties of such board should be custodial as to property, and a coordinating supervision of activities. The existence of a hotel-hospital is justified only as an auxiliary to augment the efficiency of medical care. This fact defines the natural limitation of the Board's prerogatives: paragraph 32 defines its limitations as to Medical Staff. A2.

27. Since the hospital is virtually a hotel for the sick and injured, its superintendent is practically a hotel manager. He is the executive officer to carry out orders and regulations of the governing board and its medical staff. Dictatorial intrusion into matters of medical practice or organization on the medical staff is a violation of principles hereinafter (paragraph 32) stated. A2, A11, A85.

The executive officer, superintendent, should be a graduate in medicine with some clinical experience—if the size of the institution permits. Smaller institutions, operating under a nurse or lay person, should have one member of the medi-

cal staff elected as "Councilor to the Superintendent," who shall function to give medical orientation to the solution of executive problems. A5.

28. Originating as a refuge for the sick traveler, wayfarer, friendless and the homeless, the idea of hospitalization has been inseparably confused with the idea of charity. On this premise abuses have grown. Money raised in the name of charity is not always spent judiciously; yet, in the public mind it is subconsciously charged up to medical care. Every individual serving in the hospital is compensated for his labor, except the physician. A8, A12, A36.

29. Moneys raised for charity should be segregated and paid from that account to the hospital general treasury, if, as and when charitable care and accommodation is rendered. Losses through wasteful and incompetent administration are not a proper charge against funds raised for charity, nor are they a proper charge against the cost of medical care. A2.

30. All hospitals, erected or maintained in whole or in part by the public, whether with money from the public treasury or raised by general public solicitation, are in fact public institutions and alike in their obligations.

31. Such hospitals are naturally obligated:

To provide accommodations for sick care without special privilege to any class;

To provide to the medical profession of the community equal opportunity in the pursuit of the practice of medicine; and equal opportunity to improve in the knowledge and skill of medical practice;

To recognize the layman's natural right of free choice of physician, such right not to be abridged by pretext or over zeal in the supervision of medical practice.

These obligations subject only to such qualifications as are stated in paragraph 32 of this report.

32. Professional eligibility, organization, discipline, promotions and demotions, and all measures, rules, etc., regulatory to the practice of medicine with the hospital, are properly the function of organized medicine, as represented by the local County unit or other incorporated medical body, or the medical staff of an established and going institution; who should have the full and sole responsibility and power in such matters. Paragraphs 46, 47, and 48.

33. We recommend:

(a) That paragraphs 22, 23, 25, 26, 27, 29, 30, 31 and 32 be pronounced the expressed thought and opinion of organized medicine in this State.

(b) That these principles (a) be recommended to the consideration of all authorities engaged in the grading or classification of sick-care institutions.

(c) That a general acceptance of paragraphs 30, 31 and 32 be urged, by the exercise of all reasonable and proper pressure within our power, upon all governing authorities, especially upon the Heads of Departments of Hospitals and of Health of the State, Counties and Municipalities

(d) That the methods of hospital accounting be the subject of study, paragraphs 24, 29, by the Committee on Medical Economics

34. Nurse. The profession of graduate nurse made its advent into the field of sick-care less than 70 years ago. In the original concept it was intended to provide expert assistance to be complementary to the physician's services A13

35. The development of the "training program" and the extroverted expansion of the psychology of nursing, and the study of the cost of sick care raise certain economic questions A13, A14, A51

36. Should the "cost of medical care" carry the cost of education and training of the nurse, —the price of her education? Does the student-nurse at this time render services adequately to compensate for her food, clothing, shelter, and schooling? A5

37. The regulation of details of nurse training by a centralized authority through long distance remote control, without personal contact knowledge of, and regard for, the variations in local conditions, leads to much lost motion in the practical work of sick care. It distorts and often defeats efficiency and economy of administration by the local hospital heads, and accordingly is wasteful and unsound A5, A13, A51, A55

38. The constant interruption going and coming, for classes, time off, quizzes, etc., incident to zealous compliance with exacting rules results in a transcendental position of nurse training to the real objectives, sick-care and assistance to the physicians. Care of the sick, not technical training, is the primary and paramount aim of hospitalization A5, A13, A56

39. Didactic instruction, therefore, should be given more intensively and apart from practical training. The training will be more effective if student attention is not subjected to constant interruption and irregularity of application A5

40. The desertion of the Nightingale philosophy for an acquisitive purpose is condemned. On the other hand, a proper reward for good service and reasonable regard for the "investment" in expert training should be insured insofar as we may influence it A7, A13

41. Out of the transcendency of "training" in counter point to actual sick care, there is a growing idea of professional equality. An idea of equal importance in the program of sick care subverts subordination to authority. If the doctor accepts the denial of his ranking position he must expect the repudiation of his absolute authority. Without discipline in the sick room and in the

hospital, can we discharge our entire obligation to the patient?

42. The increasing number of "specials" has added material burdens to the expense of sick-care A13, A14, A15, A39. Here are a number of pertinent questions

(a) At what price per bed or per room, should a patient receive that nurse-service which precludes the necessity for a special nurse?

(b) Do ward patients take the time of the floor nurse to the neglect of the private room patient?

(c) Is this increased call for specials the sign of a gradual let-down in the regular floor nurse service?

(d) Is such let down, if any, the result of un-economic administration?

(e) How often is the "special" suggested to the family, as a hand-out to the unemployed?

(f) How often is the demand for a special merely the emotional or theatriac reaction on the part of the family to surgical medicine?

(g) Where is the dividing line between necessity and luxury? Should the attending physician be the judge of need for special nursing?

(h) Is it sound economics to permit the dissipation of the patient's resources for luxury nursing service, at the possible or probable sacrifice of a prompt, just compensation to the physician?

(i) The "eight hour day" for specials is being widely discussed. The economics of it must be studied

43. For the type of patient whose affliction is not hazardous, who needs simple attendant care we should take steps to provide an attendant with sufficient training to the purpose. Such person would be qualified to better service than the untrained "practical nurse" and would work at a price within the pocket-book range of the average citizen A5, A14, A49

44. We should return the supervision of this training within the hands of local organized medicine to be directed to the exact needs of the locality A49

45. We recommend

(a) That paragraphs 34, 37, 38, 39, 40 and 41 be pronounced the expressed thought and opinion of organized medicine in this State

(b) That paragraphs 36 and 41 be referred to the Committees on Nurse Education and Medical Economics for joint consideration and specific recommendations

(c) That paragraphs 43 and 44 receive further study and joint consideration of the Committee on Medical Economics and the Committee on Public Health and Education

(d) That the Committee on Medical Economics continue analytic and statistical study of the "special" nurse problem and report at the next annual meeting—Paragraph 42

46. *Medical Service.* Hospitalization has one true objective. This is service to the sick and injured. To this the entire personnel are alike obligated and committed.

47. Medical intelligence, as represented in the personnel of the medical staff, must be the pre-dominant factor in this formulæ of forces. It is the guiding, essential force. A8.

48. The creation, the culture and the promotion of effective use of this intelligence is the prime economic aim. In its fulfillment, the hospital is destined to be both benefactor and beneficiary. The physician, because he is the personification of that intelligence, must command all other persons in the organization; to his intelligence they must concede subordination. This principle is necessary to discipline and an orderly coordination of efforts. A2, A13.

49. A casual observation in the daily life of almost any general private hospital will prompt certain economic questions:

(a) What is being done to conserve the time and energies of the physician—the most highly specialized and the most costly and the most difficultly produced unit of the whole “set up”?

(b) Is the vast amount of “paper clerk” work, exacted of him, a sound economic regulation?

(c) Should we distinguish between the minutiae of a research laboratory work-sheet and the mere notation of facts, to satisfy the purposes of an applied practice? Should we have more common sense and fair appreciation of what is essential in the composition of a chart record?

(d) Should our methods of making records be revised with the introduction of trained typists and the elimination of the illegible scrawls?

(e) Should there be a universal adoption of a system of records suited to “machine analysis”?

(f) What percent of the charts so laboriously compiled are consulted for scientific analytical purposes?

(g) Would pure science be served better if we concentrated upon definite clinical problems—instead of spreading our minute record of observations so widely and without coordination of analysis? How can team play and collective thought be made to supplant individualism in this field? Broad-scope chart reviews and analysis.—Paragraph 49d. e.

HOSPITALIZATION IN GENERAL

50. Has the idea of hospitalization been over-developed? Do physicians ship patients into the hospital for personal convenience rather than for a real need on the part of the patient? Should we weigh the matter of relative costs between home and hospital in the border line cases who might stay at home? A58.

51. Superintendents, directors and boards of administration should not attempt to abridge the rights of any physician to enjoy the privileges of

any other institution. Any intimidation or reprisal for failure to support the hospital census or for diverting patients to another institution shall be considered a violation of public policy. (See paragraph 27.) A2, A11.

52. When a physician has enjoyed the privileges of a hospital, for private patients, for one year or more, even though only as a courtesy, he shall be considered to have acquired a right to continue. Such privilege shall thereafter be terminated only by choice of the physician, or for cause, after due hearing, and by consent of a majority opinion of the medical staff at a meeting called for the purpose of consideration of such action.

53. Contribution to “building funds,” and tickets for benefits, fairs, bazaars, card parties, etc., constitute a constant drain upon physicians’ pocket-books. All do not respond to these solicitations, nor do they contribute in proportion to benefits enjoyed. Should we acknowledge our appreciation and establish a definite per cent of hospital case fees, as a routine contribution? This would provide equalization of the burden, proportion it to the benefits, and should be made only on condition of release of physicians and their families from all obligation to support, with money or personal effort, any money raising activity. A2.

The solicitation of funds in any manner by a physician’s wife, or any member of his family from his community-public, in the name of hospital charity, is not good medical economics.

54. Cribbing of gratuities by interns, especially on emergency and ambulance service, raises the question of the wisdom of compensation for their services. Should they be left as “dependents” throughout this period of their development? If rewarded with sufficient compensation to meet the small social and personal needs, would not development of professional pride correct the “habits of their ways”? A2.

55. The practice of medicine by hospitals:

(a) Anaesthesia is commonly administered by an employee, generally a nurse, who carries on under the responsibility of the surgeon, for a stipulated monthly salary paid by the hospital. The patient pays a fee; such fees aggregate a total far in excess of expenses. The physician has the responsibility and the hospital takes the profits. Who is practicing medicine?

(b) A similar problem obtains in the pathologic laboratory, the physical therapy, and roentgen-ray departments. In these a physician is not always in charge; technicians carry on and actually practice medicine under the terms of the present Medical Practice Act.

(c) When “accident or emergency room” first aid services are continued by subsequent daily dressings, for a fee, is the hospital practicing medicine?

56. We recommend:

(a) That principles stated in paragraphs 46, 47, 48, 51, and 52 be pronounced the expressed thought and opinion of organized medicine in this State.

(b) That questions in paragraphs 49, 50, 53, 54, and 55 be continued for consideration of the Committee on Medical Economics, for subsequent report.

(c) That the text of paragraphs 46, 47, 48, 50, 51 and 52 be recommended to the consideration of authorities engaged in the grading and classification of sick-care institutions.

"OUTLET FIELD" FOR MEDICAL KNOWLEDGE

57. The engagement of physicians in other than sick-care employment deserves extended consideration.

58. Is it desirable; is it essential, that the clinical mindedness be preserved? "Full time" employment in a non-clinical activity or in commercialized or industrialized clinical activity deadens the "common touch" and may diminish the value of the well-trained mind in treating the ills of persons?

59. Discrepancies between scope-of-duties and the rate-of-compensation of physicians in non-clinical employment should be studied.

(a) *In Civil Service.* Is there frequent political interference with the attainments of this system?

First Example: A Medical Inspector in a State Department was appointed in 1907 by competitive examination. The appointee was required to have special knowledge regarding special work and to relinquish all teaching and hospital connections. The salary was \$2,500 per annum. The activities required special and research work done successfully, resulting in laboratory facilities where he perfected special new apparatus advancing the work. In 1912 he was made Chief and Director of the Division, salary \$4,000. In 1916 came political change, whereupon despite legislative appropriation and the fact that position and salary were statutory, the Governor cut this position out of the budget, while the incumbent had been called to military service (Mexican Crisis) and then immediately into the World War over-seas, and was unable to defend himself or secure legal action. Returning in 1919 he continued as inspector at \$2,500, increased by legislation to \$3,000 in 1920. In the same year, the position of Director was re-created for a former quarantine officer. In 1921 the former director was made Assistant at a salary of \$3,750. The Assistant Director (former Director) reorganized the Division and directed all activities, and was then required by law to give up all other work. His salary remained same although others doing like work in another Division were increased to \$5,000. In 1929 a new lay

director, without academic or professional training or degrees, and without examination, was made Director, salary \$5,000. Later a farcical examination was held before a man without academic or professional training or degrees, and the lay imposter was reappointed "according to law." This was openly condemned by the State Civil Service Association. In the new classification just effected, 1932, it appears that *no physician* can be promoted to position of Director in this Division of *professional work*. The physician in question, in service for 25 years, an outstanding man nationally in his line, is still a subordinate at \$3,750 per annum. A59.

Second Example: In one township two reputable physicians are employed for different tasks. One receives fifteen cents per capita for making wholesale examinations, a considerable task for insufficient remuneration. The other receives an annual stipend of \$2,500 for a few perfunctory duties occupying very little time. Justice to public and physicians should be determined.

(b) As Interpreters and Statisticians.

(c) As administration officers and executives in General Hospitals, State Hospitals, Municipal Institutions.

(d) As Commissioners and Deputies in Public Health and Hospital systems.

(e) As Insurance Medical Directors, Examiners, and Consultants—full time and part time.

60. All of the positions referred to in paragraph 59 are created, it is assumed, to render genuine 100 per cent service to the public. Is this accomplished? In each of these positions physicians are supposed to have opportunities for service, development, and growth in specialized non-clinical work. Are such opportunities there? The public pay their money which is assigned to these positions by political leaders and institutional boards. The economic questions are:

(a) Is service rendered to the public equal in value to money expended?

(b) Are the positions occupied necessary for the public good, the good of the State, County, or Municipality, or the good of the institutions involved?

(c) Are physicians employed given real opportunities and proper monetary reward?

(d) Do laymen occupy positions requiring medical qualifications?

(e) Do these laymen collect salaries for work done by underpaid medical subordinates?

61. We recommend:

(a) That the succeeding Committee on Medical Economics be instructed by the House of Delegates to continue intensively the study of the questions presented in paragraphs 58, 59 and 60 and report to the next session of the House, with recommendations.

(b) That the House request the Executive Committee and the Trustees to consider this

study in making up the budget for the ensuing year.

COMMERCIALIZED AND INDUSTRIALIZED MEDICINE

62. Congregated. The congregation of subjects for medical practice (wholesale business) flourishes under various guises. Medical aid societies, lodges, insurance schemes, and the syndicates for compensation-law service constitute one general class. The "first aid" stations and their outgrowth in large industrial systems constitute another. So-called "pay clinics" and the quasi-beneficent "health examination service" of the large insurance companies is another.

63. The contracts between members of this Society and any lodge, society, or other schemes which provide for medical service, should be surveyed. A2.

(a) To determine possible violation of Section 31 of the Rules of Professional Conduct, laid down by this Society?

(b) To determine whether the practice of medicine under the contract is bonafide, adequate and competent?

(c) Is the contract a mere subterfuge, a means of making contact for the opportunity of collecting fees on the "extras"?

(d) Exploitation of the patient's confidence?

(e) Contracts for medical service—which, if any, are unethical?

64. Syndicated. Syndicated medical practice is one product of the Compensation Law operation. These institutions cannot survive if the prohibition of solicitation is put into effect. This Committee has caused a bill to be drawn. It follows word by word a section of the law which prohibits the solicitation of law practice cases under the Compensation Law. (This has received the approval of the Executive Committee, Representatives of insurance companies and the Labor Department.) A2, A16, A50.

65. Incorporated Pay Clinics. Dr. Charles Gordon Heyd has inscribed twelve pertinent questions. A3, A8, A36. Among these in substance are:

(a) What is the evidence of need for the clinics?

(b) Is the service adequate and effective?

(c) Is a high standard of diagnosis sustained?

(d) Are the physicians responsible for service rendered?

(e) Are clinic physicians compensated?

(f) Are services free to the indigent and at cost to the poor?

(g) Are they open to all, at a sliding scale of prices?

(h) Do they provide specialized service, when needed?

(i) How does the service compare with the service of the average private office physician?

(j) Is the free treatment of a million patients without danger to society?

(k) Are the fees in truth calculated "at cost"?

(l) Is \$98,000 profit by one hospital dispensary in one year a square deal to the citizens or the profession of medicine?

(m) Research—when does it become paternalistic competition?

(n) Does any regulation or law prohibit the occupation of a "free" bed by a person able to "pay"? What effort is made to enforce such regulations? Have any penalties been enforced?

66. One large company, for many years, has commercialized health examination practice. The economic relation of this activity to the practice of preventive medicine by individual physicians deserves study. A63, A67.

67. Medicine in Industry. The thought has been expressed that medicine in industry may threaten local practice and pave the way for arguments in favor of state medicine and that it may also exploit the physician participating, without what is judged an adequate financial return. A45. The comments have followed two lines of development.

1. That which centers about the adequate logical limitations of what might be called industry's need for medical, surgical and personnel endeavor to be injected into its processes or services.

2. Where such endeavor goes beyond the boundaries of the industry's need.

68. Where work of this kind has developed under reasonably skilled supervision, it is liable to achieve an excellence not obtained under average community medical facilities. Such a service as this is perfectly capable of being adequately controlled by being confined to the actual demands of industry. The objectionable extreme may be the outgrowth of such unusual medical service resulting from well supervised development, and leading naturally to further expansion, with business methods, and unusual physical equipment (such as the average physician and hospital cannot afford). Hence diagnostic and treatment service of a high order may be available, with less and less individual and group limitation and at a surprisingly low cost. It is but natural that the economic appeal here should be strong both to the employer and employee, particularly where inferior local facilities are available. Examples of such trends are seen in the excellent services rendered by such medical departments as those of the Endicott Johnson Company, the Milwaukee Light, Power and Traction Company, Solvay Process, Tennessee Coal and Iron Company and others. This second development of industrial medicine is contrary to the tenets of the profession as over a period of time there will inevitably develop opportunities for impersonal, unmoral and unsocial practices. We believe that the loss of the traditional professional

relationship between patient and physician, which naturally would follow, and the exploitation of the physician to his economic, social and scientific limitation are to be deplored.

69. Industrial Injury. Medicine in industry originated as a natural solution to the injury problem. In the beginning it was confined to first aid facilities alone, administered by lay talent, later followed by the trained nurse and finally by the doctor. Obviously, in certain industries situations exist where, because of location of plants or distribution of forces, medical facilities will be unavailable. First aid training under such conditions partially answers the problem. As an example, the American Telephone and Telegraph Company had until recently in the neighborhood of 75,000 men well trained in the principles and practice of first aid. The steel, power, transportation and mining industries probably double this number. The development of first aid surgical endeavor in many industries has grown out of the lack of adequate local medical talent in the vicinity of such centers, the bulk of the abler and better connected medical people, being in the residential districts with office facilities far removed from factory sections or who by reason of unsatisfactory economic, social or compensation-law experience have refused to accept industrial cases.

70. Industrial Sickness. It has been but a step from the accident first aid situation to that of sickness. Here the objectives may be stated in the beginning to be of the first aid character and to consist of

- (a) Enabling the employees to remain at work.
- (b) Making them more comfortable while at work.
- (c) Diagnosis for protection of themselves as well as other employees.
- (d) Exclusion from work and remanding to family physician.

71. Management Interest. The spread of compensation laws and the paternalistic trend of their administration have seemed to many executives to call for measures of protection. This takes the form of

- (a) Pre-employment physical examination.
- (b) Continued treatment of accident cases arising out of or in the course of employment.
- (c) Examination of both sickness and accident cases before return to duty for purposes of protecting the individual as well as the industry.

72. Diagnostic Service Available to Employees. This phase of medical endeavor has grown out of a well understood inadequate medical service rendered the average industrial employee. Such inadequacies have not been the result of lack of interest by the medical profession, but are due to

- (a) Ignorance on the part of the public as to disease, physicians, hospitals, clinics, etc.
- (b) Real or imaginary lack of economic re-

sources to buy or otherwise obtain necessary diagnostic service.

(c) The widespread publicity of the cults, isms and commercially active health experts and their availability.

(d) The existence of benefit plans or other sickness provisions maintained either by employees, or by industries, or jointly. It has become increasingly evident through experience that there is need for justification of money expenditures based on diagnoses made as adequately as possible. This accrues to the advantage of

1. The agency paying the money.
2. The employee.
3. The doctor caring for the case.

73. The traditional and somewhat provincial attitude of the medical profession as well as economic demands have gradually compelled industry to seek a satisfactory solution not only to its accident problems but to that of sickness. It is apparent that the general answer has not been satisfactorily reached regardless of the complacency shown by certain industries. This committee sees the evolution of medicine in industry and senses an attitude of constructive criticism according to the following outline.

74. Control by Organized Medicine. Medicine in industry has come to stay and its relation to the public and the profession may be properly defined and its ethics established only through adequate recognition. The physician as well as the public must be educated as to social boundaries of medicine as applied to industry. There should be incorporated into the curricula of medical schools subjects dealing with the medical, surgical and social aspects of the population with respect to industry, including among others, the principles of first aid, traumatic surgery and industrial disease. This Committee believes that the services available in industry for the furthering of the medical arts can become of real value to the general practitioner both scientifically as well as economically where development of medicine in industry is confined within the following limits:

- (a) First aid problem in sickness and accident.
- (b) Pre-employment, post-illness and periodic health examination.
- (c) The diagnostic services in selected cases where economics and professional limitation make need.
- (d) Continued treatment of accident cases under certain conditions.
- (e) Medical advice and counsel.

75. We recommend that paragraphs 68, 69 and 74 be pronounced the expressed thought and opinion of organized medicine in this State.

76. It is rumored that "medical clubs" exist, the members of which pass patients around the circle, "as long as the funds hold out." If true, it is an outrageous abuse of the lay confidence in

the profession. If not true, it is a slander upon our profession. The truth should be established by thorough investigations. A17, A24.

77. The Cooperstown experiment in community medicine has been surveyed, recently. A17.

78. "It is very evident that the residents of Cooperstown appreciate that they are getting more than their money's worth in the 'Guild' and that to continue such a plan the Hospital will have to be subsidized." (\$175,000 last year.)

We also conclude that such a plan as practiced by the Guild of the Imogene Bassett Hospital is not economically sound, and will be of no value in solving the problems of the 'cost' of sickness." A17.

This experiment has tended to train respectable solvent members of a community in semi-pauperism.

79. Physicians who advertise in "the foreign language" newspapers are doing so in defiance of violation to Section 31 of the Principles of Professional Conduct, adopted by this House of Delegates, June 1, 1931. A70.

Any physician guilty of such practice, should be ineligible for membership in this Society for one year from the time of such act; and any physician member who continues such practice, after due warning, should be suspended for at least one year.

80. The prescribing and treating of sick and injured by drug clerks and pharmacists is in violation of the Medical Practice Act. Prosecution is the only remedy. Your Committee requests information of specific instances which have resulted in disaster or harm to the patient.

81. We recommend:

(a) That a survey be made of the various forms of contract under which individual medical service is rendered, as suggestively outlined in paragraphs 62, 63, 64, and 66 by the Committee on Medical Economics with the aid of the Counsel of this Society.

(b) That a survey be made of the free and pay clinics along the lines indicated in paragraph 65, by the Committee on Medical Economics.

(c) That the draft of the law prohibiting the solicitation of medical work under the Compensation Law be introduced at the next meeting of the State Legislature,—paragraph 64,—by the Committee on Medical Legislation. A16, A50.

(d) That investigation be made to determine the activities of clubs, if any, of this type, by the Committee on Medical Economics.—Paragraph 76.

(e) That observation of this experiment be continued by the Committee on Medical Economics; with instruction to promote due publicity of its demise, if and when.—Paragraphs 77 and 78.

(f) That this, paragraph 79, interpretation of the Rules of Professional Conduct be approved, and that the County Societies be given due notice

that offenders under this Rule will be liable to the regulations of Chapter 1, Article 2 of the By-Laws of this Society. A2.

(g) That the professional status of physicians who contract to work for firms, clinics and institutions, who advertise to the public for patronage of the service which they, the physicians, render, be a subject of study by the Committee on Medical Economics.—Paragraphs 62 and 63. A2, A47.

(h) That the Committee on Medical Economics be instructed to report any violation of the Medical Practice Act (paragraph 80) to the Department of Education for investigation and action.

WORKMEN'S COMPENSATION LAW

82. The agreement between Carriers and State Society has fulfilled hopes in its operation. Arbitration meetings and *preventive* settlements, by our sub-committee in charge, have been notably successful in disposing of contentions and in promoting cordial understandings between Insurance Carriers and our membership. A2, A18, A64, A86.

A new arbitration center has been established in Buffalo. Another is promised for Onondaga County, where the agreement was ratified at the December meeting. Oneida County adopted the agreement at the January meeting. Delays may cause temporary misgivings and disappointments, but when the National Bureau, representing the Carriers, secures adequate machinery for various local operations of the agreement, all expectations will be exceeded. A19.

83. With elementary data in hand, the agreement and the machinery for arbitration are not difficult to comprehend or manage. This Committee has been represented in various parts of the State where interest has demanded conference. More meetings and conferences are desirable, either at regular or special meetings of County Societies, or District Branches.

84. Compensation Clinics. Many of these offer unfair competition to regular physicians; give inadequate service to the patient resulting in delayed or incomplete recovery, or both; use questionable methods in obtaining authorizations, advertise by placards, cards and letters; employ cheap, poor, and inefficient help; all of which increases the cost of care to the insurance carriers. They afford the most disturbing factor in the relationship of our members and the insurance carriers. Advertising and solicitation is essential to their success. (See paragraphs 64 and 81c.) A20.

85. Paper work is a *sine qua non* to the smooth operation and administration of the Compensation Law, because the Labor Department *must have complete C4 forms upon which to base all action* in any case. "Compensation Clinics are

tolerated by the Labor Department and Insurance Companies largely because they are prompt in paper work. Occasional workers under the Compensation Law often fail to recognize or appreciate the importance of it, and too commonly delay forwarding the C4 form."

86. The use of the word "agreement" misleads to thoughts of a contract. There will be less confusion of thought if we substitute "understanding" where we have been in the habit of referring to the "agreement." It was a gentlemen's *understanding*. A2

87. Governor Roosevelt's Committee to Review Medical and Hospital Problems, in connection with Workmen's Compensation Insurance, appointed March 2, 1931 has offered majority and minority reports. A20, A21

88. Hospital Problem—recommendations to the Governor include

(a) Provision for charges for bed commensurate with reasonable cost service without regard to established rates in wards or elsewhere

(b) Elimination of necessity for authorization for hospitals

(c) Lien Law for hospitals to enforce charges in "third party actions"

(d) Preventing of delay of payments or notification of contest of charges by Carriers—allowing Carriers two weeks on bills outstanding thirty days

89. Medical Problem—recommendations to the Governor include

(a) All industrial diseases to come within scope of Workmen's Compensation Law. (Now only 27 are compensable)

(b) Exclusion of Carrier's physician from examinations by State Labor Department physicians

(c) Disapproval of the "lifting" of cases with penalties

(d) Elimination of insurance company clinics

(e) Exclusion of case records furnished by insurance company physicians

(f) Rating or licensing of physicians of same qualification or capacities for work under the Compensation Law, by Board of Regents

(g) Increased professional personnel in the Labor Department

(h) Increase of clerical staff

(i) Definition of "total disability" to mean—a workman unable to return to occupation in which he was employed when injured

(j) Creation of Medical Supreme Court of Physicians, for cases difficult for decision

(k) Establishment of Clinics under the direction of the State

90 We recommend

(a) Substitution of the use of "understanding" for "agreement" to avoid confusion (Not a contract) (Paragraph 86)

(b) Renewed approval of the *understanding* with the Insurance Carriers because of the ex-

perience of the past year (Paragraph 82) A18

(c) Approval of suggestion of County Societies and District Branches, that more programs include discussions of the "understanding" (Paragraph 83)

(d) Amendment of Workmen's Compensation Law making it a misdemeanor for any person, firm or corporation to solicit the professional treatment or care of an injured employee or make it a business to solicit the employment of or for a physician in connection with a clinic for treatment or care. (This has been approved by the Executive Committee at its February meeting) (Par 64, 81c, and 84) A18, A22, A33

(e) That the House of Delegates urge the members of the State Society to be prompt and complete in furnishing C4 forms and other paper work demanded by the Workmen's Compensation Law (Paragraph 85)

(f) Approval of the report of the Governor's Commission in its recommendations regarding "hospital problems" (Paragraphs 87 and 88)

(g) Disapproval of the exclusion of the insurance carrier physician from examination by Labor Department Physician, since this is unjust to the carrier, limits desirable consultation, and provides for prolonged contests and delays in benefits to the injured (Paragraph 89b)

(h) Disapproval of the "rating and licensing" of physicians for compensation work by Regents or any other authority (The State of New York has already licensed and registered its physicians) (Paragraph 89f)

(i) Disapproval of the extension of the provision of the Workmen's Compensation Law in occupational disease until further study, in which this State Society shall be adequately represented with voice and vote in the Committee deliberations (Paragraph 89a)

(j) Approval of the disapproval of "lifting" cases with provision for penalties (Paragraph 89c)

(k) Approval of the elimination of the insurance company clinics (Paragraph 89d)

(l) Disapproval of the exclusion of the case records from insurance company physician (Paragraph 89e)

(m) Approval of a Supreme Court to review, provided the suggested panel of 75 physicians be named by or is subject to the approval of the Medical Society of New York State (Paragraph 89j)

(n) Vigorous, unanimous disapproval of the suggestion for the establishment of clinics under the direction of the State. Our reasons are given in paragraph 156—Paragraph 89k

PUBLIC HEALTH AND INDIVIDUALIZED MEDICAL SERVICE BY PUBLIC AGENCIES

91. Public Health has spilled over from sanitation and the control of communicable disease by

108. Banking applied to loans for sick care must be humane, must preserve a friendly relationship between the physician and his patient, must be done with a bit of the heart and not with two cold, unsympathetic "glass eyes," a new idea in banking, in which life and deep seated appreciation, the essence of human nature, furnish and govern the theme rather than acquisitive merchandising and gainful bargaining.

109. This type of banking can be regulated by the volunteer acceptance of our supervision. It is practicable, possible and comparatively easy of accomplishment. The Sage Model Loan Law, as worked out in Massachusetts, may well be taken as a model from which to draft suitable regulations. A22, A32.

110. Both banking and bill collecting should be safeguarded by some regulations and by "bonded guarantees" to insure the security of money collected for the physicians, and to guarantee performance of contracts. A22, A90.

111. A survey of present financing possibilities presents:

(a) The conventional "small loan" companies operating under the "bank laws" of the State. They require two acceptable co-makers, and have no concern with preservation of friendliness, when a note is past due. A28.

(b) A second type of firm is the "broker" or agent firm, who market the patient's note to a small loan bank or to the commercial paper institutions. A29.

(c) A third type is one which advances to physicians part of the face of the note on the date of acceptance, and follows through on collection of deferred installments, with final payment, less commission, when the note is redeemed. A30.

All of these firms propose a "financial rating" service of one sort or another which will tend, if used, to definitely curb the dead-beat.

112. In our report to the Executive Committee at its November meeting we made specific recommendations relative to these types of financing sickness. A22.

113. In a report of a sub-committee of the Executive Committee, appointed to consider our recommendations, the recommendations were rejected on the ground that "it is outside the province of the State Society to endorse any company." A33.

114. Your Committee on Medical Economics feels that there should be some ready means or method for the citizen, who desires to remain in the self-respecting and self-supporting class, to provide himself and his family with medical care if the emergency overtake him when he has no ready cash. We conceive that, in this way, in a measure, we may combat one great argument for socialized sick-care. The importance of it justifies further consideration. A2, A22.

115. We recommend the reconsideration of the subject.—Paragraphs 112, 113, 114, 116.

116. The supervisory regulation (without financial responsibility or liability), proposed by the Committee on Medical Economics, sets up the following conditions to be met by any concern dealing with bill collection for physicians or the financing of the sick, who desire to voluntarily accept such advisory supervision. A22, A32, A33.

"1. Submit to the Economics Committee a brief history of the firm and brief statement with names of all principle owners (10 per cent or more).

"2. A statement of previous business connections of each director or owner and to advise us immediately of all subsequent changes of ownership.

"3. Names of banks where the firm does business, financial references, and other business associates.

"4. Name of bonding company, amount and date of bond which covers each employee who handles money.

"5. Statement of what there is to guarantee stability of the firm and to guarantee performance of contract (a bond or its equivalent).

"6. Supply the Committee on Medical Economics with copies of all printed forms and advertising matter as or when issued and agree to immediately delete or recall anything which is not approved by the Committee.

"7. Contract between doctors and firm must be standard and submitted for approval of the Committee. No change shall be made without the approval of the Committee.

"8. Present financial statements showing

"a. Resources and liabilities on date of application for recognition.

"b. Total amount of new account items of previous year. Total of money paid to doctors on that amount. Total which is still held collectible. Total abandoned as non-collectible.

"c. File with this Committee monthly, quarterly, or yearly statements, as required, showing total of new accounts received; total of payments to doctors; total remaining in process of collection; total of abandoned accounts; number of cases carried to court action; and such other items as may be specified.

"9. Agree to confidential review of books and records of the firm by the Committee or a representative thereof. A certified, public accountant may be employed by the Committee at the company's expense.

"10. Agree to accept judgment of all issues and be bound by the decision of a Committee, the latter to be of or appointed by the Economics Committee.

"11. They shall provide credit information service to all physicians registered by them for service.

"12 That accepted firms be permitted to use a standard legend or form in advertising display, the legend to be determined by this Committee

"13 These regulations to be subject to revision, addition and extension to conform to the provisions of the Massachusetts Small Loan Law"

117. We recommend

That the Committee on Medical Economics be instructed to proceed with the business of establishing the regulation and supervision of firms engaged in collection of physicians' bills, and of financing sickness through the various plans of deferred payments, in accordance with the general plan outlined in paragraphs 105-116, and in the Appendix A22, A28, A29, A30, A33

And provided that nothing shall be done to involve this Society, in any way, in any financial responsibility (Paragraph 116)

118. The "National Health Plan Inc" is a scheme built on the "Christmas Club Account" idea. Perhaps the philosophy of putting away in a savings account for the unexpected illness might be fostered and made to reach many. Another possibility is that when the account has accumulated to its full maturity the income from it could be used for the annual health examination, which would foster the practice of preventive medicine A34

119. We recommend

That the Committee on Medical Economics investigate this plan and report to the Council with recommendations (Paragraph 118)

120. In Brattleboro, Vermont a community insurance plan, which provides hospital and medical service, has been in operation for a sufficient time to show its worth and any possible flaws

121. We recommend

That this Plan be surveyed by personal observation by at least one member of the Committee on Medical Economics, and that the Committee report to this House at the next annual meeting (Paragraph 120)

122. *Split Fees* The present general prohibition of any division of fees operates to the entire satisfaction of the Specialists and Surgeons but operates with considerable injustice to the other members of the profession A35 A76 A91, A92

Diagnosis and the problems of 'after care' frequently require a skill and experience quite equal in professional evaluation with that of the surgical technician

In the instance of the family where the affluence permits adequate and full compensation there is no problem

In that vast majority of families where there is a limit of ability to compensate professional service if there has been *bonafide participating service* and responsibility, then with the knowledge of the patient the lump sum which is possible should be divided between the participants according to their mutual satisfaction

123. When the doctor merely refers a patient for consultation or care, and *does not participate* in the service, any division of the fee is reprehensible and both the giver and the receiver of the "split" should be suspended or barred from membership in organized medicine, for violation of Section 32 of the Rules of Professional Conduct adopted by this House, June 1, 1931

124. Some hospitals undertake to regulate the physician's fee in accordance with the accommodations occupied by the patient

Some hospitals are advertising to the public, a "lump sum" service to include both hospitalization and professional care A82

125. We recommend

(a) That Paragraph 122 be pronounced the expressed thought and opinion of organized medicine in this state

(b) That Paragraph 123 be pronounced the expressed thought and opinion of organized medicine in this state

(c) That component societies be advised and urged to institute such disciplinary regulation as called for in Paragraph 123, 125(a), 125(b) 125(e)

(d) That the problems presented in Paragraph 124 be studied by the Committee on Medical Economics with instructions to refer any question of "institutional practice of medicine" to the Counsel

(e) That the taking or receiving of rebates from truss makers instrument dealers, drug stores pathologic and x-ray laboratories, from payments by a referred patient shall be considered a "split fee" (Paragraph 123), and that the participant shall be subject to the same penalties

SOCIALISM, PATERNALISM, AND MEDICINE

126 One feature stands out above all else, in every casual or extended survey of the "Foundations" and of so called "Public Health" and 'Public Health Nursing' carried under the direct money power or direct influence of these agencies A6 A7

It is the universally alleged need of the American people for education and instruction on how to live, the need for the particular brand of intellectual culture conceived by the "Foundations" A7

127. They allege our need of this ministering service even before we are conceived, in fact many souls are said to be unborn because of this new "instruction," and we never outgrow that need—those of us who get by the first lesson A2

128. What does the Department of Education of the State of New York have to say in answer to this implied indictment? After the expenditure of millions of tax money and the employment of thousands of "teachers" over the past half century can it be true that any considerable part of our citizenship lacks reasonable degree of knowledge in the simple ken of living? Page the spokesman of this Department!

108. Banking applied to loans for sick care must be humane, must preserve a friendly relationship between the physician and his patient, must be done with a bit of the heart and not with two cold, unsympathetic "glass eyes," a new idea in banking, in which life and deep seated appreciation, the essence of human nature, furnish and govern the theme rather than acquisitive merchandising and gainful bargaining.

109. This type of banking can be regulated by the volunteer acceptance of our supervision. It is practicable, possible and comparatively easy of accomplishment. The Sage Model Loan Law, as worked out in Massachusetts, may well be taken as a model from which to draft suitable regulations. A22, A32.

110. Both banking and bill collecting should be safeguarded by some regulations and by "bonded guarantees" to insure the security of money collected for the physicians, and to guarantee performance of contracts. A22, A90.

111. A survey of present financing possibilities presents:

(a) The conventional "small loan" companies operating under the "bank laws" of the State. They require two acceptable co-makers, and have no concern with preservation of friendliness, when a note is past due. A28.

(b) A second type of firm is the "broker" or agent firm, who market the patient's note to a small loan bank or to the commercial paper institutions. A29.

(c) A third type is one which advances to physicians part of the face of the note on the date of acceptance, and follows through on collection of deferred installments, with final payment, less commission, when the note is redeemed. A30.

All of these firms propose a "financial rating" service of one sort or another which will tend, if used, to definitely curb the dead-beat.

112. In our report to the Executive Committee at its November meeting we made specific recommendations relative to these types of financing sickness. A22.

113. In a report of a sub-committee of the Executive Committee, appointed to consider our recommendations, the recommendations were rejected on the ground that "it is outside the province of the State Society to endorse any company." A33.

114. Your Committee on Medical Economics feels that there should be some ready means or method for the citizen, who desires to remain in the self-respecting and self-supporting class, to provide himself and his family with medical care if the emergency overtake him when he has no ready cash. We conceive that, in this way, in a measure, we may combat one great argument for socialized sick-care. The importance of it justifies further consideration. A2, A22.

115. We recommend the reconsideration of the subject.—Paragraphs 112, 113, 114, 116.

116. The supervisory regulation (without financial responsibility or liability), proposed by the Committee on Medical Economics, sets up the following conditions to be met by any concern dealing with bill collection for physicians or the financing of the sick, who desire to voluntarily accept such advisory supervision. A22, A32, A33.

"1. Submit to the Economics Committee a brief history of the firm and brief statement with names of all principle owners (10 per cent or more).

"2. A statement of previous business connections of each director or owner and to advise us immediately of all subsequent changes of ownership.

"3. Names of banks where the firm does business, financial references, and other business associates.

"4. Name of bonding company, amount and date of bond which covers each employee who handles money.

"5. Statement of what there is to guarantee stability of the firm and to guarantee performance of contract (a bond or its equivalent).

"6. Supply the Committee on Medical Economics with copies of all printed forms and advertising matter as or when issued and agree to immediately delete or recall anything which is not approved by the Committee.

"7. Contract between doctors and firm must be standard and submitted for approval of the Committee. No change shall be made without the approval of the Committee.

"8. Present financial statements showing

"a. Resources and liabilities on date of application for recognition.

"b. Total amount of new account items of previous year. Total of money paid to doctors on that amount. Total which is still held collectible. Total abandoned as non-collectible.

"c. File with this Committee monthly, quarterly, or yearly statements, as required, showing total of new accounts received; total of payments to doctors; total remaining in process of collection; total of abandoned accounts; number of cases carried to court action; and such other items as may be specified.

"9. Agree to confidential review of books and records of the firm by the Committee or a representative thereof. A certified, public accountant may be employed by the Committee at the company's expense.

"10. Agree to accept judgment of all issues and be bound by the decision of a Committee, the latter to be of or appointed by the Economics Committee.

"11. They shall provide credit information service to all physicians registered by them for service.

"12. That accepted firms be permitted to use a standard legend or form in advertising display, the legend to be determined by this Committee.

"13. These regulations to be subject to revision, addition and extension to conform to the provisions of the Massachusetts Small Loan Law."

117. We recommend:

That the Committee on Medical Economics be instructed to proceed with the business of establishing the regulation and supervision of firms engaged in collection of physicians' bills, and of financing sickness through the various plans of deferred payments; in accordance with the general plan outlined in paragraphs 105-116, and in the Appendix. A22, A28, A29, A30, A33.

And provided that nothing shall be done to involve this Society, in any way, in any financial responsibility. (Paragraph 116.)

118. The "National Health Plan, Inc." is a scheme built on the "Christmas Club Account" idea. Perhaps the philosophy of putting away in a savings account for the unexpected illness might be fostered and made to reach many. Another possibility is that when the account has accumulated to its full maturity the income from it could be used for the annual health examination, which would foster the practice of preventive medicine. A34.

119. We recommend:

That the Committee on Medical Economics investigate this plan and report to the Council with recommendations. (Paragraph 118.)

120. In Brattleboro, Vermont, a community insurance plan, which provides hospital and medical service, has been in operation for a sufficient time to show its worth and any possible flaws.

121. We recommend:

That this Plan be surveyed by personal observation by at least one member of the Committee on Medical Economics; and that the Committee report to this House at the next annual meeting. (Paragraph 120.)

122. *Split Fees.* The present general prohibition of any division of fees operates to the entire satisfaction of the Specialists and Surgeons, but operates with considerable injustice to the other members of the profession. A35, A76, A91, A92.

Diagnosis and the problems of "after care" frequently require a skill and experience quite equal in professional evaluation with that of the surgical technician.

In the instance of the family where the affluence permits adequate and full compensation there is no problem.

In that vast majority of families, where there is a limit of ability to compensate professional service, if there has been *bonafide participating service* and responsibility, then, with the knowledge of the patient, the lump sum which is possible should be divided between the participants, according to their mutual satisfaction.

123. When the doctor merely refers a patient for consultation or care, and *does not participate* in the service, any division of the fee is reprehensible and both the giver and the receiver of the "split" should be suspended or barred from membership in organized medicine, for violation of Section 32 of the Rules of Professional Conduct, adopted by this House, June 1, 1931.

124. Some hospitals undertake to regulate the physician's fee in accordance with the accommodations occupied by the patient.

Some hospitals are advertising to the public, a "lump sum" service to include both hospitalization and professional care. A82.

125. We recommend:

(a) That Paragraph 122 be pronounced the expressed thought and opinion of organized medicine in this state.

(b) That Paragraph 123 be pronounced the expressed thought and opinion of organized medicine in this state.

(c) That component societies be advised and urged to institute such disciplinary regulation, as called for in Paragraph 123, 125(a), 125(b), 125(e).

(d) That the problems presented in Paragraph 124 be studied by the Committee on Medical Economics with instructions to refer any question of "institutional practice of medicine" to the Counsel.

(e) That the taking or receiving of rebates from truss makers, instrument dealers, drug stores, pathologic and x-ray laboratories, from payments by a referred patient, shall be considered a "split fee" (Paragraph 123), and that the participant shall be subject to the same penalties.

SOCIALISM, PATERNALISM, AND MEDICINE

126. One feature stands out above all else, in every casual or extended survey of the "Foundations" and of so-called "Public Health" and "Public Health Nursing" carried under the direct money-power or direct influence of these agencies. A6, A7.

It is the universally alleged need of the American people for education and instruction on how to live; the need for the particular brand of intellectual culture conceived by the "Foundations." A7.

127. They allege our need of this ministering service even before we are conceived, in fact many souls are said to be unborn because of this new "instruction," and we never outgrow that need—those of us who get by the first lesson. A2.

128. What does the Department of Education of the State of New York have to say in answer to this implied indictment? After the expenditure of millions of tax money and the employment of thousands of "teachers" over the past half century, can it be true that any considerable part of our citizenship lacks reasonable degree of knowledge in the simple ken of living? Page the spokesman of this Department!

129. On more than one college campus the word has gone around that there are "great opportunities in Public Health," and each graduation sees a new swarm scatter for the harvest. Schools for the training of "welfare workers" have sprung up and are sending out their recruits to meet this American need. What need? Whose need? A24, A36.

130. The donors of these vast sums of money have been actuated, undoubtedly, by the most beneficent of motives. Many of them have had the experience of real hardships. An innate nobility of spirit would save others or soften the blows. That they have not been possessed of superhuman wisdom; that the perfect workable way to their purpose is not charted, is not a cause for condemning them. A37.

131. Neither can we blame the army of "meal ticket hunters," who have seized opportunity by the pocket-book. Our non-medical philosophical "docs" have tried to keep faith with the endowment's purpose. A2.

132. But "health" and "sickness" are not so much a matter of philosophy as they are a matter of medical science. And no program of "public health" can possibly succeed without a "clinically-minded" pilot at the helm, and without the cooperation of the whole clinical profession of medicine. A2, A38.

133. There is a definite trend of the Foundations to turn to organized medicine for leadership and for cooperation with the whole of the profession. If organized medicine will forget "the Greeks bearing gifts," and meet the new turn half way, the foolish noble experiments in socialized medical nonsense will cease. A25, A37, A38.

134. The intellectual carpet-baggers, who have threatened American medicine with paternalism, are centering their interest in the "white collar class." Why? The poor cannot pay, the rich will not tolerate their ballyhoo, and their only hope of finding a friendly pay-roll is in some scheme which will catch the fancy of the average American citizen who is able and always pays for what he wants. Behind window dressings, included in which are some distinguished members of our own profession, the plans take shape. A2, A39.

135. A full report of the National Committee on the Survey of the Cost of Medical Care has not been issued. From matter already in hand, it seems that physicians have no reason to fear any radicalism. On the other hand, many platitudes will be sprinkled along the discourse, to which speakers, on occasion, may refer. But undoubtedly, this report will be loaded with propaganda material for use in the campaign for larger appropriations from the public treasury, for a "larger and better" army of health workers, who rarely get into the sick room, and who have never yet demonstrated any real value in reducing the incidence of morbidity or mortality. A12, A40.

136. "Cheap medical care" is the bait. Barnum said, "a sucker is born every minute." Are they in the majority today? Europe has cheap medicine, and an ultra-scientific profession, whose members seem satisfied to live just above the pauper class, and who discuss an autopsy with greater fervor than they do the "recovery" of an interesting case. A24.

137. Life is so precious; death so permanent. America, where more is spent for tobacco and cosmetics than for physicians, is not interested, at heart, in cheap medicine. What the man in the street wants is a better brand of medicine, and when he finds it he will be ready and glad to pay a right price for it. A2.

138. Wake up, don't let the carpet-baggers teach our neighbors to be humbugged into liking the thing which you and I know will be found to be "rotten" when he gets it. "Buying cheap things to save money is like stopping your watch to save time."

139. The State cannot give back more than it takes from the people. The interposition of social workers, welfare workers, public health brigade of nurses, and a lot of political job holders in the administrative machinery cannot have but one consequence: greater cost of sick care, and a poorer quality inevitable to employment of "cheap professionals". Increased taxation!

140. We recommend:

(a) That the Department of Education of the State of New York be requested to survey and determine if there is such an ignorance among our citizenry as common reports, in certain prints, would indicate.—Paragraphs 126, 127, 128. A6, A7, A13, A51.

(b) That it is the sense of the House of Delegates of this State Society that organized medicine is ready to cooperate with and counsel any Foundation, on condition that the pre-eminence of clinical medicine in the health field is acknowledged; and that any program of activity in any locality of this State will be undertaken or continued, only when approved by the local County unit of organized medicine. That upon these terms we hold out the hand of friendship to any who will meet us on-the-square.—Paragraphs 132, 136, 137, 139.

(c) That it be the expressed thought and opinion of the House of Delegates that organized medicine, with the economic support from the Foundations, can put over a real health program in which everyone can find satisfaction and gratification. (Paragraph 132.)

(d) That it is the opinion of organized medicine that a socialized and paternalized sick-care, presided-over by or through the tin-box type of politician, even though cheap, is no more to be desired than a state religion. (Paragraph 139.)

PHYSICIANS AND COURTS

141. We have familiarized ourselves with the

crystallized legal mind on the matters of subpoenas, witness fees, etc. We know that it will be necessary to cause fundamental changes in the "rules of evidence" and in the regulation of "procedure," if physicians are to be given intelligent and just consideration in their relation to the "trial court" A33

142. The life of a physician is primarily one of service to the sick and injured. It is painful, that he may sustain himself in that occupation—gun is secondary to a true professional instinct.

The Law, in the exhibition of its supreme majesty, holds, "at the very root of our judicial system is the power to compel attendance of witnesses by subpoena," quoting the words of Legal Counsel

The negligence claim is not too petty or poorly alleged but that any attorney may exercise the authority of the Court "to command" the attendance of a physician, as commonly occurs even to the neglect of his paramount duties. The claim of the plaintiff and his contingent fee attorney are made a first demand over the needs of the sick. Is this Justice? Is it good common sense?

143. This and other complaints were cited to the Executive Committee with the recommendations for relief. We were perfectly familiar with the Law on the various parts. We desired to voice our complaints and initiate action toward amendments of the Civil Practice Act A74

These recommendations were disapproved on the advice of Counsel A33c

144. There are evidences on every hand that the old order of things will undergo considerable revision

145. Judge Frederick E. Crane of the State Court of Appeals, addressing the New York City Bar Association, is quoted in the public news as saying "The people have grown impatient with the delays, the technicalities and the refinements of law which impede rather than further the ends of justice—Our system is being challenged" A41

146. Judge Crane further suggested extension of the Compulsory Arbitration Law to automobile accident cases. "What a speedy disposition there would be of all these automobile accident cases when the court would appoint arbitrators without limit—a lawyer, and a doctor and a layman—who would dispose of the case as satisfactorily, yes, even more satisfactorily than most of the courts and juries" A41

147. Presiding Justice Edward Lazansky of the Appellate Division, has announced the appointment of a permanent committee of five judges and five lawyers, "to receive suggestions helpful to the betterment of general and calendar practice and procedure and in the general administration of the law" A41

148. In consideration of information contained

in paragraphs 145, 146 and 147 of this report, we consider the time opportune to initiate action as previously recommended A68

We recommend the reconsideration of the subject and we amend our bill of complaints A68

149. We recommend

(a) That this House of Delegates approve of the principle of Compulsory Arbitration of automobile accident case claims (Paragraph 146)

(b) That we approve the inclusion of a doctor on such arbitration board (Paragraph 146)

(c) That the Secretary of this Society transmit the expressions of our approval (Paragraph 149a-b) to Justice Frederick E. Crane

(d) That the House of Delegates request Justice Edward Lazansky of Appellate Division to include in the "permanent committee" to receive suggestions helpful to the betterment of the general administration of the laws, four representatives from the Society, the Counsel of this Society, and the Chairmen of the three standing Committees of Public Relations, of Public Health and Medical Education, and of Medical Economics (Paragraph 147)

(e) That the President of this Society be instructed to appoint representatives to appear before the Committee appointed by Judge Lazansky (Paragraph 147), and that this Committee be instructed to take up the complaints enumerated in the Appendix A41

(f) That the recommendations presented by the Committee on Medical Economics to the Executive Committee at its November meeting, be approved by this House, as here quoted A22, A33

"(a) Concerning relief of physicians from ordinary routine subpoena, we recommend that in this State physicians should be subject to a mandatory call issued only by a judge of a court"

"(b) Physician witnesses are in fact expert and in no sense ordinary witnesses of fact only. They should be recognized as expert"

"(c) We recommend that for such expert witness there should be standard provision for compensation made by Law"

(d) We recommend that there be an effort so to amend the laws as to make the physician's fee a lien upon the recovered sum in all negligence cases" A83

"(e) The amendment regarding the lien on verdict recovery or settlement, to include fee for appearance in court"

PRACTICE OF MEDICINE BY CORPORATIONS

150. Practice of Medicine by Corporations which is illegal in the State of New York seems to merit the attention of the Society. Groups of lay people incorporate and conduct clinics, bureaus and services employing physicians (licensed and unlicensed) to do their work. Is this

the Practice of Medicine by Corporations? Lay people provide for corporations which conduct health examinations and afford diagnoses for apparently healthy persons for a fee. Hospitals make contractual arrangements with employers or insurance companies to treat compensation cases. A few insurance companies have established clinics for treatment of compensation cases. A2, A79, A94.

151. Such practice of medicine is invariably for the purpose of diverting work which is inferentially assigned by the Medical Practice Act to practicing physicians. The main object of such diversion is to make money for lay persons or organizations. Employed physicians are in the main, poorly compensated. The public, as a rule, is inadequately served. A2.

152. This Committee in its February report to the Executive Committee presented an extended consideration of this matter. (Practice of Medicine by Corporations.)

153. In this field also we include organized group practice, sanatoria, etc., which do not commercialize medical service. A47, A79.

154. We recommend:

(a) That the Medical Society of the State of New York, through its Counsel, institute an action at law against some corporation practicing medicine, in order to establish respect for the laws of the State by all such corporations and to secure authoritative decision which shall be sufficient to stop injustice to the people of the state and their physicians.—Paragraphs 150, 151. A2.

(b) We recommend that the Practice of Medicine by Corporations be continued on the program for study by the Committee on Medical Economics. (Paragraphs 150 and 151.)

ORGANIZED MEDICINE

155. An elementary reason for the *economic* position of medicine in world opinion is the ridiculously small financial contribution of physicians to organization work. Compare with contributions of Labor Union, other professional associations, and even irregular cults. A54.

The tremendous difference in principle is that the other groups are organized solely in selfish interests to force higher wages, less hours of work and less quantity of work. We desire organized control of Medicine and public health primarily because it is good for the people at large. Secondly and subconsciously we know that for adequate satisfactory work under such conditions a reasonable reward will be ours. A54.

156. Political and other lay control of medicine has always meant:

(a) Deficient service to the people with lowered morale and unlimited malingering. A69.

(b) Enslavement of physician.

(c) Decline in science and art of Medicine.

(d) Increased cost to industry or taxpayer or both.

(e) Lessened reward for physicians.

The United States is not Europe. We must show Europe the way back to medical sanity. Organization funds collected primarily for the public good cannot justly be condemned.

The work needed cannot be done without funds.

157. Your Committee is of the opinion that the funds for organized medicine in its various branches must be quickly forthcoming and zealously safeguarded. With only one year of study we are not competent to recommend a specific amount or its distributive assignments among County, State, and National Organizations. Our study thus far, combined with opinions secured from sympathetic leaders in the business world, leads us to suggest that the sufficient necessary figure is between *one hundred and two hundred and fifty dollars* per capita per annum throughout the country.

158. We recommend that your next Committee on Medical Economics be instructed to confer with the Bureau of Medical Economics of the American Medical Association and with the Committees on Medical Economics of neighboring states with the aim of securing concerted action as quickly as may be, regarding increased funds for organization work. (Paragraphs 155, 156.)

PROGRAM TO BRING LOCAL COUNTY ECONOMICS COMMITTEES INTO ACTIVE LIFE

159. Contemplation of this matter, coupled with a single experience of effort at cooperation with another committee of this Society, prompts a wider consideration of organized-medicine activity. A43, A65.

160. "The physician, as an individual, needs to give more thought to the civic responsibility facing him as a citizen. Through the Committee on Medical Economics, the Committee on Public Health, the Committee on Illegal Practice, this phase of our communal existence is receiving considerable attention. Results are being obtained. They are difficult of measurement." The 12,000 physicians of this organization should have an administrative machinery. A52, A93.

(a) To find facts and classify them for analysis and ready reference.

(b) To devise and operate the orientation of organized medicine in the application of its "collective thought" whenever and wherever the civic and social welfare of the people of this State demands.

(c) To coordinate the work of all of its committees and of its component County units.

(d) To constitute the intelligence of our profession into a real and full-powered force throughout the realm of this State.

(e) To exercise a constant and inclusive

watch, over the whole field of events. A machinery which will make organized medicine fully alive to its sociological and civic environments.

161. We recommend

(a) That a committee be appointed to study and make a preliminary report to the Council not later than November 10, 1932, on organization and administrative machinery for fact finding, policy-planning, and coordination, with a plan and program to make this organization a unit of power and to give its collective thought a real value (Paragraphs 159, 160)

(b) That the Budget Committee and the Trustees be requested to consider the financial needs of this special committee, and include it in the budget (Paragraph 161(a))

PERORATION

162. Basic Principles Economics is not acquisitiveness. Medical Economics involves the application of the broad policy of maximum benefits to our neighbors—the public who surround us and need us—and the re creation and maintenance of their confidence and good will. High class service should be provided. The public must be happily impressed with the service. It must not only be but also be recognized as adequate, complete, humanly kind, earnest, interested and obtainable at a cost reasonable and negotiable by

persons served. The great public—our neighbors—must be given *what they need*, and be intellectually led to like it by men whose consideration of self gain or self aggrandizement is never obvious or obtrusive. However, every civilized person knows that such service costs training, time, equipment, and money, and must be adequately rewarded.

Wide differences in rewards demonstrate inadequate application of the principles of economics.

163. We recommend the adoption of Paragraph 162 as a part of the *Credo* of The Medical Society of the State of New York.

Respectfully submitted and signed by the Standing Committee and the Special Auxiliary Committee on Medical Economics

REPORT OF THE COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION TO THE HOUSE OF DELEGATES

Gentlemen

Your Committee on Public Health and Medical Education begs leave to submit the following report for the current year

The resolution of the House of Delegates adopted at its last annual meeting on June 1, 1931 directing the Committee on Public Health and Medical Education with the Committee on Public Relations to make a study of the preliminary report of the Governor's Special Health Commission assigned a task to this committee which occupied the major part of its attention until January first of this year. Despite the amount of time devoted to this special study this committee has carried on its usual amount of work in graduate education and has been concerned with more public health activities than in any previous year

GRADUATE EDUCATION

Table 1 is a report of the graduate courses sponsored by the State Society for county medical societies under the direction of this committee during the current year. The title after each county refers to the subject of the course and the figure refers to the number of lectures given in that course

TABLE 1
Courses Given in 1931-1932

County	Subject	No of Lectures
Cortland	Traumatic Surgery	Six
Monroe	Preclinical Medicine	Four
Otsego		Eight
Schohar		Seven
Seneca	Traumatic Surgery	Six
Wayne	Traumatic Surgery	Six
Onondaga		Four
New Yc		Five
Orange	Traumatic Surgery	Seven
Sullivan	Internal Medicine	Four
Herkimer	Internal Medicine	Seven
Montgomery (and Fulton)	Internal Medicine	Seven
Tompkins	Dermatology	Six
Jefferson	Preclinical Medicine	Five
Saint Lawrence	Preclinical Medicine	Five
Chemung	Internal Medicine	Six
Steuben	Internal Medicine	Six
Rockland	Internal Medicine	Four
Oswego	Internal Medicine	Six
Madison	Internal Medicine	Six

(At the time of writing this report definite arrangements for the courses in Jefferson Saint Lawrence

Chemung, and Steuben Counties have not been completed but seem well enough assured as to be included in the above list.)

The committee has continued to keep detailed records of each course and submits herewith a comparative report of this work for the four previous years. It is impossible to include the work of the current year in this table in as much as several of the courses have not been completed at the time of writing this report. (Table two.)

was given twice. The latter course, which deals with practical subjects and especially emphasizes treatment, is being prepared under the general direction of the committee and will be arranged so that uniform lectures can be given on the same subjects by different lecturers in different localities. Standard lantern slides will be prepared for this course and mimeographed outlines of each talk will be given to all in attendance.

Twice during the past year two adjoining counties have

TABLE 2—COMPARATIVE SUMMARY OF WORK IN GRADUATE EDUCATION UNDER THE AUSPICES OF THE COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION FOR THE PAST FOUR YEARS

	1927-28	1928-29	1929-30	1930-31	1931-32
Total number of courses.....	21½	21½	16	21	20
Total number of lectures.....	116	105	91	116	115
Number of county medical societies before which courses were given	22	31	19	25	25
Total attendance of all courses	3268	4809	3296	3520	
Largest attendance for one course.....	(Albany) 495	(Monroe) 836	(Monroe) 841	(Monroe) 566	
Smallest attendance for one course.....	(Greene) 42	(Herk.) 66	(Rock.) 57	(Tioga) 59	
Total cost of all courses.....	4524.82	4777.07	3705.42	4898.33	
Average cost per course	215.47	217.96	231.59	233.25	
Average cost per county.....	205.67	154.10	195.02	155.93	
Average cost per attendance.....	1.38	.98	1.12	1.39	

A table which has been prepared to show the attendance of all courses during the past four and a half years is herewith submitted. As has been mentioned before it is impossible to furnish the figures for the last half of the current year as several courses have not been completed at the time of writing this report. In studying these figures such conditions as the size of the county, its geography, and the distribution of physicians according to age and type of practice must be considered. (Table three.)

Perhaps one of the best indications of the value of graduate education is evidenced by the repeated requests for courses in several counties each year. In the twenty counties in which courses were given during the current year twelve had courses last year. Four of these county societies, Tompkins, Chemung, Saint Lawrence, and Jefferson, have had a course each year during the past five years which covers the period that this work has been sponsored and financed solely by the State Society. Two societies, Monroe and Onondaga, have had courses annually during the past four years. Five societies have had a course this year after a lapse of two years of such work and one society after a lapse of four years. Two county societies, New York and Madison, for the first time, have had a course arranged by the State Society this year. The Bronx County Society should also be included with these as it participated in the course arranged for New York County.

The twenty courses given during the current year represent a total of 115 lectures. There were four 4 lecture courses, three 5 lecture courses, nine 6 lecture courses, three 7 lecture courses and one 8 lecture course. Eleven courses dealt with internal medicine, again demonstrating this topic to be the most popular subject of graduate lectures. This is also proof that the majority of the profession want instruction in that type of work with which they are most concerned. Five different courses in internal medicine were given during the current year two of which were given three times. One course on traumatic surgery, however, was presented on four different occasions. One course in dermatology was also given on three occasions. This was the first year that this course was held although it had been suggested by Doctor George M. MacKee at a previous time. Three new courses in internal medicine were added this year to the list of courses offered by the committee. One, outlined by Doctor Nellis B. Foster, was given three times; one, outlined by Doctor Luther Warren, was given three times; and, one planned by Doctor Clayton W. Greene,

combined for one course. Two nearby counties have agreed on the same course six times so that it has been possible to have the same lecture in one place in the afternoon and in another place in the evening, resulting in considerable saving of time and expense. In one instance the New York Central Railroad arranged for three special stops of its trains on the days of the lectures in order that such a plan might be carried out.

The Committee has continued to allow the different county societies to make their own selection of courses although it has gladly offered to advise them regarding their choice, an offer which has been cordially accepted. The committee has made changes in the outlines of some courses to suit the wishes of some of the county societies where this has seemed advisable and has otherwise modified its plans to comply with the needs of some societies. Fifteen counties have had lectures at weekly intervals. In one county the lectures were given twice a week, in another every second week and in two other counties once a month. The lectures in Monroe County were given on consecutive days as has been the custom in the past. One of these lectures was held at the time of the meeting of the Seventh District Branch in that county in order that the lecture might be available to the members of all the county societies in that District.

In connection with one course the committee arranged two clinical days and with another course one such day. All three days were available to the members of both county societies. Doctor Arthur W. Elting conducted a surgical day, and Doctor Nellis B. Foster a medical day in Otsego County, and Doctor Henry L. K. Shaw a pediatric day in Schoharie County. These clinical days proved to be instructive and of practical interest to both county societies. In association with both courses in physical therapy a seminar for the practical demonstration of this subject to small groups was arranged with local men acting as instructors. Both of these courses were available to the members of more than one county society.

Realizing the interest which county societies have maintained in graduate education and the demand for extension of this work which is apparent, the committee has considered favorably a plan to establish, in connection with some of the medical colleges of the state and in cooperation with the medical society of the county in which such college is located, clinical periods of from one to four weeks instruction. Although under such a plan those attending the clinical period would have to reside at the place of instruction during the time of the

* Inasmuch as half of this course was given in the spring and the other half in the fall a percentage can not be given for the full course.
* Cards reporting the details of the lectures were not returned, and, therefore, a final report can not be given.

session, nevertheless, more extended education could be provided along lines not now possible. While it is not expected, because of the personal expense and the time involved, that the same number of members of even nearly by county societies would avail themselves of such an opportunity as do now of the weekly lecture course in their own immediate locality, it is believed that a sufficient number would register to justify the establishment of such a course. The committee has no thought of abandoning its present plan of taking the weekly lecturer to the county society but rather to supplement this with more extended work. It feels that an absolute essential to such a plan is the wholehearted cooperation of the society in the county in which such a course of instruction would be offered and that that society should actively partake in the work. In as much as such a plan has been carried on satisfactorily and successfully in one county your committee feels that it could extend this work to other parts of the state providing that the House of Delegates votes its approval of such a project.

The details of this report indicate the time and the attention which your committee has given in order to provide the members of this society with as satisfactory post-graduate education as means and conditions will allow. In return for its labors the committee has received excellent cooperation from the officers and committees of the various county societies. The committee has been fortunate in the advice which has been extended most cordially to it by experienced medical educators.

To these gentlemen, to the different lecturers and to all others who have contributed their efforts to the success of this work the Medical Society of the State of New York is indebted and we believe expresses its sincere thanks. Not only the importance of this work but also its need is expressed repeatedly by the individual physician, the teacher, and the health worker alike. Where state university exists this work has become a well recognized function of such institutions. Where no state university exists, the State Medical Society must accept this responsibility.

PUBLIC HEALTH

The committee's participation in public health matters has been especially marked by its cooperation with other organizations. A growing tendency to recognize the value and necessity of the cooperation of the medical profession in these affairs is most apparent. Certain organizations are to be especially commended for strictly adhering to this policy. Your committee has made every effort to work harmoniously with such organizations and by results has demonstrated to others the desirability of united effort.

MATERNITY CENTER ASSOCIATION

A cooperative venture for the dissemination of a better knowledge of adequate maternity care which has been developed during the current year between the

Maternity Center Association of New York City and the State Medical Society especially merits a word of comment. The desirability of the movement seems to us unquestionably essential. It is an effort through the medium of ethical publicity to instill into the minds of the public the need for early consultation in pregnancy and the advisability of securing satisfactory medical and nursing care.

The Maternity Center Association is a well sponsored lay organization which has attracted a great deal of attention by its work in New York and elsewhere. Its policy has always been one of close association with the medical profession. The campaign referred to is entirely financed by the organization and the state-wide publicity given to the same has evidently met with an encouraging response from all sides. A venture of this kind should be encouraged by the organized medical profession of the State because it will further develop a spirit of cooperation and community activities which is most desirable for all concerned.

A summary of the salient features of this cooperative venture includes the following: On January 15th, the NEW YORK STATE JOURNAL OF MEDICINE published a brief article entitled "Teaching the Public the Need for Proper Maternity Care." Five reprints of this article were mailed to each of the 21,000 physicians in the state. A release signed by Mrs. John Sloane, the President of the Maternity Center Association was sent to every newspaper published in New York State, as well as to a selected list of medical journals. A reprint and letter describing the plan were sent to 2,024 presidents and secretaries of County Medical Societies throughout the country, as well as to presidents and secretaries of all State Medical Societies, and to about 1,200 Commissioners of Health—State, county, and local.

Among the results of this campaign we may note that the physicians of this State have ordered over 5,000 copies of the circular for distribution to their patients, and many letters were received from various sources commending the plan. The cooperation of the newspapers was excellent—200 clippings have been collected to date. The movement likewise has extended elsewhere, and doctors in 32 states have voiced their approval of the scheme and have asked for the circulars to be distributed in their local societies.

SARATOGA SPRINGS COMMISSION

The Saratoga Springs Commission, which has under its direction the development of Saratoga Springs as a health resort, has accepted as an underlying principle in its work, the approval of its plans and aims by the medical profession. Your committee was therefore very glad to cooperate with this commission, which is ably represented by its medical members, in arranging for its special advisor, Doctor Ernest Groedel, to address medical groups in various parts of the state. Unfortunately several of these meetings had to be cancelled due to the necessity of Doctor Groedel returning to Germany on account of the sudden death of his wife.

STATE DEPARTMENT OF HEALTH AND POLIOMYELITIS

This committee has continued to cooperate in a cordial manner with the State Department of Health. On July twenty-ninth the chairman of the committee met with Commissioner Parran of the State Health Department at his request to consider matters pertaining to the spread of Poliomyelitis through the state which disease at that time was showing a sharp increase in New York City. At this conference Doctor Lawrence, Executive Officer, was also present. It was suggested to Commissioner Parran that it might be well to have a sub-committee on Poliomyelitis appointed by the President of the State Society and composed of physicians who for some particular reason would be especially qualified to act as

advisers regarding the disease. Commissioner Parran readily approved of this plan and requested that such a committee be appointed. Accordingly the following men were nominated to the President of the State Society to serve on this committee:

Dr. Charles Hendee Smith—New York.
Dr. Walter D. Ludlum—Brooklyn.
Dr. Henry L. K. Shaw—Albany.
Dr. John A. Card—Poughkeepsie.
Dr. Stanhope Bayne-Jones—Rochester.
Dr. Clayton W. Greene—Buffalo.
Dr. Wardner D. Ayer—Syracuse.

The entire committee with the exception of one member whose notification was delayed met with Commissioner Parran in Albany on August sixth, eight days following the conference of the chairman with the Commissioner at which time this matter was first discussed. This sub-committee considered with the Commissioner the question of collection and control and use of immune serum, arrangements for consulting diagnostic service, and arrangements for medical meetings at which talks on poliomyelitis were to be given. A letter was promptly sent to officers of all county medical societies and the chairmen of the Public Health Committees of the same societies advising them on matters regarding poliomyelitis and requesting the arrangement of special meetings when an outbreak of the disease seemed eminent in their locality. Meetings were immediately arranged for all the county societies in the region of the Hudson River. These meetings were addressed by Doctor Draper whose services were secured by the State Department of Health. The meetings, however, were arranged by Doctor Shaw for this committee and included the following county societies: Schenectady, Albany, Rensselaer, Saratoga, Warren, Washington, Ulster, Sullivan, Orange, and Dutchess-Putnam. Doctor Ayer of Syracuse addressed the counties of Broome, Tompkins, and Chenango. Doctor Ludlum arranged for a meeting in Kings County and a meeting was held in New York County.

Fortunately, the disease throughout the State was not as extensive as was first thought probable. Nevertheless, the Medical Society of the State of New York can take credit to itself for the way its members prepared themselves to handle a greater outbreak of the disease had it occurred. Commissioner Parran has been notified that the sub-committee on Poliomyelitis would be ready to meet with him again to review the records of the 1931 outbreak of this disease and make recommendations for the control of future outbreaks. The Commissioner has not availed himself as yet of this offer.

STATE DEPARTMENT OF HEALTH AND MATERNAL MORTALITY STUDY

At the request of the State Commissioner of Health Doctor Kosmak and the Chairman of this committee met with Commissioner Parran, Doctor Gardiner, Director of the Division of Maternity, Infancy and Child Hygiene of the State Department of Health, and Doctor Griswold of the State Department of Health on January twenty-seventh in New York City for a conference regarding a proposed study of maternal mortality to be conducted by the State Department of Health. This conference occurred at the same time and place as did the January meeting of the Public Relations Committee, the Chairman and the members of which were invited to participate in the conference. The subject of maternal mortality has occupied the attention of this committee for several years as noted in its annual report of 1928 and the Committee has regretted that it lacked the necessary facts upon which to base a definite report dealing with this matter. Therefore in view of the fact that the State Department of Health was desirous of making this study in conjunction with the State Medical Society, that the final report would be a joint publication of both organizations, that the plans must first receive the approval of

the appropriate committees of the state and county medical societies and that all moot questions should be referred to the Public Health Committee of the State Society and the Commissioner of the State Department of Health, the committee recommended that the Executive Committee give their approval to this study and that county medical societies be asked to cooperate in this investigation. The secretary and the chairman of the public health committee of each county medical society except the counties of greater New York have been notified of the intention to make this study by the State Department of Health and have been asked to cooperate in this work. With this letter of notification was sent an outline of the plan of the contemplated study. Your attention is particularly directed to the fact that the first call of the interviewer in any county will be made upon the President and Chairman of Public Health Committee of the County Society acquainting them with the purposes and method of conducting the study, that the results of the local inquiries and conclusions to be drawn therefrom are to be discussed and agreed upon by the Chairman of Public Health Committee of the County Society and representative of the State Department of Health and that all moot questions are to be submitted by the Commissioner of Health to a reference committee comprising the Public Health Committee of the State Medical Society, the State Commissioner of Health and such other members as suggested by the Reference Committees. Twenty-six county medical societies have replied as to whether their society will cooperate in this study of maternity mortality. Nineteen have already answered in the affirmative, three indicate that they probably will cooperate in this investigation and in four county societies the answer is delayed pending a meeting in the near future of that society.

STATE DEPARTMENT OF HEALTH AND REPORT OF TUBERCULOSIS

The committee is studying the subject of the reporting of cases of tuberculosis for the purpose of advising the State Department of Health in this regard and a conference, to be held at a date subsequent to the writing of this report, has been arranged between representatives of that department and Doctor Whipple, representing this committee, to consider this matter.

OTHER ACTIVITIES

As in the past the committee has aided several county societies, some of the district branches and various medical organizations in preparing their programs and securing capable speakers. The committee has been represented at many county society and district branch meetings. The chairman has attended meetings of some of the other standing committees when so requested.

The committee has held nine meetings during the current year, eight of which were meetings of the Joint Committee to study the report of the Governor's Special Health Commission. Despite the added expenditures due to making that study, the committee hopes, by the practice of wise economy, to finish its work for the year within its usual appropriation. As a result of its

experience in meeting with representatives of county societies throughout the state, while engaged in studying that report, the committee is in a position to advise and direct these societies in regard to their health plans and problems. The committee has considered with representatives of several county societies the advisability of establishing county health departments under the present permissive law, and has offered its services in arranging meetings of such societies to discuss that subject. The committee has delayed further work in education regarding county health departments because of a recent ruling of the Public Health Council as to the qualifications for county health commissioners which, it believes, would make difficult the appointment of a health commissioner from the local medical profession, and is therefore not in harmony with the ideas and intent of the House of Delegates when they acted on the report of the joint committee. Consequently, at its last meeting this committee and the Committee on Public Relations, which met jointly with it and approved such action, directed the Chairman of this committee to appoint a sub-committee to appear with him before the Public Health Council to oppose such ruling. This is a proper place to call to the attention of the House of Delegates that as now constituted there is only one practicing physician on the Public Health Council and also to the fact that whereas the rulings and regulations of that body are binding only in that part of the state outside of New York City, its public hearings are held in that place. This action should be strongly objected to by the House of Delegates as being manifestly unfair by reason of distance to those most affected by its actions.

The members of the committee have given an increasing amount of time and service to the work of the committee. Their spontaneous and continued interest in the activities of the committee have been an inspiration to the chairman.

During the past year the committee lost by death one of its most influential members, Doctor John O. Polak. Doctor Polak had been most faithful in attending the meetings of the committee and was always ready to accept any extra task out of the usual routine duties. Because of his gifted ability as a medical teacher and his years of experience as an obstetrician he was a most valued member of the committee.

The cordial relations with the other standing committees have continued to exist during the past year especially with the Committee on Public Relations because of the close association of the two committees in making in a harmonious way the joint study of the preliminary report of the Governor's Special Health Commission. The chairman wishes to acknowledge the cooperation which he has received from the President, the President-elect, the Secretary, the Treasurer, and the Executive Officer of the society. The latter has relieved the chairman of many arduous details by his helpful activity. The chairman acknowledges to the House of Delegates the secretarial help which has been offered him and which has greatly facilitated the routine work of his office.

Respectfully submitted,
THOMAS F. FARMER, M.D., Chairman,

April 15, 1932.

REPORT OF THE COMMITTEE ON PUBLIC RELATIONS

To the House of Delegates —

Gentlemen:

Your Committee respectfully reports that the membership of the Committee remains the same as of the previous year, except that Dr. William H. Ross of Brentwood, Long Island, was appointed to the position left vacant when Dr. William D. Johnson became your President. Dr. Ross was elected Secretary of the Committee, and Dr. Joseph S. Lawrence, Field Officer.

Throughout the year the Committee has endeavored to carry on its many activities developed during the preceding years, and to effect proper cooperative and coordinate relationships with the various State Departments, and the voluntary and social agencies that are devoting attention to health and welfare work in the counties of the State.

It is a pleasure to report that all efforts made by this Committee towards harmonizing the health interests in the State have been appreciated by those with whom we had to deal; hence we were able to confer upon many problems in an amicable manner, and in no instance has there been lack of harmony or lack of that cooperating spirit which must exist if the health interests of the public are to be conserved, cooperative relationships established, and the standards of medical practice upheld.

We still consider the work of this Committee as having a most important bearing upon the future standing of the medical profession, as well as upon the health of the people of the State; nevertheless we are convinced, after several years of experience, that it is not at all difficult to establish proper cooperative relationships with the governmental and lay agencies, or to impress upon them the importance and wisdom of the medical profession leading in such matters.

Lecture to Medical Students. Early in the year a letter was submitted to the Deans of the medical schools in the State suggesting that they provide some facilities for senior students to become acquainted with the various laws having to do with medical practice especially the Public Welfare Law. This letter was most favorably received and four of the medical schools requested that the Public Relations Committee furnish from its membership a physician to deliver these lectures. The Committee thereupon invited Dr. William H. Ross to accept this responsible position. We are pleased to report that our former President is delivering the lectures and instructing the third and fourth year medical students upon all laws having to do with medical practice in this State.

We regard this as an important advance since it means that in the future our medical students, before graduation, will have a theoretical knowl-

edge of the laws governing the practice of medicine in the State of New York.

The following contribution by Dr. William H. Ross defines the plan and scope of these lectures:

"This talk will undertake to show the influence of organized medicine on medical education and upon medical science, the protection of the public from the impositions of untrained persons assuming a knowledge of medicine, and the influence of a proper adjustment of relationship to changing conditions. It is the first effort on the part of the profession of medicine to talk to those about to become a part of it regarding the practical things that will confront them when they begin private practice and will show the influence of medical societies upon all medical laws and codes.

"Organized medicine is undertaking to interest advanced students of medicine in its activities and in the protection of the economic interests of the profession of medicine. The Public Relations Committee will discuss with the graduating classes the value of membership in the county, State, and national organizations. This message will be from the viewpoint of the private practitioner of medicine and the purpose is to make the transition from the fields of scientific training into the fields of the practical application of that training easier than it would otherwise be.

"There will be a discussion of existing medical laws and the value of medical leadership in the administration of these laws. There will be an effort to show that organized medicine owes the obligation of leadership in the solution of social problems connected with sickness; that the activities of medical laws to meet social needs coordinate with the work of the practicing physician when the service is rendered by the family physician; and that the economic welfare of the profession is advancing by cooperation with the administration of medical laws under the leadership of medicine.

"The purpose of this talk is to give medical students an idea of what is meant by organized medicine. It is an effort to help a fuller realization of the fact that they are soon to become a part of the profession of medicine, and that they have the opportunity to secure certain valuable privileges and protection from membership in their county and state societies. It will touch upon the increasing complexities of social and economic needs, and will point out that it is quite likely that we are in an era when an increasing number of laws will be enacted, and that the profession of medicine should prepare itself by better organization to take its place in the administration of these laws and to pay attention to its own *economic relation to them.*"

Cooperation with the Committee on Public Health and Medical Education. This Committee feels that Medical Public Relations and Public Health are so interlocked that it is difficult at times to separate the two; hence in our deliberations throughout the year we have been favored by having with us the Chairman of the Committee on Public Health and Medical Education, whose advice and counsel have been of very decided value, and we wish to express to Dr. Farmer our thanks and appreciation for the assistance rendered to this Committee.

At your last Annual Meeting held in Syracuse, you instructed that the Committee on Public Health with the Committee on Public Relations study the report of the Governor's Special Health Commission and make recommendations upon all or any of the subjects presented, and that the said Committees report their recommendations to the House of Delegates not later than January 1, 1932.

To comply with the instructions of the House of Delegates adequately and properly involved a vast amount of work extending over a period of nearly eight months during which time the two Committees acted as a Joint Committee. The Joint Committee met to discuss the health report, here and there in various sections of the State in order to get the full view-point of the medical profession.

Dr. Thomas P. Farmer of Syracuse was Chairman of the Joint Committee. Under his leadership the meetings were conducted in a way which received approval of all. At this time the members of the Public Relations Committee desire to express their appreciation of the service he rendered to the Committee and the Medical Society of the State of New York.

Inasmuch as the meetings of the Joint Committee were held weekly and the interval between the meetings necessitated a large amount of study of the material developed, it was necessary for your Committee on Public Relations to omit for the time being much of the other work which would normally have been carried on. Nevertheless, the study made by the Joint Committee was likely to have such a wide bearing upon the question of future Medical Public Relations and Public Health in this State, it seemed essential to devote our best energies to the fulfillment of this task which resulted in the final report of the Joint Committee which was submitted to, and, in the main, received favorable action from the House of Delegates at its special meeting in Albany, January 14, 1932.

The study of the Report of the Governor's Special Health Commission gave the Public Relations Committee a splendid opportunity to become more intimately acquainted with the activities of all the county medical societies. It was apparent that leaders in the medical profession are influencing health and welfare programs by ad-

vocating measures which are sound, scientific and economical.

The Committee is convinced more than ever of the need of an active, progressive Public Relations Committee in every county medical society.

While this study took many months of hard work as well as an expenditure of a very considerable sum of money, it is thought that both the time and the money were well expended and that both Public Health and Public Relations in the State of New York have been advanced as a result thereof.

At a conference of the Governor's Special Health Commission, to which Dr. Farmer and myself were invited, much commendation was expressed over the attitude taken by the Medical Society of the State of New York with reference to the report of the Governor's Health Commission; and the general expression seemed to be that there had been a cooperation developed which would mean much of worth to the future of Public Health and preventive medicine.

Cooperation with the Department of Social Welfare. Upon invitation from the Chairman of the Department of Social Welfare our Committee has assisted in formulating rules and regulations with reference to the recently enacted amendment to the Social Welfare Law placing all hospitals of the State, irrespective of public or private ownership, under certain rules and regulations of that department. We feel that this indicates the establishment of an important cooperation, and especially so since your President in his Annual Report of 1928 suggested the need for some governmental control of the privately owned hospital.

Greater New York Coordinating Committee. The Committee has taken an active interest in the work of the Coordinating Committee of the Five Counties composing Greater New York. Its monthly meetings have usually been attended by the Chairman of this Committee and the Executive Officer of the State Medical Society. The medical problems confronting the counties of Greater New York, while not so different from those of the up-State counties, vary greatly in magnitude and have a vast influence on the practice of medicine, not only in their own locality but throughout the state and nation.

Examination of School Children. The Committee has recently held an important conference with representatives from the Department of Education with reference to developing a greater interest by the family physician in the pre-school examination of children. It is a lamentable fact that throughout the up-State section only 15 per cent of these examinations are made by the family physician. The Department of Education deplores this lack of interest upon the part of our profession, and would welcome the development of such plans as would result in a large number of these examinations being conducted by the

physician of the family. Your Committee on Public Health and this Committee in conjunction with the Department of Education will endeavor to formulate some methods whereby this defect upon the part of the medical profession will be corrected, thus inculcating in the minds of the children during their formative years the thought of an annual health examination, by the regular medical attendant of the family, thereby preparing the future adults for a continuance of this care of and attention to health matters and the necessity for an annual health audit.

Regional Conferences of County Chairmen. Your Committee has deemed it wise to abandon the plan of an annual meeting of the chairmen of the County Public Relations Committees and in its stead have adopted the plan of having several regional conferences where the Committee would meet with the chairmen of some ten to fifteen counties and discuss their problems in a more direct and intimate manner than would be possible at a large conference. We are finding that this plan is much more satisfactory and is productive of greater stimulation to the County Chairmen, all of whom desire to take their work seriously and to carry home some additional plan for their Committee to act upon. At these regional conferences your State Committee has become impressed by the volume of work that is being actually performed along the line of Medical Public Relations by some of the counties, this being especially so where the Public Relations Committee of a county society is led by a man who exercises his leadership and impresses upon other groups working in the health field the importance of their being directed by the Medical Society of the county. The report from one of our counties (Warren) printed in the April 1st issue of the NEW YORK STATE JOURNAL OF MEDICINE speaks in no uncertain terms of how all health questions in that county are referred to the Medical Society of the county for adjustment. This is only one of many counties throughout the state where this most desirable condition exists.

Personnel of County Committees. Your Committee is occasionally embarrassed in its work by county medical societies changing the personnel of their Public Relations Committees. We recognize that this may at times be essential, but in the main, it disrupts the work in that particular county, therefore it should not occur except for a sufficient reason.

Your Committee would appreciate any assistance from the House of Delegates along the line of encouragement of County Medical Societies in selecting their County Public Relations Committees, to observe the following:

1. Select men who have outstanding qualifications as leaders in medical thought in their community and who will give of their time to the work entailed.

2. When such County Committee, and especially the Chairman, is carrying on the work in a satisfactory manner there should be as little change in personnel as possible.

3. All chairmen of county committees, and when possible, the entire committee, should attend the regional conferences with the State Committee and become acquainted with the work required.

We believe that as a State Committee we should be in close touch with our sub-committees in the county medical societies; and that they should be shown the advantage of working harmoniously with the lay organizations. Such harmonious action is best accomplished by having a prominent member of each county medical society a member of one or more of the lay organizations which are working in that county. In this way any feeling which may exist between the medical profession and any one of these societies may be overcome and the health work carried on more successfully to the advantage of the public and the medical profession.

By repeatedly urging our County Relations Committees to coordinate the health activities in their respective counties much can be accomplished.

Cooperation. We are thoroughly convinced that a constant contact must exist between the Public Relations Committee, the State Department of Health, and the many lay organizations working in the health field.

As yet we have made no direct contact with the New York State Institute for Cancer Research, and believe that this should be accomplished during the coming year.

We desire to express our appreciation to the Editors of the NEW YORK STATE JOURNAL OF MEDICINE for giving space and publishing all articles submitted relating to the work of the Committee; also to our President, Dr. William D. Johnson, for his faithful attendance at our meetings and wise counsel in helping to direct the work of the Committee. Through the courtesy of the Executive Committee, Dr. Joseph S. Lawrence, Executive Officer, has been allowed to give much of his time and effort to the work of this Committee, and we wish to express to him our keen appreciation for his untiring efforts.

Many complex and disturbing conditions arise throughout the year, some of them of importance to a local group, others of great importance to the medical profession as a body. Our endeavor has always been to adjust these matters upon the broad principle of doing what is best for the welfare of the people and still uphold and advance the future of medical practice in our State.

Respectfully submitted,
JAMES E. SADLIER, *Chairman.*

April 15, 1932.

REFERENCE COMMITTEES FOR 1932

Dr John A. Card, Speaker of the House of Delegates, has appointed the committees to whom the reports of the officers and committees are referred for consideration and suggestion of action. The early publication of both the reports

and the personnel of the reference committees will afford the members of the State Society the opportunity to express their opinions, and their representatives in the House of Delegates to reflect the attitude of their constituents.

NEWS NOTES

CONFERENCE ON HEALTH CENTERS

The Tenth Annual Health Conference of the Milbank Memorial Fund received from its section on Health Centers, of which Surgeon General Hugh S. Cummings, U.S.P.H.S., was chairman, the following summary of the deliberations of the section, which were accepted.

The health center movement in New York City was briefly reviewed. Emphasis was given to the value of intensive organization in this city as an effective method of assuring greater public health protection to the people in every section of New York. The Committee on Neighborhood Health Development of the Health Department was created in 1929 to study the work and to assist in establishing a city-wide and intensive program of neighborhood health service. Already, in the development of this policy, a health center for Harlem has been established. An appropriation for one million dollars for four additional health center buildings has been made.

A health center is a community agency engaged primarily in preventive medicine and public health education, centering around an organization of physicians, health workers, and laymen. It aims to reach all people within a district who need the services, and to coordinate the health, and often the recreation and social service activities of the area. A health center building has been defined by the Neighborhood Health Committee as a neighborhood headquarters from which all health and related social services are administered for a specified district.

In planning the program for a health center district, several factors are considered, including the size, constitution, social, and economic status of the population, as well as the principal health problems of the community. The health center is one of the important intermediate links in the chain of influences beginning at the hospital and extending to the individual home. The types of service to be rendered depend upon local condition. More and more, however, is the family being regarded as the fundamental biological and sociological unit. To be fully effective therefore, a health center program must be developed with the aim of serving the family as a whole.

The plan for district health centers, operated in conjunction with a central health department, involves some realignment and strengthening of field work on a neighborhood basis that will recognize the particular needs of the area. Medical treatment is reserved for existing hospitals and clinics, but through improved organization more adequate services are stimulated. Persons of a sufficient economic level

are encouraged to a greater use of their family physician when conditions indicate the need.

In order that district health center services may be developed and function effectively, there should be a Director of Health Centers in the City, directly responsible to the Commissioner of Health. This Director should be a trained and experienced medical officer of health. He should be in a position to visualize the health center needs and opportunities in the city as a whole in relation to the organization and resources of the City Department of Health. Each health center should be in charge of a district health officer. He should have the benefit of counsel from a local neighborhood health committee and from local medical and dental organizations.

From the presentation of experiences of health centers in different localities, including Boston, Los Angeles County, and New York—East Harlem, Bellevue-Yorkville, and Central Harlem,—several important suggestions were obtained, as follows:

1. Through a Neighborhood Health Center Plan, it is possible to bring together both health and welfare agencies, official and non-official, on a team-work basis, with results of coordination of district services, promotion of constructive health work, and improved understanding among the workers.

2. The principal functions of a health center are to provide:

- (a) Administrative service, official and non-official, including neighborhood health and vital statistics studies.
- (b) Health Education.
- (c) Medical and Dental participation, e.g. Maternity and Child Hygiene, Mental Hygiene, Diagnostic Services, Tuberculosis, Venereal Diseases.
- (d) Preventable Disease Control.
- (e) Public Health Nursing.
- (f) Inspection.

3. Several new and desirable health services may result in a district from the establishment of a health center.

4. It may be desirable to promote treatment service in a district where it is not available or accessible, and to aid in coordination where such service is available and the opportunity is presented.

5. Provision should be made for the current analysis of health needs in a district by trained workers.

6. Close relationships should be established with the local medical and dental professions (See vote of the Committee below).

7. Neighborhood health center committees are essential.

8. Careful plans should be formulated to secure the integration of a district program with central health department service.

While it is possible to develop certain fundamental principles of health center organization and service which may be generally followed, it was emphasized that no single uniform plan will suit in detail all districts. A health center plan must be adapted to fit the local needs of each district. Furthermore, there should not only be studies of the needs of a district before a health center is established, but there should also be developed methods of evaluation of services rendered.

It may be appropriate to state that following a request from the Neighborhood Health Com-

mittee, the Division of Research, on recommendation of the Technical Board of the Milbank Memorial Fund, has undertaken a series of studies in regard to the needs in certain districts, the best public health procedures and types of administrative organization for the new municipal health centers in New York City.

Considerable discussion was given in the conference to the importance of close cooperation with the Medical Profession in the planning and conduct of health center work. As a result, the following statement was adopted:

"Every health center should have as one of its important functions a definite program for the development of cooperation between families and physicians to the end that there shall be more universal participation (outside of official health work) in preventive medicine and health promotion.

"This would involve the development of such a program through county medical societies and the adequate provision of personnel for the organized medical profession."

ON TO NEW ORLEANS

President Johnson has appointed Drs. John A. Card, of Poughkeepsie, and Arthur W. Booth, of Elmira, a Transportation Committee for the American Medical Association meeting in New Orleans, beginning May 9, 1932.

The Committee has arranged for the New York delegation to leave New York on the Pennsylvania Railroad, Saturday, May 7, 1932, at

8:10 A.M., Eastern Standard Time, arriving in New Orleans Sunday evening.

Several Pullman cars have been placed at the disposal of the Committee and tentative reservations for drawing rooms, compartments, or berths may be made by applying to Dr. John A. Card, Poughkeepsie, N. Y.

RENSSELAER COUNTY

A regular meeting of the Rensselaer County Medical Society was held at the Troy Hospital on March 8, 1932. There were forty-five members present.

After a short business session a scientific program was carried out by the members of the hospital staff as follows:

1. Acne Keloid—Dr. F. J. Fagan.
2. Cardiac Arrhythmias—Dr. John J. Quinlan.
3. Post Encephalitic Parkinsonism—Dr. C. J. Handron.

4. Interstitial Keratitis—Dr. J. D. Carrol.

5. Tuberculosis of the Breast; Tuberculosis of the Prostate—Dr. John H. Reid.

Lantern slide demonstrations of gross and microscopic sections—Dr. J. J. Jaffarian.

6. Hydrocephalus—Dr. J. O. Sibbald.

The scientific session was followed by a luncheon provided by the hospital.

WM. B. D. VAN AUKEN, *Reporter.*

compensation for services to the needy poor are provided for in Section 3480, General Code.

"It is mandatory under this section that a physician attending a person entitled to relief under the poor laws shall notify the township trustees or municipal authorities within three days after medical care is given or such services begin in order to obtain compensation for his services.

"Obviously, in some instances physicians have been put to considerable difficulty to notify the proper officials in writing within the three-day limitation. In some communities, this provision has been liberally construed by township and municipal officials, especially when it has been possible for the physician rendering service to explain why a delay in notification was unavoidable.

"In some parts of the state, physicians have had considerable difficulty in securing adequate payment for service rendered under the poor law, due to an unsympathetic attitude on the part of township trustees or city officials, or to their lack of a realization of what is adequate compensation for various types of medical service.

"Some county medical societies have ren-

dered their members valuable service in this connection by holding conferences with township and municipal officials at which the questions of fees and other problems having to do with the poor laws have been discussed and a proper understanding reached as to the responsibilities of public officials, not only to indigent persons requiring medical service, but to the physicians rendering such service. In most of the counties where a spirit of understanding and cooperation has been developed by effective and concerted effort on the part of the local medical profession, little difficulty and misunderstanding regarding fees and other functions of both officials and physicians have resulted.

"Any effort to have written into the law a definite fee schedule or a reference to any existing fee schedule has always been discouraged by the Committee on Public Policy of the State Association. That committee has been of the opinion that, if such a fee schedule should be adopted by law, the public generally might feel that those were the standard legal fees for various types of medical services. Also, that such enactment might eventually result in legal involutions of an undesirable and embarrassing nature."

Ohio and cooperate with local units in coordinating all work in child health and protection, announced that the committee was not prepared as yet to announce the names of organizations selected, but that it hoped within the next few weeks to have compiled a complete list of organizations and agencies. These groups will be asked to name representatives on the central committee which will then undertake the formation of a tangible program to stimulate activity throughout the state in the questions discussed by the conference. Dr. J. H. J. Upham, dean of the College of Medicine, Ohio State University, is a member of the committee undertaking the selection of the groups which will be requested to name representatives to the permanent state-wide committee."

HEALTH EDUCATION IN NEBRASKA

An editorial in the March number of the *Nebraska State Medical Journal*, by Dr. J. S. Welch, Chairman of the Committee on Medical Education of the State Association, sets forth some of the demands upon the Committee, as follows:

"On every side and in the most innocent manner, one sees social medicine pushing itself in upon the practice of the medical profession. Illustration No. 1:

"Lady over phone: 'Hello, Doctor. This is Mrs. Gray. I want to ask you a question. My boy came home from school today with a note from the school nurse. It says he should be immunized against diphtheria, and that we should take him to our doctor and have this done, or if we wish, the school doctor and nurse will do it for us. Now what I want to know is, is this O.K.?' You say it should be done. 'Well, can you do it for us?' Yes. 'What will it cost?' 'Five dollars?' 'Well, if this school (public tax money) will do it for us, why not let them do it? Can they do it safely?' 'Well, thanks, Doctor. If you think they can do it and it should be done, we'll let them do it. Five dollars is five dollars these times. Thanks. Goodbye.'

"Here you have the doctor making the final sale to the patient of a perfectly proper piece of practice, but instead of getting the professional business himself he not only loses the work but pays the school district for doing it.

"Illustration No. 2:

"A letter to Dr. G. B. C. The envelope bears the return sign of the Secretary of the Y. W. C. A. The letter within reads: 'Dear Dr. C. Would it be imposing to ask you to teach a few

(Continued on page 509—adv. xvii)

(Continued from page 508—adv. xvi)

classes for us this season? The Public Health Department has sent us some literature which seems to have resulted from the Child's Welfare Conference at Washington last year, and they urge us to get this information to our women. The facts in the matter are, several women have asked for pre-natal instruction and some others for sex hygiene, some of the very subjects the Public Health Department wish taught. We asked the County Medical Society, and they said neither they nor the State Association had any provision for such instruction. One woman volunteered to get a nurse to do the teaching, and I find she is a good intelligent woman with much practical experience, but she is not even a registered nurse. What can you . . . , etc.

"Here we have the tax-provided school district paying one of our profession to advise them what is safe and sane and proper for the health of our children, and yet we as a profession have set up no machinery even to meet the need, when in reality we should have conceived, first the way to handle it, and then next put the execution in process.

"What evil influences are resulting?

"You say it is taking work away from the doctor to whom it belongs. Yes, but that's not new. Doctors constantly do things for humanity which lessen their practice—prevention rather than cure, constantly illustrates that factor. A much greater evil lies in the constant tendency to 'Hired Doctors,' 'State Medicine,' 'Industrial Medicine,' 'Charity Clinics' (often where charity is not needed). It tends more and more to municipal, county, state and federal hospitals and doctors. And I ask you again to stop and estimate how much the practice of medicine and the care of the sick and injured will degenerate as we go farther into this type of practice. I ask you who will suffer most—the doctor or the people; and every doctor will answer in the same usual altruistic way, 'the people.'

"What can be done about it? Take at once some active step in health education leadership. Set up an organization in the State Association to direct this leadership in county societies, with the Extension Departments of our universities and colleges, who are literally begging the State Medical Association to come to their aid, with health education in meeting thousands of women in mothers' clubs, children and youth 4-H clubs, parent-teacher groups, etc.

"Your committee on Medical and Health Education and your Public Activities Committee are literally shouting these things at the Council and the State Association. These two illustrations are actual facts and can and will be duplicated as space and opportunity present.

As a member of both of these committees, I consider it my duty to bring again and again these convictions before your minds. There is no haste and no heat behind this conviction. We respectfully request you to weigh carefully these problems and do some constructive planning. Our plan may not be the best. If not, please help us improve it."

MEDICAL DIRECTOR IN NEBRASKA

The appointment of a Medical Director was discussed at the Annual Councillors' meeting of the Nebraska State Medical Association as reported in the March Journal of the State Society. The Committee on Medical Education sponsored the suggestion, as follows:

"Your committee recommended two important things at the last State Medical Association meeting:

"1. Postgraduate work for doctors over the state.

"2. Early selection of an Executive Secretary or Director, to serve under the Council.

"We were pleased with the earnest consideration given our recommendations. We feel certain they are constructive. We expected difficulties. These appeared. Some were financial. Some based on difference of opinion. Some men felt the plan contemplated too rapid and too big a change. Doubt and general uncertainty necessitated further consideration before obligating our organization. Our committee was pleased to have these recommendations referred for further consideration to a group comprised of the president of the Council, the president of the Association, the secretary of the Association, and one member of our committee.

"It is believed that such an officer (Director) would be of great value to the Nebraska State Medical Association. In addition to the promoting of the educational plan his relationship with the personnel of the organization would enable him to foster a better state of professional health in the county societies, to increase the membership, to interest the members in the vital necessity of adequate protection and to advance the standard of ethical relationship between the members.

"The work of such an officer under the direct control and supervision of the Council could offer relief from much of the drudgery now required of other departments in the organization. It would also avoid duplication of service.

"It is suggested that inasmuch as all of the director's time would not be occupied with the administration of the educational program that a part of the work now done by the Pub-

(Continued on page 511—adv. xix)

(Continued from page 510—adv. cont.)

lic Activities Committee be merged with the work of the educational program thereby securing adequate funds to permanently support this office, and any excess amount derived from the educational program would revert to the general fund.

"Your committee on Medical Education agrees and urges the acceptance of these recommendations

"1 Secure a director or executive secretary
"2 Assign him any tasks under the control of the Council, such as

"(a) Defense Committee work
"(b) Public Activities Committee work
"(c) Certain journalistic duties now done by recording secretary's clerk

"(d) Campaign and legislative work
"(e) Health education through various lay avenues, and

"(f) Later, postgraduate work when acceptable to doctors

"3 Budget this director's salary and expenses from part-time salaries and expense allowances already in our program

"We believe the present budget of the Association would provide or the necessary expense of the office and leave a fairly attractive salary for the director"

MALPRACTICE SUITS IN COLORADO

The March number of *Colorado Medicine* contains the following article on Malpractice Epidemics, in the Secretary's department

"Malpractice suits against doctors appear to constitute a contagious disease, likely to reach epidemic proportions in times of economic stress. Modern history shows this to have been the case in the past. Current experience indicates that we are in the midst of another such epidemic

"It seems to be an axiom of preventive medicine that epidemics of contagious diseases are preventable. It should be an axiom of medical organization that epidemics of malpractice suits are preventable

"Our Committee on Medical Defense has set up for the State Society a comprehensive plan of medical defense which possesses all necessary potentialities. The plan was published in the November and December, 1931, issues of *Colorado Medicine* and in the *Medicolegal Digest* was presented verbally before the State Society at the 1931 Annual Session and at other times before meetings of nearly every county and district society, and finally has been reprinted in a small pamphlet and is being mailed to each member with his 1932 member

(Continued from page 511—adv. xix)

ship card at the time he pays his annual dues. The Committee on Medical Defense has said that hereafter no member may logically argue that he does not understand the plan.

"Yet one more repetition of an extremely important point may be helpful. Do not wait until sued before you notify the Committee and your insurance company. Notify them immediately upon the slightest threat of a suit.

"Although it may at first seem to be a queer attitude to take, the Committee frowns upon our members taking part in the prosecution of malpractice claims against medical cultists. The reason is plain upon a little careful thought. Those who look upon a malpractice suit as the road to easy money consider that all 'doctors' are alike. If newspapers print stories of successful suits against osteopaths or chiropractors, there is an immediate increase in the number of suits and threats against regulars."

THE INDIGENT IN MISSISSIPPI

The Mississippi section of the March number of the *New Orleans Medical and Surgical Journal* contains the following comments on the care of the indigent, by Dr. G. S. Bryan, County Editor of Monroe County:

"Your card asking for news items has just reached me. . . . My communication will, perforce of scarcity of interesting news, be short this time. None of our doctors have been sick, none have married or been divorced, no youngsters have come to claim parental care at their hands. None of our group have gone to the Bermudas, Florida or California. Nor have they gone to Lake Placid for the winter sports. So you see life with us is rather drab and unexciting. The only thing we are concerned about is the recent move on Mr. Hoover's part to discover the cache in which our part of the one billion, three hundred million is so snugly resting. We had fondly hoped that it might not become necessary to loose this money that we have been hoarding, but, of course, we must 'do our duty though the heavens fall.'

"Replying to your inquiry as to my opinion as to whether legislation is necessary as touching doctors and their work, I will say that I hesitate to go on record further than to say conditions, as they now are, do not meet the requirements. Indigent sick in the part of the state with which I am familiar, get a poor break and the overburdened doctor bears the brunt of what help these poor unfortunates get. It is impossible to get them transported to

(Continued from page 512—adv. xx)

hospitals where needed care can be given them. Those whose condition will permit a long trip usually object to leaving their friends to go among entire strangers. And we can not deny or dodge the fact that entire strangers can not be expected to give them the care and attention they so much need. The home doctor is better able because of personal touch and faith to treat these unfortunate people, if he could only have hospital facilities at his command, than is the doctor in charge of the wards of the large charity hospital. And no doctor that I know will refuse the free service that these people must have (if they get any service at all). Politics, either state or local, should not enter into the solution of these weighty problems. The only question that I am willing to consider is that of money. What can we afford? And how can the best be done? I prefer to leave these questions to the men elected to work out all such matters. Just what laws to pass or what bills to propose I am willing to leave to the committee that represents our association.

"These are indeed gloomy and troublous times, but let us be patient and learn to 'labor and to wait.'"

COUNTY SOCIETY ACTIVITIES IN MICHIGAN

The March number of the *Journal of the Michigan State Medical Society* has an editorial enumerating the following activities which have been assigned to the County Societies by the House of Delegates of the State Society:

"1. The creation of a Public Relations Committee that shall solve and adjust local economic problems.

"2. The appointment of a local medico-legal advisor who shall cooperate with the medico-legal committee.

"3. Devising a county plan for the care of indigents.

"4. Securing as members every eligible physician in your county.

"5. Appointment of a legislative committee that will maintain intimate contact with your legislative representatives.

"6. Organization of a Woman's Auxiliary.

"7. Conducting Public Health Educational meetings.

"8. Apply the recommendation of our State committees on Civic and Industrial Relations, Cancer, and Survey of Medical Agencies.

"If every County Society undertakes to institute these activities, 1932 will be a year of commendable organizational achievements. Presidents and secretaries are urged to present these duties to their society and guide their institution."

Puretest Mineral Oil

absorbs these

and thus relieves

HEADACHE	}	THE CONDITION
LASSITUDE		KNOWN AS
DEPRESSION		"AUTO-INTOXICATION"

You expect a mineral oil to be an effective lubricant whose action you usually much prefer to that of drastic purgatives.

But Puretest Mineral Oil does more than soften and lubricate. It also acts as an agent for the absorption of intestinal toxins. Tests show Puretest to have properties highly absorbent of these poisons.

Puretest Mineral Oil is of uniformly high viscosity and specific gravity (.885 to .895 at 25° C). It is entirely anthracene-free.

For long-standing cases of constipation, specify Puretest Mineral Oil. It is obtainable at all Rexall or Liggett Drug Stores. We will gladly send you samples for testing.

PHENO-COSAN promptly
relieves skin troubles

PHENO-COSAN was primarily formulated for the treatment of eczema. In this condition, clinical reports show consistent success.

In addition, physicians report gratifying results in Tinea, Tinea Phytosis and Impetigo Contagioso.

PHENO-COSAN has a vanishing base and requires no bandages. Contains *no mercury* and is of special value in infant cases.

It is regularly supplied to U. S. Government, State and Civic hospitals.

FREE CLINICS IN MISSOURI

The subject of free clinics is discussed in the March issue of the Journal of the Missouri Medical Association, as follows:

"For the last several months the economics survey committee of the St. Louis Medical Society has been investigating clinic abuse in St. Louis. The study included personal conferences with those in charge of the administration of clinics; with physicians doing work in dispensaries and social service departments; examination of systems employed in the clinics with special reference to determining the eligibility of those admitted for treatment, and a questionnaire survey of members.

"One hundred eighty-one, or 15 per cent, of the membership of the Society responded to inquiries either by questionnaire or by personal conference. It was found that one hundred of the 181 are engaged in dispensary work and that 88 of them reported a total of 560 hours per week devoted to hospital free service work. Seventy-eight estimated the value of the gratis dispensary work, based on fees in regular practice, as totalling \$342,202. On hundred twelve physicians estimated the value of charity work in their private practice for the year 1930 as totalling \$240,280, or an average of \$2,145 for each physician. On this basis the amount of charity work performed by the total membership of the Society would amount to \$2,456,325.

"The committee endeavored to determine whether this amount of charity was justified. Sixty-five per cent of the physicians estimated that 21 per cent of patients who receive free care are able to pay a private physician; thirty-five per cent varied in their replies from 'a great many' to 'a number could pay a small amount.'

"Replies to the questionnaire indicated that 85 per cent of the physicians did not participate in any investigation of the patient's ability to pay and that 73 per cent believed the methods used to determine the patient's financial condition were inadequate.

"The average of all replies by physicians doing dispensary work indicated that 40 per cent of those admitted to all clinics apply for treatment at more than one clinic. This duplication is fair neither to the public nor to those individuals who subscribe to the support of the dispensaries. It constitutes a waste of money and is most unfair to the members of the profession to require them to give their time and skill under such circumstances, especially as 25 per cent of physicians stated that they had a daily allotment of patients in clinics greater than they can handle."

The Society appointed a committee to secure data on the clinics, and to suggest remedies for the abuses.

NEW YORK STATE JOURNAL of MEDICINE

MEDICAL SOCIETY OF THE STATE OF NEW YORK ANNUAL REPORTS, 1931-1932

The first installment of the annual reports was printed in the Journal (1 April 15, 1932—that of the Council, page 45)—and those of the Committee on Economics the Committee on Public Health and Medical Education and the Committee on Public Relations, beginning on page 474. The personnel of the Reference Committees appeared on page 501.

REPORT OF THE PRESIDENT

*To the House of Delegates
Gentlemen:*

The year just passed has been one notable for cooperation and understanding in our Medical Society. The solution of our own internal problems has left us free to formulate a constructive program for ourselves and to give aid in solving the general problems of health and welfare of a public nature. First, consideration will be given to our own program.

The work of the Society, of great volume and complexity, is done by standing and special committees, meeting at frequent intervals during the year. The industry and grasp of detail by the chairmen and members of these committees have been a constant source of wonder and admiration. Their reports can only hint at their scope. The business of the Society is safe in their hands. At least ninety-five per cent of the members of the Society are most interested in the work of actually caring for sick people, and though this portion may not be the most articulate it is the portion on which depends the present and future of medicine and the one to which the Medical Society owes most. Its members realize the need for continual re-education and appreciate the work of post graduate education in their behalf, and the high standard of articles in the Journal. They realize that if they are good enough doctors, the economic troubles and threats from the cults will automatically disappear. The addition to the item in the budget for our very efficient committee on scientific work was wise and should be increased. Doctors attend medical meetings in direct ratio to the value of the scientific program.

The external relations of our Society are more complex and for a variety of reasons. First, we are solicited by a wide variety of charitable and

quasi charitable organizations for our aid or recognition as allies in the furthering of their aims. Large sums are spent by some of these organizations for what has come to be known as propaganda and the penetration of the ranks of our members. If we are to have dealings with some of these organizations, the advice of Cassius may well be kept in mind.

"Well, Brutus, thou art noble, yet I see
Thy honorable metal may be wrought, from that
it is disposed,
Therefore 'tis meet that noble minds keep ever
with their likes,
For who so firm, that cannot be seduced?"

The intrinsic weakness of some of the programs of the professional charity workers must be apparent to themselves or they would not think it necessary to hitch on to so many other up and going organizations to tow them along. And one of the best evidences of the value of medicine, is the number trying with more or less success, to hook on.

The work of the Legislative Committee and Executive Officer has been especially efficient and merits only commendation. Good men are made better by time and training. How the world needs them for its work! The present day tendency toward the increase of governmental machinery has spread to medical societies and is shown in the increasing number of committees and the broadening field of their activities. Curtailment and concentration are worthy of thought.

We are the only profession that has surrendered the training in part of our successors to others, and therein lies a defect. Along with the acquirement of the beginnings of a medical education goes the acquisition of ideals and a reali-

zation of what it is all about. That is constant, while what we call medical knowledge, is forever changing and forever to change.

If we are to have physicians, medical students should be trained by physicians and not by investigators. The medical profession as a whole needs investigators. The people need physicians. Because of mistakes in choosing a life work, there is a certain percentage of men graduated from medical colleges who are not fitted to practice and who will seek positions in which their training will not have been in vain. For such, the rapidly increasing number of government positions will furnish a fertile field of endeavor and if the love of red tape and formalities are not master passions, one will not be led to say, like Earl of Surrey in Henry VIII: "If we live thus tamely, to be thus jaded by a piece of scarlet, farewell nobility!"

A few, taking a broader and more comprehensive view of beneficence will become promoters of charities and the administrators of funds left by wealthy people whose money never purchased health and happiness for themselves; but who vainly hope that it may for others. We need not worry for these administrators and promoters,—“verily, they have their reward.”

A more pernicious effect of the power of wealth on the ideals of medicine is to be noted in the subsidies to medical colleges for propaganda purposes. The antidote for this is the loss of face by institutions so subsidized. The public is very keen as to motives and the present depression seems likely to abate the evil somewhat and for a time.

If it has been shown that some of the ills of medicine follow from faulty adaptation and methods of training, the cure is plain. A return to a real preceptor system will discover who are and who are not fitted, and will eliminate some of the unfit, and prevent the disappointment and humiliation of men who are misfits, and divert them into channels leading to happy and useful lives.

The American Medical Association has by classification and rating reduced the number of medical colleges by more than half. The State Medical Society might wisely pass on the curricula of medical colleges as to their fitness to serve from a point of view other than that of laboratories, hours, museums, libraries, etc. Marble and brick, glass and brass, do not make a medical college.

The problems just touched upon belong properly to the Committee on Medical Education and Public Health. Public Health and Public Relations overlap and the joint meetings of these committees the past year have revealed many points of common interest.

If the practice of public health is to be limited to its proper sphere, the Medical Society of the State of New York should help to define that sphere which is growing rapidly at present.

It may be that Public Health consists in furnishing treatment for private diseases and the management of general hospitals and the determining of who shall practice in such hospitals supported by public funds. This idea is so new that the medical profession has not had time to pass judgment on it as yet. Some adjustment of authority between the Department of Education, which grants a doctor the right to practice medicine and surgery in this State, and another department which says that a surgeon must say good-bye to his patient at the door of a publicly owned and supported hospital, should be made. Why the surgeon, and not the obstetrician, internist, etc., is not plain. I know of no more important problem for the joint study of these committees.

These problems lead to the important one of State aid in general,—of the various ways of acquiring other people's property to do with as you wish. No definition of State aid has been given which consists in taking another's property with his knowledge and increasingly grudging consent and returning to him the part not used up in the machinery of collection and distribution.

The people as a whole have suddenly become tax-conscious and are going to watch their tax money through to its final use. The increasing tax confiscations and tax sales of homes point to a time when a citizen can say to his Government:

“You take my life when you do take the means whereby I live!”

The ability of men to govern themselves is being tested by us here and now. We will have freedom only if we are worthy, and it behooves us, the descendants of that first medical man who first had the leisure to think, to give the best that is in us “that this nation shall not perish from off the earth.”

WILLIAM D. JOHNSON, *President.*

April 15, 1932.

REPORT OF THE SECRETARY

To the House of Delegates:

Gentlemen:

Your Secretary has the honor of presenting his seventh annual report.

As the years have rolled on the executive work has steadily increased and the office bids fair to become, in the not-distant future, a "full-time job."

THE SOCIETY

Despite the business depression, the unnecessary worry over predictions of State medicine, the encroachment of hospitals and dispensaries and the actual loss of practice which prevails, the Medical Society of the State of New York has made a decided gain in membership and in income and has continued its earnest enthusiastic work for the welfare of organized medicine with unabated fervor.

The officers and committee men have willingly and loyally given their time and best endeavors to advance the interests of the Society and of the individual members. Their intelligent thoughtful study of the problems which constantly confront us and the constructive ideas with which they built their work have done much to engender a feeling of optimism throughout the Society and to dispel the pessimistic feeling of "whats the use" and "what can we do."

It is only when we come to consider that these men are in the main practitioners of medicine whose living depends upon their professional work that we can understand and appreciate this loyalty and devotion.

As has been pointed out in a previous report even in this good work there are pitfalls to be avoided. Over-enthusiasm and individualism are probably the most serious ones. It must always be borne in mind that a central governing power is an absolute necessity and that the individualist soon loses necessary contact with his fellows and thus becomes devoid of influence.

THE SOCIETY'S OFFICE

The general offices of the Society could be improved by the addition of a room where meetings could be held without interfering with the business of the Society. With the building of the addition to the Academy building, a room of this character could be obtained in the early fall and the Secretary earnestly recommends to the Trustees the obtaining of such quarters. At present when committee meetings or conferences are held in the Society's rooms the office force has to cease work and in some instances has to be relieved from duty part of the day. This is not conducive to the proper conduct of business nor to the peace of mind of the Secretary.

There have been no changes in the personnel of the office force during the year and the Secre-

tary takes pleasure in again stating that a more cheerful, willing and efficient staff does not exist.

To them and to Miss Baldwin the Secretary extends his sincere thanks.

FINANCIAL DEPARTMENT

In these days when the general topic of conversation is the fall in value of securities and the lack of dividends, it is indeed gratifying to read the reports of the Treasurer and the Board of Trustees and realize that they have been actuated by safe and sane policies.

The Society is to be congratulated upon having such men in charge of its finances.

LEGAL DEPARTMENT

During the past year, Mr. Lorenz J. Brosnan has continued his excellent work and has proven himself in every way as a friend, counsellor and lawyer worthy of the confidence which the Society has reposed in him.

Not only have letters of commendation been received from those whom he has defended but favorable comments on his work have been made by lawyers who have opposed him.

COMMITTEES

Mention has already been made of the excellent work done by the committees and your Secretary feels that he can voice the appreciative thanks of the Society. He does this advisedly and from personal experience as from time to time he has sat with many of the committees.

The Secretary, however, wishes to offer constructive criticism and a recommendation. Great care should be exercised by the House of Delegates in the creating of special committees. In several instances such committees have been created without considering the relative expenditure of time and money and the worth of work supposed to be accomplished. The records show that many of these committees have never met.

The Secretary recommends that the Special Committee on Periodic Health Examination and the Special Committee on Physical Therapy be abolished and their work made part of that of the Committee on Public Health and Medical Education. The Chairmen of both of these committees have been consulted and deem this a wise move. There may perhaps be other committees that could be combined under a single appropriation without affecting their efficiency.

It is recommended that the incoming Executive Committee make a study of such matters.

In his last report your Secretary recommended the appointment of a committee to revise the Constitution and By-laws which recommendation was adopted and the committee appointed. This committee has given individually and collectively conscientious study and careful attention to the

details of this revision and the Secretary of the Committee will present it to the House.

As your Secretary was a member of this committee, it would not be becoming for him to make any comment further than to praise the work done by the other members of the Committee and to recommend it to the favorable consideration of the House.

DISTRICT BRANCHES AND CONFERENCES

Continuing the long-established custom of attending the District Branch Meetings your Secretary visited six of the Districts but owing to the exigencies of practice regretfully found himself unable to attend the other two. He was gratified to find the same earnest interest manifested by the members and the scientific programs of the highest order.

The attendance on these Branch Meetings has steadily increased during the past few years due probably to the business-like method which has been adopted for their government. The former haphazard organization is a thing of the past. The selection of officers has been done with an eye to the welfare of the district and meetings of the Executive Committees have been held regularly.

One excellent feature of each meeting has been a short address by the Chairman of the Insurance Committee, Dr. John A. Card and it is recommended that Dr. Card be authorized to continue these talks.

The Conference of the County Secretaries was well attended and the discussion showed that the secretaries had a much better grasp and a keener understanding of the general affairs of the Society than before the custom prevailed.

On account of the benefit derived by the secretaries and incidentally by the county societies, it is recommended that these conferences be continued.

The Conference of the State Secretaries and Editors held under the auspices of the American Medical Association in Chicago was attended by the Editor-in-chief, the Executive Editor and the Secretary all of whom took active part in the various discussions.

The Secretary also attended the Tristate Conference held in New York City.

LEGISLATION

It may be claimed that this subject has no place in the Secretary's report but such claim cannot be made by those who recognize the extreme importance of a close relationship between the Secretary's office and the Legislative Bureau.

These have been parlous times filled with extremely critical moments and it has been only through the intelligent direction of the Chairman of the Legislative Committee and the able handling of complicated situations by the Executive Officer that the Society was able to pull through

the session unscathed by any pernicious or obnoxious acts of legislation.

To Dr. Lawrence is due the fact that every measure affecting the profession unfavorably or expressing views on matters of public health adverse to those held by the Society were defeated. As an example of his excellent work attention is called to the failure of the osteopathic bill which had such strong backing as that of the Board of Regents.

SPECIAL MEETING OF THE HOUSE OF DELEGATES

Pursuant to the decision of the Council, a special meeting of the House of Delegates was convened in the Hotel Ten Eyck, Albany at 2 P.M., Thursday, January 14th, for the purpose of considering the report of the Joint Committee on the report of the Governor's Special Health Commission.

After free and full discussion the report of the Joint Committee was adopted.

* The delinquents are paying daily. 122 have already been reinstated, which makes the number of dropped members practically the same as last year with an increased membership of 450.

The list of honor counties is as follows: Albany, Cayuga, Chenango, Columbia, Greene, Lewis, Orleans, Rockland, Schoharie, Schuyler, Tompkins and Washington.

The Secretary extends his thanks to the Executive Officer for his ever-ready support and willing co-operation; to the Councillors for their courtesy and hospitality at the District Meetings and to the President, the members of the Executive Committee and other officers whose encouragement and friendship have lightened his burden and made his work a pleasure.

Respectfully submitted,

DANIEL S. DOUGHERTY,
April 15, 1932. Secretary.

REPORT OF COUNCIL

To The House of Delegates

Gentlemen

The Council has the honor of presenting the following annual report which includes those of its Executive Committee, Committee on Publication and Committee on Insurance.

In accordance with Chapter IV of the By laws the Council convened in the Syracuse Hotel, Syracuse, June 2, 1931, for the purpose of organizing for the ensuing year.

Pursuant to the provisions of the By law governing the constitution of the Executive Committee, the following members of the Council, nominated by the President, were elected to serve with the officers therein specified as said Executive Committee, John A. Card, Arthur J. Bedell, Louis A. Van Kleeck, Augustus B. Smyth and W. Ross Thomson.

The appointment of members of the standing committees was referred to the Executive Committee.

A regular meeting was held at the State Society's rooms, New York City, Thursday, December 10, 1931.

The most important business transacted at this meeting was as follows:

The confirmation of the appointment by the President of a committee of five to meet with a similar committee from the New York State Society of Industrial Medicine for the study of problems arising from Workmen's Compensation.

The adoption of the following resolution:

"RESOLVED, THAT the principles governing publicity adopted by the Press Publicity Committee and published in the NEW YORK STATE JOURNAL OF MEDICINE of December 1, 1931 shall be binding upon every member of the Medical Society of the State of New York, and be it also

"RESOLVED, THAT any member of the Medical Society of the State of New York who knowingly violates those principles or who is guilty of a violation of them after warning by competent authority shall be subject to investigation by the Censors of his county medical society and be subject to such discipline as the Comitia Minora of the county society may determine."

It was decided to refer the report of the Joint Committee to consider the report of the Governor's Special Health Commission when completed, to a special meeting of the House of Delegates and the President, Speaker and Secretary were appointed a committee to determine the place and date. This committee met immediately and reported the selection of Albany on January 11, 1932.

The Society having been notified that in the re-appointment of members of the House of Delegates of the American Medical Association, it was entitled to an increase of two delegates and the Legal Counsel having given the opinion that the Council had the power to elect such delegates, Drs. Frederic E. Sondern and Edward R. Cumiffe were placed in nomination and duly elected to serve during 1932.

In accordance with Section 1265 of the Education Law, Drs. Frederick H. Flaherty and Austin G. Morris were nominated to fill the vacancies on the Grievance Committee occurring on December 31, 1931. To fully comply with the law four other names were also submitted.

Executive Committee

The Executive Committee has held regular meetings on the second Thursday of each month, at the first of which it organized by electing William D. Johnson Chairman, and John A. Card, Vice Chairman. At this meeting, Orrin Sage Wightman was appointed Editor in chief, Frank Overton, Executive Editor, Lorenz J. Brosnan, Legal Counsel and Thomas H. Clearwater, Attorney, also as Publication Committee, Charles H. Goodrich, Daniel S. Dougherty and Charles Gordon Heyd, as Committee on Budget, the Speaker, the Secretary and the Treasurer and as Committee on Insurance John A. Card, Charles Gordon Heyd and Frederic E. Sondern.

Much of the business transacted during the year has been necessarily of a routine character, the Committee acting as Council ad interim being essentially the business and administrative body of the Society.

Although the work of the Executive Committee is routine, it is extremely important and the Committee has at all times given it serious consideration.

As a detailed report would be unnecessary waste of time and space only the more important decisions and actions can be mentioned.

Under date of June 18th the annual budget submitted by the Budget Committee was approved and ordered submitted to the Trustees.

The renewal of the contract with the Executive Officer was approved and referred to the Trustees.

The following nominations of committee men were made by the President and endorsed by the Committee:

Scientific Work—George W. Kosmak

Public Health and Medical Education—George W. Kosmak, Mahlon H. Atkinson, Leo F. Schiff, William A. Groat, Martin B. Tucker, Clayton W. Greene, Edward G. Whipple and Nellis B. Foster.

Legislation—John J. Buettner and Marshall Clinton.

Arrangements—L. Edward Villiaume, Nelson G. Russell, Robert P. Dobbie, Clarence H. Mackey, Milton G. Potter, William F. Jacobs, Frank N. Potts and James E. King.

Medical Economics—Frederic E. Elliott, Morris Rosenthal, Donald S. Childs and Joseph P. Garen.

Public Relations—Oliver W. H. Mitchell, Augustus J. Hambrook, George M. Fisher and William H. Ross.

Medical Research—Augustus B. Wadsworth, Burton T. Simpson, Simon Flexner, Winfield W. Scott, Edwin MacD. Stanton and Frederic E. Sondern.

Physical Therapy—Richard Kovacs, Chairman, Philip L. Forster, Guy H. Turrell, Frederic E. Elliott, Lee A. Hadley, George A. Leitner and Virginia Tannenbaum.

Periodic Health Examination—C. Ward Crampton, Chairman, Walter D. Ludlum, Walter A. Calihan, Guy H. Turrell, Harlow Brooks, Luther F. Warren, Nelson G. Russell, Joseph D. Olin, Marion C. Potter and W. Worthington Herrick.

Nurse Problem—Nathan B. Van Etten, Chairman, Andrew Sloan, J. Richard Kevin, George W. Kosmak, George R. Critchlow, Arthur S. Chittenden, George L. Brodhead and Robert P. Munson.

Prize Essays—Edwin MacD. Stanton, Chairman, Edgar A. Vander Veer and Albert C. Snell.

Insurance—John A. Card, Chairman, Charles Gordon Heyd and Frederic E. Sondern.

Press Publicity—Samuel J. Kopetzky, Chairman, Edward C. Podvin, Alec N. Thomson, Carl Boettiger, James N. Vander Veer, Arthur J. Bedell, Edwin Mac D. Stanton, Leo F. Schiff, Hyzer W. Jones, Lynn B. Chase, Charles D. Ver Nooy, Arthur S. Chittenden, Walter A. Calihan, John R. Williams, Louise Beamis and Peter J. Di Natale.

Under date of September 10th, the appointment of Drs. C. Hendee Smith, Walter D. Ludlum, John A. Card, Henry L. K. Shaw, Wardner D. Ayer, Stanhope Bayne-Jones and Clayton W. Greene to serve as members of a sub-committee to work with the State Department of Health during the poliomyelitis epidemic was confirmed.

Dr. Edward E. Haley was appointed to act as Secretary of the Committee on the Revision of the Constitution and By-Laws and Dr. Herbert A. Smith of Buffalo was appointed Chairman of the Committee on Arrangements.

It was decided that the next Annual Meeting be held in Buffalo, May 23, 24, and 25, 1932.

On October 8th, Drs. John A. Card, Charles Gordon Heyd and Frederic E. Sondern were ap-

pointed a committee to cooperate with the Saratoga Springs Commission.

Under date of January 14th, 1932, Dr. George W. Kosmak was appointed to represent the State Society at the hearings on bills pending in Congress to provide federal subsidies for rural maternal and infant hygiene.

Drs. Nathan B. Van Etten, George L. Brodhead and Andrew Sloan were nominated for membership on the Nurse Advisory Council.

The President announced the appointment, in accordance with a resolution of the Council, of Drs. Charles H. Goodrich, Thomas H. Cunningham, George Chandler, Ross G. Loop, Homer Knickerbocker and Sherman M. Burns to meet with a similar committee for the New York State Society of Industrial Medicine to discuss the problems arising from workmen's compensation.

Under date of February 11, 1932, Dr. Peter Irving was appointed a committee to confer with the Joint Committee of the Dental and Medical Professions regarding the advisability of holding a joint conference under the auspices of the Medical Society of the State of New York.

Drs. John A. Card and Arthur W. Booth were appointed a Committee on Transportation to the meeting of the American Medical Association in New Orleans.

At this meeting several resolutions regarding legislation were passed, the most important of which was to the effect that the Society is absolutely opposed to any osteopath bill containing a waiver whereby the safety of public health and welfare might be endangered by allowing the use of surgical instruments and the prescribing and administration of drugs by those untrained and unskilled.

Under date of March 10, 1932, the Insurance Committee were instructed to prepare an article for the State Journal on Mr. Lloyd Paul Stryker's book, "Courts and Doctors."

Pursuant to a resolution that the President be empowered to appoint a committee to study the publication of the Journal and Directory with power to ask such assistance as they may deem necessary and report back to the Executive Committee, the President appointed Drs. John A. Card, Daniel S. Dougherty and Frederic E. Sondern.

Owing to the ruling that all inquiries and requests for opinion sent to the Counsel by county societies or individual members should be presented to the Executive Committee before reply, considerable time was given at each meeting to the discussion of these problems.

During the year the committee remitted the dues of several members unable to practice on account of long continued illness.

Insurance Committee

Although this Committee held several meetings and conferences, no important issues have arisen and no new policy has been adopted.

All correspondence relating to insurance problems was referred to them and handled in a commendable manner.

Publication Committee

This Committee has met in conference with the Editors whenever occasion demanded and the publication work of the Society has proceeded harmoniously.

It is recorded with gratification that although it was necessary to publish a larger edition of the Directory owing to the steady increase in membership and in spite of the inclusion of the Constitution and By-Laws and the Principles of Professional Conduct, the total expense of the Directory for this year is only a small amount in excess of last year and would have shown a decrease if it had not been for a considerable loss in the revenue received from advertisements and sales.

The report of the Journal written for the Committee by the Executive Editor is here presented.

The Journal

The NEW YORK STATE JOURNAL OF MEDICINE has maintained its usual balance in the size of its several departments, as will be seen in the following table showing their number of pages during the past three years.

	1929	1930	1931
Scientific	639	537	573
Editorial	73	74	73
Medical Progress	96	96	96
Legal	68	62	70
News	207	220	272
Our Neighbors	127	137	153
Daily Press	48	48	48
Book Reviews	48	46	44
Advertising	653	615	633

The Journal has been conducted in accordance with the policy of the Executive Committee that the Journal shall fully reflect the activities of the Medical Society of the State of New York and its constituent county societies, and also shall report the activities of other State Societies as

revealed in their own Journals. Approximately one third of the Journal is devoted to these activities. The items are chosen for their importance and timely news, and every effort has been made to publish them promptly while they are "live" news.

The amount of space given to news items is considerably greater than that in any other year. The reason for the increase is the fact that the Societies are doing more work than ever before.

The county medical societies have shown a gratifying response to the request of the House of Delegates that each one shall appoint a representative to report the meetings to the State Journal. (Journal, July 1, 1931, page 825.)

The standard of the Journal in the choice of news items on public activities is that they shall have a permanent value, worthy of perpetuating in an index. Great efforts have been made to index all the items so that they may be available for easy reference. Four forms of index have been used.

1. An annual index of society activities. That of 1931 fills seven pages.

2. A quarterly index for current use and convenience.

3. Cross references to previous activities.

4. Special indexes of activities extending over months or years,—as for example, the index to the Governor's Health Commission, published in the Journal of October 1, 1931, page 1200.

Our Journal has been a pioneer in specializing in the publication of medical society activities, and its index of these activities is practically the only one in existence.

Special efforts have been put forth to make the articles in the scientific department useful to general practitioners who constitute the great majority of the members of the State Society. Authors and contributors are to be commended for their attitude of cooperation with the editors.

Advertisers continue a friendly attitude toward the Journal as is shown by the fact that the receipts from advertising in 1931, the year of financial depression, have been almost as great as those of 1929, the year of prosperity.

Respectfully submitted,

D S DOUGHERTY,
Secretary

THE REPORT OF THE BOARD OF TRUSTEES

To the House of Delegates,
Gentlemen:

It is unnecessary to recall to you the profound losses that have occurred in the value of securities in the world's markets in the past year. The average percentage loss of all domestic bonds listed on the New York Stock Exchange has been approximately fifty-two (52%) per cent as of March 31st, 1932.

It is indeed gratifying, then, to be able to report that the percentage loss on the bonds held as investments by this Society has been as of the same date only 26.8%. This fact is a tacit testimony to the care and capacity of the Investment Committee of this Board and their financial endeavors.

Your Board has invested an additional Ten (\$10,000) Thousand Dollars during the past year accrued from interest on investments, making a total investment at cost figures of \$126,394.01, all in bonds, a majority of which are legal for savings banks and trust funds according to the law of the State of New York. There has been no default in interest payment on our investments within the past year.

Our financial condition at the conclusion of this administrative year may then be said to be satisfactory taking into consideration all adverse factors as is shown by the tabulated investment summary appended to this Report.

The Society has been very fortunate for many years in having secured the services of Treasurers of great financial acumen, continuity of purpose and devotion to the affairs of the Society. It is not too much to say that the present incumbent has for the many previous years of zealous service to the profession and to the Society in other capacities shown his outstanding ability; in his present office his great financial knowledge,

foresight and judgment have been exceeded by none and equaled by few.

Your Board has endeavored to the best of its ability to carry out the directions of the House of Delegates and its subordinate bodies, the Council and the Executive Committee, with a due regard to the financial integrity and preservation of the funds of the Society for unproductive expenditures. In the performance of this duty inevitable differences of opinion arise between our Officers, Chairmen of Committees and this Board, which we have endeavored to adjust with due regard for the duties placed upon us by the Constitution and By-Laws.

It is earnestly recommended to the House and through it to the Council and the Executive Committee that in all of its proposals involving the expenditure of funds for the ensuing year most careful consideration be given to an appraisal of the value to be obtained by the proposed measure against the actual possible expenditure for carrying it into effect. It seems to the Board that the present time is one to consider the expenditure of funds for the most urgent purposes only and for the most careful conservation of invested moneys.

The Board wishes to express its commendation and heartfelt thanks to the Treasurer, Dr. Fred-
eric E. Sondern, and to the Secretary, Dr. Daniel
S. Dougherty. Without the Manager, Miss Bald-
win, the Society would be very like a ship with-
out a quartermaster.

Respectfully submitted,
JAMES F. ROONEY, *Chairman*,
ARTHUR W. BOOTH,
NATHAN B. VAN ETEN,
GRANT C. MADILL,
HARRY R. TRICK.

REPORTS COMMITTEES ON SCIENTIFIC WORK AND LEGISLATION

To the House of Delegates:

Gentlemen:

Your Committee on Scientific Work presents the results of its long and arduous deliberations in the form of an attractive, stimulating and educational program.

This year we have correlated the three great divisions of medical instruction.

1. *A Clinical Day* has been arranged by the local Buffalo Committee. By permission of the Council this innovation is inaugurated. Experience has proven that clinical sessions provide the most easily assimilated form of medical food. The supply of mental exhilaration and nourishment will be unlimited. All branches of medicine will be represented and we are convinced that every one who attends these clinics will be amply repaid. The work of our Buffalo confrères will be placed before us by means of operations and discussions. This Clinical Day is Monday, May 23rd. The details of the program will be posted so that every member can select the part which appeals to him.

2. *Scientific Exhibit.* This exhibit will be on display in the foyer of the Hotel Statler from Monday morning, May 23rd, until Wednesday night, May 25th. Competent demonstrators will explain a great variety of interesting things. The list of exhibitors appears in the program.

3. *Scientific Assembly.* The Sessions of the Society are divided into two groups, General and Special.

General Sessions will be held in the ballroom of the Hotel Statler at two o'clock, Tuesday and Wednesday.

The Tuesday meeting will be opened with an address by Dr. E. Starr Judd, President of the American Medical Association. The remaining part of the afternoon will be devoted to a Symposium on "The Therapeutic Use of Biological Products" presented by unusually well qualified leaders who will relate their personal experiences and summarize their beliefs.

Wednesday afternoon Session will be a "Therapeutic Symposium." This will be a unique experiment, clinicians of wide experience will tell how they treat certain diseases.

On Tuesday and Wednesday mornings the separate Sections will meet for the study of their special problems. The programs reflect the serious endeavor of the separate chairmen to secure trained speakers.

A new *Session on Radiology* is started this year under the very competent supervision of Dr. Joseph M. Steiner.

Your chairman takes great pleasure in expressing his indebtedness to all the members of the committee for their efficient cooperation, their suggestions and their unfailing courtesy and to all who have assisted in the preparation of exhibits and planned the clinics.

Respectfully submitted,

ARTHUR J. BEDELL, *Chairman.*

April 15, 1932.

REPORT OF THE COMMITTEE ON LEGISLATION

To the House of Delegates:

Gentlemen:

It gives us great pleasure to report to you that the year 1931-1932 has been one of the banner years in the history of the Committee on Legislation. Beginning with imminent and open threats from the osteopaths, physiotherapists and chiropractors, we were successful in defeating the osteopath and physiotherapy bills and creating an atmosphere which made chiropractors decide not to introduce their bill. This result was made possible by the unprecedented, wholehearted, co-operation of the members of County Medical Societies through their legislative chairmen. For this the Chairman of the Committee on Legislation extends his sincere thanks.

The osteopaths of the State of New York have promised to have their schools require two years premedical college work after 1935, in return for the support of the Department of Education of the State of New York, of the present osteopathic

bill in the Legislature. After considerable discussion the Department of Education agreed to this arrangement. An effort was made to have the Medical Society of the State of New York concur in this agreement. Since the osteopathic bill was absolutely sure of passage anyway, it was the best that the State Medical Society could do under the circumstances. The officers of our Society and the members of the Committee on Legislation, at an informal conference with the Department of Education, decided that the Medical Society of the State of New York was pledged to uphold the principle of a minimum standard of education for all medical practitioners, and one cannot compromise with a principle.

The fact that the osteopathic bill was defeated this year should convince the members of the medical profession that the State Legislature will always support them in upholding the high standard of medical education if only the doctors would let their wishes be known to their legislators clearly and emphatically.

The constant threat of the anti-vivisectionists must be taken seriously by every one who is interested in the advance of medical science. The movement is dangerous for two main reasons.

1. It is supported by a permanent endowment fund. As long as the fund lasts, there will be a group who will be interested in keeping the movement alive.

2. It is symbolized by a high ideal (prevention of cruelty). We know that the ideal is false and has no foundation in fact, but we must realize that many of the supporters are sincere and are motivated by a high sentiment. Individuals and nations have sacrificed "their all" for less plausible ideals (*war to end war*).

Most, if not all the advances that have been made in public health, sanitation and hygiene have been made possible through animal experimentation. The public should be aroused to the importance of this work for its own welfare. The interest of this work to the medical profession is purely scientific. Its interest to the public is vital. The medical profession must no longer carry on this fight single-handed. It is not fair to us, and we are likely to be worn down and defeated by this fanatic group.

Recommendation: Every County Medical Society, Academy of Medicine, and other scientific group should appoint an influential committee

whose purpose it shall be to interest and *organize* the leading citizens of their community for the protection of the public against these senseless fanatics, bigots and quacks who are forever threatening to undo all that has been accomplished in public health, sanitation and hygiene.

A résumé of the 1932 legislation by Dr. Lawrence has been published in the April first issue of the NEW YORK STATE JOURNAL OF MEDICINE, page 412, and I will not bore you by repetition.

The Committee on Legislation desires to emphasize the following conclusions:

1. The Legislature of the State of New York will always support the medical profession in upholding the high standard of medical education, if physicians will let their wishes be known, clearly and emphatically, to their individual legislators.

2. The medical profession must no longer carry on the fight of the public single-handed, but must arouse and organize the leading citizens in all communities for the support of medical ideals.

With grateful thanks to the members of the Committee on Legislation and the members of the County Committees, and all our friends throughout the State for their hearty cooperation, this report is respectfully submitted.

HARRY ARANOW, *Chairman*.

April 15, 1932.

REPORT OF THE COMMITTEE ON MEDICAL RESEARCH

To the House of Delegates:
Gentlemen:

In behalf of your Committee on Medical Research I have the honor to present the following report:

During the year, your committee was actively engaged in opposing the efforts of the anti-vivisectionists to secure the passage of a law by the New York State Legislature to prohibit the use of living dogs in properly conducted experiments and investigations in medical schools and universities of the State. While the Legislature was in session, the same bill was introduced three times, and the antivivisectionists maintained a persistent lobby in its favor until the last days of the session.

The first bill was introduced into the Assembly by Mr. Vaughan. In presenting opposition to this bill, your committee was ably supported by physicians and other influential citizens, by institutions engaged in medical research and teaching, by county medical societies, by the New York State Association of Public Health Laboratories, and by the Veterinary Medical Society of the State of New York. A hearing on the Vaughan Bill was held before the Committee on

Codes in the Assembly on February 9th. Members of the committee and a number of supporters of the opposition to the Vaughan Bill appeared at the hearing. Those who presented the arguments against the bill were; Dr. Simon Flexner, Director of the Rockefeller Institute for Medical Research; Dr. Peyton Rous, Member of the Rockefeller Institute for Medical Research and representative of the New York Academy of Medicine; Dr. Florence R. Sabin, Member of the Rockefeller Institute for Medical Research and Member of the National Academy of Science; Dr. Thomas Parran, Jr., Commissioner of Health of New York State; Dr. George H. Whipple, Professor of Pathology and Dean University of Rochester, School of Medicine and Dentistry; Dr. G. Canby Robinson, Director, New York Hospital-Cornell Medical College Association; Dr. John Wyckoff, Professor of Medicine, New York University and Bellevue Hospital Medical College; Dr. John J. Morton, Professor of Surgery, University of Rochester, School of Medicine and Dentistry; and Dr. Walter L. Mattick, New York State Institute for the Study of Malignant Diseases.

Shortly after the hearing on the Vaughan Bill,

an identical bill was introduced into the Assembly by Mr. Bernhardt. No hearing was held on this bill.

The Committee on Codes in the Assembly voted against both of these bills.

The third bill, with the same wording as the Vaughan and Bernhardt bills, was introduced into the Senate by Mr. Wicks. No action was taken on the Wicks Bill until near the close of the session. A vote was then asked for in the Committee on Codes in the Senate. We were informed that there were not enough votes to secure release of the bill from this committee.

Your chairman wishes to call attention to the services rendered the State Medical Society,

medical institutions, and the cause of medical progress and human and animal welfare by the Legislators who were convinced that the Vaughan, Bernhardt, and Wicks bills were detrimental to these interests. They maintained their stand against an unusually active general and political agitation carried on by the antivivisectionists.

The New York Academy of Medicine and the Committee on Legislation of the Society gave every possible aid to the work of your committee. Your chairman wishes to thank Dr. Joseph S. Lawrence, Executive Officer of the Society, for his constant and valuable assistance.

Respectfully submitted,
April 15, 1932. S. BAYNE-JONES, *Chairman*.

REPORT OF THE COMMITTEE ON PRESS PUBLICITY

To the House of Delegates:

Gentlemen:

The Press Publicity Committee created by the House of Delegates at the last annual meeting has made considerable progress in its program for the control of medical publicity.

Following the first meeting of the committee on November 10, 1931, sub-committees were formed in every District Branch, with representation from the constituent county societies of the respective districts. These sub-committees supervise radio talks by physicians and articles by medical men appearing in lay periodicals, each sub-committee directing the publicity of doctors in its own district. In some sections the sub-committees are sponsoring or cooperating in regular health education programs.

The committee has taken as the basis of its supervisory action the *Principles of Publicity* which it formulated at the outset of its work and which were published in the NEW YORK STATE JOURNAL OF MEDICINE, with editorial comment, on December, 1, 1931, page 1469. These *Principles* have been reprinted and distributed to newspapers, magazines and radio-broadcasting stations throughout the state for their information and guidance. Many of the larger broadcasting stations have consented to be guided by them in medical broadcasts; and station WNYC has announced to all of the municipal departments of Greater New York that all medical talks must conform to them.

At the suggestion of the committee, the Council passed a resolution making the *Principles of Publicity* binding upon all members of the State Society, so that deliberate violators of them will be subject to discipline by the Board of Censors of their respective county societies. This has been a very helpful provision; although in the majority of cases physicians who have violated the rules, willingly consent to be governed by

them when the regulations in force are brought to their attention.

The second meeting of the committee, on January 14, 1932, brought forth many interesting contributions to the question of the control of medical publicity. The experience of each member in his own district furnished valuable suggestions to the committee as a whole.

The committee has been compelled to restrict the scope of its activities considerably by the failure of the Trustees to adopt the budget which it submitted. It is the ultimate hope of the committee not merely to supervise publicity issued by physicians, but also to sponsor authentic projects for health education and to cooperate with various lay agencies interested in medical and medico-social activities so that the booklets and articles put forth by them may be in accord with the views of the organized medical profession.

Recommendations: It is recommended that the Press Publicity Committee be continued as a Special Committee.

It is recommended that all publicity emanating from officers, committees, and officials of the Medical Society of the State of New York, with the exception of the publicity work of the Committee on Legislation and of the Executive Officer, go through the hands of the Press Publicity Committee.

It is recommended that the Trustees be requested to make budgetary provision for the secretarial and other necessary expenses of the Press Publicity Committee.

The committee desires to thank the editor of the State Journal of Medicine for his willing cooperation; and the Chairman desires to thank the Secretary and other members of the committee for their unstinting work.

Respectfully submitted,
SAMUEL J. KOPETZKY, *Chairman*.
April 15, 1932.

REPORT OF THE COMMITTEE ON PHYSICAL THERAPY

To the House of Delegates:

Gentlemen:

The work of your committee showed gratifying progress during the year, which is the third in its existence.

County Societies. In accordance with the instruction of the House of Delegates, special efforts were made to stimulate more active interest among the county medical societies. The extended use of physical measures having begun only after the present medical generation received their medical training, post-graduate instruction by papers or lecture courses becomes imperative if physical therapy is to be part of the legitimate practice of medicine. The aim of the committee was to make it possible that there be in every county society at least a few men who are familiar with the possibilities and limitations of physical therapy and who will actively carry on the work or direct its institutional use. Your chairman addressed the secretaries meeting in Albany and ten meetings of county societies.

Questionnaires were sent out to all county societies and the active cooperation of the committee was offered along the line of lectures and organization. The result is shown in the accompanying table.

In 1930 there were committees in 18 counties and papers or lecture courses were given in five; while in 1931 there were committees in 30 counties, and papers or lecture courses given in 11. In 9 counties some interest was expressed, while 5 counties stated that there was not enough interest for active work; and 13 counties made no reply. This summary shows that the efforts of the committee met with satisfactory response in more than half of the 60 counties; and the continuance of the committee's work will insure further active interest and the likelihood of response from the rest of the counties.

The chairmen and members of the Physical Therapy Committees of the counties were regularly invited to the stated meetings of the State Committee which were held at Albany, New York, Syracuse, and Clifton Springs. Whenever possible these meetings were combined with a lecture, in order to stimulate more general interest.

In carrying on its educational work, your committee had the fullest cooperation from the chairman of the Committee on Public Health and Medical Education, and wishes to express its gratitude for his active interest and unfailing courtesy.

Hospitals. Following last year's survey of hospital facilities in physical therapy, your committee again offered its service to the hospitals which recorded their intention to install new departments. Due to the general economic situa-

tion, no progress in this direction can be recorded. Your committee urged the chairmen of the Medical Boards of Hospitals possessing physical therapy departments to encourage the presentation of physical therapy cases at staff meetings, in order to stimulate better interest and a more intelligent discussion of the value and limitations of physical measures.

Medical Colleges. The Deans of Medical colleges were again asked for information concerning instruction in physical therapy to graduates and undergraduates. The accompanying table shows very definite progress compared to the table in the annual report of two years ago.

Objectionable Commercial Courses.—Additional efforts were made to discourage commercial lectures run by manufacturers and lecturers from outside of the State. In the single instance where such a self-appointed lecturer attempted to run a set of sales talks of his own, the Bureau

SURVEY OF PHYSICAL THERAPY INSTRUCTION IN MEDICAL COLLEGES OF NEW YORK STATE

1931

	UNDERGRADUATE TEACHING	GRADUATE TEACHING	SPECIAL
Columbia University College of Physicians and Surgeons	3rd year students—8 lectures and demonstrations 4th year students—optional clinical work	Under advisement	3 months' resident service at Presbyterian Hospital
Cornell University Medical College	Casual clinical instruction; therapeutic courses in medicine and surgery.	None	
New York University University and Bellevue Hospital Medical College	None	None	1 year course for (non-medical) physical therapists at Hospital Ruptured and Crippled in New York

University of Rochester School of Medicine	Senior Class—3 hours a week for 4 weeks (Demonstrations)	Physicians admitted to observe clinical work.	

of Investigation of the American Medical Association furnished helpful information as to the true status of this physician.

Session at the Annual Meeting. As in the previous two years, your committee was entrusted by the Committee on Scientific Work to arrange a program for a half day session on physical therapy at the annual meeting of the State Society. These sessions were well attended and proved valuable in spreading further information about the status of physical therapy among general practitioners. The committee wishes to thank Dr. A. J. Bedell, chairman of the Committee on Scientific Work, for his interest.

Compensation Work. In order to develop suitable standards for physical therapy in com-

pensation work, your committee conferred with the Committee on Industrial Clinics of the State Department of Labor, the Industrial Commissioner also being present at this meeting. The possibilities of correcting abuses by some low grade industrial clinics were discussed; a minimum standard for physical therapy equipment was proposed and subsequently endorsed by the Executive Committee.

A special course on physical therapy in traumatic conditions was arranged for the Committee on Medical Education in the Counties of New York and Bronx and the cooperation of the insurance carriers enlisted.

Legislation. Another attempt was made this year to introduce legislation to free registered

physiotherapists from any medical supervision. The intention of the physiotherapy clause in the Medical Practice Act was to recognize trained technicians to carry out physical therapy under physicians' orders; the licensing of these technicians for independent practice would mean repudiation of the basic principles of the Medical Practice Act. Due to the emphatic protests of the profession, the bill died in committee. It was also contemplated to introduce a bill to license masseurs, colonic irrigators, physiotherapy, x-ray and laboratory technicians, "medical technicians," but with no right to independent practice. Vigorous opposition to this plan was voiced by the competent committees in New York County and as a result the bill was not presented.

With the medical profession now definitely awakened to its responsibilities and rights as to physical therapy, as part of the practice of medi-

cine, and with continued educational work and vigilance by your committees, it is hoped further attempts to destroy the safeguards of the Medical Practice Act to public health will similarly fail.

The chairman is happy to express his appreciation to the members of your committee, Drs. F. E. Elliott of Brooklyn, P. L. Forster of Albany, L. A. Hadley of Syracuse, G. A. Leitner of Piermont, Virginia Tannenbaum of Buffalo, and G. H. Turrell of Smithtown Branch, for their unfailing interest. He also wishes to voice his gratitude to the staff of the State Society office and to the Legislative Bureau for their painstaking help in many of the technical details of the committee's activities.

Respectfully submitted,

RICHARD KOVACS, *Chairman*.

April 15, 1932.

REPORT OF THE COMMITTEE ON ARRANGEMENTS

To the House of Delegates:

Gentlemen:

The Committee on Arrangements for the one hundred and twenty-sixth Annual Meeting of the Medical Society of the State of New York reports as follows:

Detailed arrangements have been made with the Hotel Statler in Buffalo for this meeting, May 23rd to and including May 25th, 1932. All activities of the Society, including registration, scientific and technical exhibits, general sessions, scientific sessions, banquet, meetings and dinner of the House of Delegates, will be held in the Hotel Statler, making attendance to any meeting most convenient.

Exhibits will be in place for the opening session, Monday morning, when registration will begin.

Special attention is called to the Clinical Day, Monday, May 23rd. Beginning at nine o'clock, Monday morning, the Committee has arranged for a variety of demonstrations and clinics in various hospitals, including an excellent opportunity to visit the New York State Institute for the Study of Malignant Disease. On this date a very large amount of clinical material will be available for those interested in diagnosis and treatment of malignant disease; also demonstrations of radium packs, radium implantation, high voltage x-ray, bone tumor exhibition, research work, etc.

The Banquet will be held Tuesday evening, May 24th, at 7:30 P.M. sharp. Tickets will be \$3.50 each. The Chairman of this Committee has arranged for an excellent entertainment and is endeavoring to make this an outstanding feature. There will be an address of welcome by the Mayor of Buffalo and addresses by the President and President-elect. Dancing will follow this program.

The Committee on Ladies' Entertainment have completed arrangements for a reception and luncheon to be held at the exclusive Garret Club of Buffalo on Tuesday, May 24th. On Wednesday there will be a trip to points of interest around Buffalo, including Niagara Falls and Old Fort Niagara which has recently been restored to its original state and is one of the landmarks in the history of the Niagara Frontier. Luncheon will be had en route. Transportation for these trips will be provided. A headquarters will be established on the Mezzanine Floor of the Hotel Statler, and the visiting ladies are invited to register on arrival to facilitate the arrangements.

All those desiring to play golf are requested to communicate with the Chairman of Committee on Arrangements or with Dr. Leon H. Smith, 606 Genesee St., Buffalo, N. Y.

Respectfully submitted,

HERBERT A. SMITH, *Chairman*.

April 15, 1932.

REPORT OF THE COMMITTEE TO REVISE THE CONSTITUTION AND BY-LAWS

To the House of Delegates:

Gentlemen:

The Committee appointed by the President to revise the Constitution and By-Laws in accordance with the resolution of the House of Delegates, June 1st, 1931, begs leave to submit the following:

CONSTITUTION

Article I.

Name and Purposes

Add in the 9th line following the word "medical" "and public health" and also at the end of the paragraph following the word "medicine." In the last line strike out the word "great." The paragraph will then read:

"The name and title of the Society shall be The Medical Society of the State of New York. The purposes of the Society shall be to federate and bring into one compact organization the medical profession of the State of New York; to extend medical knowledge and advance medical science; to elevate the standard of medical education; to secure the enactment and enforcement of just medical and public health laws; to promote friendly intercourse among physicians; to guard and foster the material interests of its members, and to protect them against imposition; and to enlighten and direct public opinion in regard to the problems of medicine and public health."

Articles II, III and IV remain the same.

Article V.

Officers

In the 7th line following the word "thereof" place a period, striking out the word "and." Also strike out lines 8, 9, 10, 11 and half of 12. The 12th line to be changed to read as follows:

"The Officers shall take office at the termination of the annual meeting at which they were elected with the exception of the Councilors elected by the District Branches who shall take office at the termination of the next annual meeting of the State Society."

Article VI.

Trustees

Strike out of the 2nd line the words "elected as such Trustees." Strike out the second paragraph. The Article will then read:

"The Board of Trustees shall consist of five members. The President, the Secretary and the Treasurer shall sit with the Board of Trustees with voice but without vote."

Article VII.

Censors

Strike out the first 2 paragraphs and insert the following:

"The Board of Censors shall consist of the President, the Secretary and the eight District Councilors.

"Five Censors shall constitute a quorum.

"The President and the Secretary of the Society shall sit as Chairman and Secretary respectively of the Board of Censors but without vote except that in case of a tie the President, sitting as Chairman of the Board of Censors, shall cast the deciding vote."

The 3rd paragraph now becomes the 4th paragraph and remains the same.

Article VIII.

Meetings

In the 1st line strike out the words "and the Intermediate Stated." In the 2nd line strike out the letter "s" of the word "Meetings" and change the word "or" to the word "and." The paragraph will then read as follows:

"The Annual Meeting of the Society and of the House of Delegates shall be held at the time and the place designated by the House of Delegates."

In the 4th line, strike out the last word "The," also strike out the 5th, 6th and 7th lines and insert after the words "House of Delegates." the following:

"When the House of Delegates is not in session the Council shall exercise all the rights and duties of the House of Delegates that are not inconsistent with the Constitution and By-Laws of the Society."

Article IX.

Funds

In the 7th line make a new paragraph beginning with the words "No funds of the" In the 11th line strike out the letter "s" of the word "Committees," and the letter "s" of the word "members" in the 12th line; in the 12th line following the first word "of" insert the word "any"; in the following word "Committees" strike out the letter "s"; in the 14th line following the word "been" insert the words "recommended by the Executive Committee and." The second paragraph of Article IX will then read as follows:

"No funds of the Society shall be expended for any purpose, except by the authority of a resolution of the Board of Trustees, nor shall any indebtedness be incurred by any officer, Committee or member of any Committee of the Society as a charge against the Society until the

same shall have been recommended by the Executive Committee and approved by the Board of Trustees."

Article X.

Referendum

In the 1st line strike out the words "annual or stated"; in the second line strike out the words "Society or of the"; in the 7th line strike out the words "or the Council"; in the 10th line following the word "after" add the word "the" and in the same line following the word "mailing" add the word "of"; in the 12th line following the words "majority of" strike out the rest of the line and also 13th, 14th and 15th lines. Article X will then read as follows with new additional wording at the end:

"At any meeting of the House of Delegates a majority of the members present may order a referendum on any question consistent with the Constitution and By-Laws and in accordance with such regulations respecting the submission of the question as the House of Delegates may prescribe. The members shall vote thereon by mail. The poll shall be closed at the expiration of fifteen days after the mailing of the question; and if the members voting shall comprise a majority of all the active members of the Society, a majority of such vote shall determine the question and be binding on the Society and the House of Delegates. The Council may, in a similar manner, order a referendum to the House of Delegates."

Article XI.

District Branches

Sec. 1. 7th line combine:
"Dutchess Putnam."

Article XII.

County Societies

In the 1st line change the word "and" to "or"; the balance of the first two paragraphs remaining the same. Add as a third paragraph the following:

"If there should be an insufficient number of physicians and surgeons in any of the counties of this State to form themselves into a component county medical society, such physicians may become members of the component county medical society of an adjoining county when eligible by the Constitution and By-Laws of such county society."

Article XIII.

Amendments

Second paragraph, 4th line following the word "published" insert the words "at least," in the same line following the word "once" add the words "and at least one month," the paragraph will then read as follows:

"Notice of the proposed amendment shall be given at a previous annual meeting of the House of Delegates, and before the same can be acted upon, it shall be published at least once and at least one month before the annual meeting in the official publication of the Society."

Third paragraph, 1st line following the word "the" insert the words "members of the House of" and change the first letter of the following word "delegates" to a capital "D". The paragraph will then read as follows:

"A two-thirds vote of the members of the House of Delegates present and voting shall be necessary for adoption."

BY-LAWS

Chapter I.

Membership

Sec. 1 remains the same.

Strike out Sec. 2 and insert the following:

"Sec. 2. Any member expelled from his component County Society or suspended from its rights and privileges shall likewise be expelled or suspended for the same period from this Society. The right of appeal to this Society shall not be impaired nor shall such appeal prevent the carrying out of the judgment of the county society pending such appeal. Members not in good standing or ceasing to be members of their county societies shall ipso facto have the same status in this Society."

Strike out the first sentence including four lines of Sec. 3 and insert the following:

"A member in good standing in his component county medical society reaching seventy years of age may ipso facto have the privilege of applying for retired membership in the State Society."

The balance of Sec. 3 remains the same beginning with "All such applications etc."

In Sec. 4, 10th line insert the words "House of" before the word "delegates" also changing the letter "d" to a capital "D."

Sec. 5 remains the same.

Chapter II.

House of Delegates

Sec. 1 5th line strike out "; (d) Trustees" and following the word "and" in this same line change "(e)" to "(d)."

Sec. 2 New Section will read as follows:

"Sec. 2. A delegate to this Society shall not be considered in good standing or entitled to vote in the House of Delegates if the component county medical society by which he was elected is in default of the payment of any dues or assessments imposed by the House of Delegates, or if such component county medical society shall at the time be under sentence of suspension imposed by the House of Delegates, or if such

delegate is not in good standing in this Society, or in the component county medical society to which he belongs. The term of a delegate elected by a County Medical Society shall begin at the first annual meeting of the House of Delegates subsequent to his election."

The present Sec. 2 now becomes Sec. 3.

In renumbered Sections 5, 6 and 7 strike out the word "It" at the beginning of each Section and in each Section insert the words "The House of Delegates."

In renumbered Sections 5, 6 and 7 strike out the word "It" at the beginning of each Section and in each Section insert the words "The House of Delegates."

In Sec. 8 (formerly Sec. 7) No. 8 insert the words "the Board of" following the word "of" making it read as follows:

"8. Report of the Board of Trustees."

Chapter III.

Election of Officers

Sec. 1. 1st line strike out the comma following the word "officers" and strike out the word "Trustees" in the same line. In the 11th line of Sec. 1 strike out the word "Trustees."

Sec. 2. Insert New Section as follows:

"The Officers, except the Councilors and Trustees, shall be elected for one year or until their successors have been duly chosen.

"One Trustee shall be elected annually for a period of five years and in the event of a vacancy a Trustee shall be elected for the unexpired term."

Old sections 2, 3, 4 and 5 remain the same with the exception of renumbering.

Strike out Sec. 6 entirely.

Chapter IV.

Council

Sec. 1. strike out lines 3, 4 and 5. In the 2nd line following the word "Delegates" place a period and add the new sentence as follows:

"The members of the Council shall hold office until their successors are duly elected and qualified."

Sec. 2 remains the same.

Strike out old Sec. 3 and insert new Sec. 3 as follows:

"Sec. 3. A quorum shall consist of eleven members."

Sec. 4 and Sec. 5 remain the same.

Sec. 6 strike out entirely.

Sec. 7 now becomes Sec. 6 and reading matter remains the same.

Chapter V.

Executive Committee

Sec. 1 in the 4th line following the word "President," insert the words "the President-elect."

Sec. 1. in the 15th line following the word "immediately" strike out the words "and elect a Chairman and a Vice-Chairman" and insert the words "under the Chairmanship of the President of the Society and proceed to elect a Vice-Chairman." Sec. 1 will then read as follows:

"Sec. 1. At its first regular meeting the Council shall choose by a majority vote five members of the Council, three of whom shall be councilors, who together with the President, the President-elect, the Secretary, the Treasurer and the immediate Past President shall constitute the Executive Committee. Candidates for election to the Executive Committee shall be nominated by the President, but other candidates may be nominated by any member of the Council. The Executive Committee shall hold office until the following annual meeting of the Council or until their successors shall be duly chosen. The Executive Committee shall, when elected, organize immediately under the Chairmanship of the President of the Society and proceed to elect a Vice-Chairman. The Executive Committee shall hold regular meetings at times and places that shall be fixed by the Chairman and any two members of the Executive Committee may require the Chairman thereof to call a meeting for such time and place as shall be designated by them in writing, of which the members shall have at least two days' notice. Five members shall constitute a quorum. It shall prepare a budget to be acted upon by the Board of Trustees."

Sec. 2. remains the same.

Sec. 3. in the 3rd line following the word "appoint" insert the words "a Publication Committee,". In the 4th line the word "editor" the letter "e" to be changed to a capital letter "E."

Sec. 3. in the 7th line following the word "society," insert the following sentences:

"The Standing and Special Committees of the Society shall report to the Executive Committee and shall be subject to the jurisdiction of the Council or the Executive Committee when the House of Delegates is not in session. No Standing or Special Committee shall inaugurate or initiate any policy or commit the Society to any policy unless the same has been expressly approved by the House of Delegates, and, or the Council and, or the Executive Committee."

The balance of Sec. 3 remains the same.

Sec. 4. in the 3rd line strike out the word "President" and insert the word "Chairman."

Sec. 5. in the 4th and 5th lines strike out the words "not repugnant to" and insert the words "in conformity with."

Chapter VI.

Trustees

Sec. 1. in the 5th line following the word "meetings," insert the sentence "The Board of Trustees shall meet at least bi-monthly."

Sec. 2. in the 3rd line strike out the word "manage" and insert the word "supervise."

Secs. 3, 4 and 5 remain the same.

Chapter VII

DUTIES OF OFFICERS

President

Sec. 1. in the 3rd line following the word "Censors." insert the sentence "He shall be Chairman of the Executive Committee."

At the end of Sec. 1 following the words "the Council shall require." add the sentence:

"He shall not accept any civic or public duties without the advice and consent of the Council."

Sec. 2 remains the same.

President-Elect

Sec. 3. in the 3rd line following the word "Council" strike out the words "but shall attend the meetings of the" and insert the words "and the." In the 4th line strike out the words "without voice or vote."

At the end of Sec. 3 insert the sentence:

"He shall not accept any civic or public duties without the advice and consent of the Council."

Sec. 4 and Sec. 5 remain the same.

Secretary

Sec. 6. 6th line from the bottom strike out the words "The amount of his salary shall be fixed by the Board of Trustees."

Sec. 7 remains the same.

Treasurer

Sec. 8. strike out the last two lines following the word "Trustees": "His salary shall be fixed by the Board of Trustees."

Assistant Treasurer

Sec. 9. 6th line, following the words "shall be elected" insert the words "who, at the expense of the Society, shall give a bond for the faithful performance of his duties, which shall be approved by the Board of Trustees as to the amount, form and surety." The balance of the section remains the same.

Sec. 10. remains the same.

Chapter VIII.

Traveling Expenses

Sec. 1. First paragraph remains the same. Second paragraph, in the 2nd line following the word "railroad" insert the words "and Pullman." In the 4th line following the word "President-Elect" insert the words, "and all other Officers of the Society." In the 5th line strike out the words "attending committee meetings." and insert the words "engaged upon official business." In the 25th line strike out "of \$250.00" and in-

sert the words "not to exceed \$200.00." The second paragraph of Chapter VIII will then read as follows:

"The President and the Secretary shall be allowed intrastate railroad and Pullman fares and a per diem for maintenance not to exceed fifteen dollars. The President-Elect, and all other Officers of the Society, shall be allowed traveling expenses when engaged upon official business. The members of the Board of Trustees, of the Council, and of the Executive Committee shall be allowed railroad fares to and from the places of meeting of these respective bodies. In all cases where no appropriation has been allowed a Standing or Special Committee, traveling expenses shall be allowed the individual members of the committee. Proper vouchers must be filed with the Secretary and approved by the Board of Trustees before any such allowance may be made. The Delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return. The vouchers of such expense shall be approved by the Board of Trustees before payment. Each District Branch shall be entitled to receive a sum not to exceed \$200.00, exclusive of the work done by the Secretary regarding notices, programs, etc., to defray the expenses of holding the annual meeting of such District Branch, provided a proper statement of such expense shall have been presented to the Secretary and approved by the Trustees. All bills, claims or vouchers herein provided for shall be filed within thirty days after the date of the incurring of such expense. This time may be extended for any cause by the Board of Trustees and such extension shall not exceed ninety days."

Chapter IX.

Censors

Sec. 1 and Sec. 2 remain the same. Sec. 3 remains the same with the addition of the following paragraph which is new matter:

"If the appellant desires to be present in person or by counsel at the hearing of said appeal, the notice of appeal must so state. In that event, the appellant must file with the notice of appeal a bond in the sum of \$500.00 to cover the costs of said appeal. If the appellant fails to appear in person or by counsel upon the hearing of said appeal, he shall forfeit to the Medical Society of the State of New York such share of said bond as represents necessary expenditures incident to convening the Board of Censors for the hearing of said appeal."

Sec. 4, Sec. 5 and Sec. 6 remain the same.

Sec. 7 remains the same with the addition of the following paragraph which is new matter:

"The appellant must also state if he desires to be present in person or by counsel."

Sec. 8 and Sec. 9 remain the same.

Chapter X.

Committees

Sec. 1. 4th line following the words "the Council and" insert the words, "or the Executive Committee and, or". The paragraph will then read as follows:

"Sec. 1. The Committees shall be classified as Standing, Reference and Special Committees, Standing and Special Committees shall report to the Council and, or the Executive Committee and, or the House of Delegates."

Sec. 1. strike out the 12th line "Committee on Medical Research."

Sec. 2 remains the same.

Sec. 3. 2nd line strike out the word "three" and insert the word "five."

Sec. 3 will then read as follows:

"Sec. 3. The Committee on Legislation shall consist of five members including the Chairman."

Sec. 4. strike out entirely and insert the following:

"Sec. 4. The Committee on Public Health and Medical Education shall consist of nine members including the Chairman. It shall be the function of this Committee to investigate, study and report to the House of Delegates on matters of public health, preventive medicine, and medical education. It shall gather facts regarding the activities of health organizations, both official and non-official, and report to the House of Delegates regarding the same when it so deems necessary. It shall be the duty of this Committee to advise the House of Delegates as to plans for post-graduate education for the general profession and shall be in charge of carrying out such plans as are approved by the House of Delegates. It shall cooperate with similar committees of component county societies in carrying out recommendations of the House of Delegates dealing with public health and medical education."

Sec. 5 strike out entirely and insert the following paragraph:

"Sec. 5. The Committee on Medical Economics shall consist of nine members, including the Chairman. The function of this Committee shall be to conduct investigations, to gather facts, to make studies or surveys on the general subject of the relationship of the physician individually and collectively with the public. It shall receive matters of general public information and study them both in regard to their effect upon the practice of medicine in private or institutional work. It shall concern itself with the financial aspects of the practice of medicine, throughout the State of New York, especially insofar as it affects the efficiency of medical service to the public. It

shall concern itself with all economic phases regarding the practice of medicine in hospitals, private or public clinics, commercial organizations and other institutions established for diagnosis and treatment."

Sec. 6 and Sec. 7 remain the same.

Sec. 8 strike out entirely.

Sec. 9, 1st line, the word "Chairman" shall be changed to "Chairmen."

Sec. 9 now becomes Sec. 8.

Reference Committees

Sec. 10 strike out entirely and insert the following paragraph which is now known as Sec. 9:

"Sec. 9. At least one month before the meeting of the House of Delegates the Speaker shall appoint such Reference Committees as he shall deem expedient for the purposes of the meeting. Immediately after the organization of the House of Delegates he shall formally announce the appointments to the Committees. Only members of the House of Delegates are eligible for appointment on the Reference Committees. Such Committees shall consist of five members, three members constituting a quorum, and shall serve during the meeting at which they are appointed."

Sec. 11 strike out entirely and insert the following paragraph which is now known as Sec. 10.

"Sec. 10. Reports of Officers and Standing Committees shall be printed at least one month before the meeting of the House of Delegates and sent to the members of the Reference Committee appointed according to Section 9, for their preliminary consideration. All recommendations, resolutions, measures and propositions presented to the House of Delegates and which have been duly seconded shall be referred by the Speaker to the appropriate Reference Committee."

Sec. 12, 13, 14 and 15 remain the same with the exception of renumbering.

Chapter XI

Meetings

Sec. 1. 1st line strike out the word "regular." In the 8th line in the word "Affidavit" change the capital "A" to a small "a".

Sec. 2. 2nd line strike out the word "meeting" and insert the word "or" following the word "annual." In the 2nd line following the word "special" strike out the words "or intermediate stated." In the 2nd and 3rd lines change the word "meetings" to the word "meeting." Sec. 2 will then read as follows:

"Sec. 2. Each member in attendance at the annual or special meeting of the Society, shall enter his name and the name of the component county medical society to which he belongs in a register to be kept by the Secretary of the Society for that purpose. No member shall take

part in any of the proceedings of such meeting until he shall have complied therewith."

Secs. 3, 4 and 5 remain the same.

Sec. 6, 3rd line, following the word "delegates," insert the words "or at request of the Council." Sec. 6 will then read as follows:

"Sec. 6. Special meetings of the House of Delegates shall be called by the Speaker upon the request, in writing, of fifty delegates, or at request of the Council, and in case of the failure, inability or refusal of the Speaker to act, such meetings may be called by a notice thereof subscribed by fifty delegates."

Chapters XII and XIII
remain the same.

Chapter XIV.

Component County Societies

Sec. 1. remains the same with the addition of the two following paragraphs which are new matter:

"When a member in good standing ceases to practice in the State of New York he shall ipso facto cease to be a member of the Society and of his component medical society. His status shall be deemed that of a resigned member and all rights and title to any share in the privileges and property of the Society, the District Branch, or County Society, shall be deemed to have been forfeited by such action.

"The dues of any member of the Medical Society of the State of New York may be remitted for the current year on account of illness when the request is made by the member's component county medical society."

Sec. 2. strike out entirely.

Sec. 3 now becomes Sec. 2 and remains the same.

Sec. 4 and Sec. 5 are combined into one section and are now known as Sec. 3. In the 13th line of what is now known as Sec. 3 following the words "said society" insert the word "and".

Sec. 3 now reads as follows:

"Sec. 3. The Secretary of each component county medical society shall keep a roster of its

members and of all other registered physicians of such county in which shall appear the full name of each of said physicians, the date of his admission to such society, his residence and the date when his license to practice medicine in this State was granted. He shall note any changes in said roster by reason of removal, death, revocation of license or other disqualification.

"He shall forward said roster and information, together with the names and places of residence of each of the officers of said society and the names and residences of each delegate of the House of Delegates of said society to the Secretary of this Society thirty days before the date of its annual meeting."

Sec. 6 and Sec. 7 remain the same with the exception of renumbering.

Chapter XV.

Miscellaneous

Secs. 1, 2, 3 and 4 remain the same.

Sec. 5. 1st line following the word "Officers" insert the word "and", and remove the comma in the first line following the word "Officers" and in the second line following the word "Society."

Sec. 6 remains the same.

Chapter XVI
remains the same.

Chapter XVII.

Amendments

Secs. 1 and 2 remain the same.

Sec. 3. 2nd line following the word "the" insert the words "House of" and change the letter "d" of the following word "delegates" to a capital "D".

Sec. 3 will now read as follows:

"Sec. 3. The affirmative vote of two-thirds of the House of Delegates present and voting shall be necessary for adoption."

Sec. 4 remains the same.

Respectfully submitted,

CHARLES G. HEYD,
Chairman.

April 15, 1932.

REPORT OF THE COMMITTEE ON PERIODIC HEALTH EXAMINATION

To the House of Delegates:

Sirs:

The Committee on Health Examination begs to present its Third Annual Report as follows:

(1) A brief general review of the three years' work; (2) an analytical statement of the radio broadcasting of this year, and (3) certain recommendations with reference to the future. All other work of this committee has been covered in monthly reports to the council which are concerned with the progress and development of

projects as reported in our last annual report and authorized by the House of Delegates.

1. *General Summary.* A health examination for every man, woman, and child in the State of New York was and still is the objective of the committee. It envisioned a continuing program of development rather than a series of brief, high potential campaigns. This program has been printed, approved, and followed. It contemplated two efforts. (1) The education of the public. (2) Aid to physicians and the medical profession

in the furtherance of the health examination and pre-clinical medicine. The committee stated at the outset, that it believed a ten-year campaign should be waged. Its three years' experience has inclined it to the opinion that this subject should be incorporated as one of the standard and continuing labors of the medical profession. It believes that pre-clinical medicine will be an increasing duty, an increasing service, and an increasing privilege of the medical profession. The committee has declared the faith that lies in them, in the *Journal of the Society* and in its several reports, and has set forth the results of its various labors. It remains only to give a report of the last year's work. For the sake of brevity this report will be confined to one feature—broadcasting—a part of the division of our work related to the education of the public.

Principles of Radio Broadcasting. From the first this committee has followed the plan of concentrating upon one purpose, using one method and driving home with full concentration all of its energy. We therefore concentrated upon Health Examinations for Women, as announced in our original plan in 1929. Similarly, we concentrated upon the education of the public and again restricted ourselves to the use of the radio. In our last annual report we called attention to the fact that there were powerful forces which could be utilized to bring to the attention of the public the need of the Health Examination: We believe that we could stimulate executive action of a continuing nature and instead of doing the work ourselves to get our willing friends to do it for us, thus serving them, the public, and our purpose. It is better to act as train despatcher than to push a wheel-barrow. A program of this kind depends entirely upon the importance of the message, mutual confidence, and alignment of effort. Cooperation always results when the welfare of humanity is truly and greatly to be served.

Preliminary Steps. In June, 1930, we held an open conference at Rochester and invited the representatives of the State-wide women's organizations to be present. They came, they offered cooperation and in the Fall of the same year the New York State Federation of Women's Clubs and the National Congress of Parents and Teachers passed stirring resolutions favoring health examinations, re-enlivening their own health programs and backing up ours. The health examination program of the Business and Professional Women's Clubs of the State was stimulated to further activity. Dr. Marion C. Potter of Monroe County, a member of this committee, took a large part on following through this phase of cooperation and development. In the Spring of 1930, with the backing of these organizations, we procured a radio opportunity we had been working to get. This was reported in June, 1931, to the House of Delegates. The project was approved.

Opening. Accordingly the broadcast was opened on September 17, 1931, with the Columbia Broadcasting System. It will continue until the close of the fiscal year in May. The time given to us was part of the most highly valued woman's hour—between eleven and noon. It was put into the period of the National Radio Homemakers' Club, for which 500,000 women listeners in every morning are expected, and in the opinion of radio experts this number is exceeded by one-half million more. This broadcast on the National network of the Columbia Chain with the number of stations ranging upward to seventy-two, included in a circle bounded by Toronto, New York, Florida, Oklahoma, and Colorado included among the stations most consistently taking the program the following:

Station	City
WABC	New York City
W2XE	New York City
WOKO	Albany, New York
WPG	Atlantic City, New Jersey
WNAC	Boston, Massachusetts
WKBW	Buffalo, New York
WBT	Charlotte, North Carolina
WDOD	Chattanooga, Tennessee
KVOR	Colorado Springs, Colorado
KRLD	Dallas, Texas
WXYZ	Detroit, Michigan
WTAQ	Eau Claire, Wisconsin
WHP	Harrisburg, Pennsylvania
WDRG	Hartford, Connecticut
WLAP	Louisville, Kentucky
WQAM	Miami, Florida
WISN	Milwaukee, Wisconsin
WLAC	Nashville, Tennessee
WDSU	New Orleans, Louisiana
KFJF	Oklahoma City, Oklahoma
WDBO	Orlando, Florida
WJAS	Pittsburgh, Pennsylvania
WEAN	Providence, Rhode Island
KOH	Reno, Nevada
KDYL	Salt Lake City, Utah
KTSA	San Antonio, Texas
WTOC	Savannah, Georgia
KSCJ	Sioux City, Iowa
WSPD	Toledo, Ohio
WIBW	Topeka, Kansas
CFRB	Toronto, Ontario, Canada
WACO	Waco, Texas
WMAL	Washington, D. C.
WMT	Waterloo, Iowa
WORC	Worcester, Massachusetts

Acknowledgment. This was the truly munificent gift of the Columbia Broadcasting System and its officers, William S. Paley, President, Edward Klauber, First Vice-President, and Julius Seebach, Director of Program Operations. The committee therefore recommends that a resolution expressing the appreciation of the

House of Delegates for the great public service that has been rendered be spread upon the minutes and copies transmitted to the Columbia Broadcasting Company and to its several officers as mentioned, and also to the Secretary of the Department of Commerce, Ray Lyman Wilbur, with whose cooperation this powerful educational service was carried forward. The committee recommends further that a resolution be passed by the House of Delegates in appreciation of the courtesy and aid given by Mrs. Ida Bailey Allen, President of the National Radio Homemakers' Club, whose studio and facilities were given to the committee and who contributed so largely to the success of the whole series.

The whole broadcast was furnished by the radio authorities without cost to the Association. Confronted with this somewhat overwhelming opportunity the committee realized that the Medical Society of the State of New York was being put before the great public and its honor, reputation and good report were in our hands. We therefore invited as many of the leading State officers as possible to take part. The following were invited and gave addresses:

The President, Dr. William D. Johnson.

The Speaker of the House of Delegates, Dr. John A. Card.

A Member of the Board of Trustees, Dr. Nathan B. Van Etten.

The Chairman of the Legislation Committee, Dr. Harry Aranow.

The Chairman of the Committee on Public Health and Medical Education, Dr. Thomas P. Farmer.

The Chairman of the Committee on Public Relations, Dr. James E. Sadlier.

Ex-President, Dr. James N. Vanderveer, whose Presidential address had given the committee definite factors of guidance in its publicity work.

This insured the presentation to the public of a message of the State Society in accordance with its established plans and the spirit which has carried it forward. The committee herewith wishes to record its appreciation of the courtesy of these officers and the high value of their services.

The committee has been fortunate in securing medical speakers from among the men who have not only won prominence in the profession but have contributed to its dignity and progress. The following is a list taken chronologically:

Walter T. Dannreuther, M.D.

Foster Kennedy, M.D.

Roger H. Dennett, M.D.

Walter L. Niles, M.D.

Herman O. Mosenthal, M.D.

Harlow Brooks, M.D.

W. W. Herrick, M.D.

Carolyn C. Williams, M.D.

T. Stuart Hart, M.D.

Marion Craig Potter, M.D.

Mary M. Crawford, M.D.

Walter A. Calihan, M.D.

Phoebe M. Van Voast, M.D.

Lenna F. Meanes, M.D.

A. J. Rongy, M.D.

Hugh Chaplin, M.D.

Charles G. Kerley, M.D.

Walter Timme, M.D.

In many cases these physicians not only gave serviceable addresses to the public, but refreshed their own interest in health examinations and in addition transmitted to various societies with which they were associated, a new stimulation in the premises. Hugh S. Cumming, M.D., the Surgeon General of the United States Public Health Service, took over our whole broadcast for the entire month of January. We introduced his speakers from the New York studio; the broadcasting was done from Washington (WMAL). The closing announcement was made from the New York studio (WABC). This gave a welcome and impressive endorsement of our efforts an added definite professional contributions. New York State gave its contribution in the address of Dr. Thomas Parran, Jr., the Commissioner of Health, who delivered the first broadcast after the committee's preliminary announcement. Mrs. Franklin D. Roosevelt was kind enough to introduce our own President, Dr. W. D. Johnson.

Cooperation. This committee had deliberately planned this broadcast to develop the acquaintance and cooperation of the social forces aforementioned, in addition to its direct service to the women of the State. Accordingly it procured distinguished women speakers representing these organizations, usually a responsible officer and often the national president. In this way, they severally added to the direct value of this message, their endorsement of the work of the Medical Society of the State of New York and to the health examination. They refreshed their own faith and practice of their own health programs and opened the way for more general cooperation. In this, our committee added its effort to the service of the Committee on Public Relations. These organizations included the most representative and influential women's associations of the United States as follows:

1. The General Federation of Women's Clubs, the combined representative body of the women of the Nation, by Mrs. John F. Sipple, President.

2. The National Council of Catholic Women, by Mrs. Michael Gavin, its President for many years.

3. The National Y. W. C. A., by Mrs. Robert E. Speer, President.

4. Girl Scouts of America, by Mrs. Nicholas F. Brady, President.

5. The Camp Fire Girls of America, by Miss Florence Hughes, Vice-President.

6. The American Women's Association, by Miss Anne Morgan.

7. The Henry Street Nurses' Settlement, by Miss Lillian Wald.

8. The Child Health Association, by Mrs. Aida de Acosta Breckinridge.

9. The New York State Federation of Women's Clubs, by Mrs. William D. Sporborg, President; Miss Harriett Mayer, Chairman.

10. Child Study Association of America, by Mrs. Sidonie M. Gruenberg, Executive. And many others.

Insofar as the Medical Society of the State of New York and these organizations are in acquaintance and cooperation, it is fortunate and the public profits. Insofar as they are not, there is something highly desirable yet to be realized.

But this group is only a part of organized womanhood. The field may be cultivated further. Already, however, the results are becoming concrete. Three of these national groups have asked us to formulate plans, methods and programs, in health examinations for their membership, which totals over 1,000,000 in the United States. The work is launched. The greater profits will come year by year in the future, as the project is developed. The rewards of continuing effort may well be very great. This closes the discussion of the radio broadcast.

For Men. It must be remembered that the broadcast was part of our program of health examinations for women. We propose to take the next logical step and open a similar campaign for health examinations for boys and men at an invitation conference to be held at Buffalo on May 23, 1932. Dr. Russell of Buffalo is in charge. Representatives of the men's and boys' national and State organizations are invited. We hope we may turn over to the next administration a project well advanced and a project ready for launching.

Summary and Recommendations. With reference to the whole matter of health examinations the committee feels the necessity of making further recommendations based upon its three years of work.

1. We confirm our original program as to the need of a health examination by the people, as stated in our two previous annual reports. We believe it to be the manifest duty of the medical profession to teach the public with reference thereto and to instruct themselves how they may increasingly improve and extend their service in the health examination and personal preventive medicine. A ten-year

program was outlined. Three years have passed. What work has been done and what accomplished, is for others to say and the future to prove. What work has yet to be done is for others to do. We did not originate anything materially new. We carried it forward. We now pass it on. But now is no time for the Society to falter. It is the time for tenacity.

2. We recognize the fact that the health examination is only a method in the large field of pre-clinical medicine or personal preventive medicine, which promises to be one of the most important, popular and scientific phases of medicine in the future; and we, as a profession, should be alert and unflaggingly persistent if we wish to take and keep our leadership therein. It is the duty of our committee to terminate its service in such a manner as will best serve our successors. We therefore present the following additional recommendations:

No. 3. Inasmuch as the work of this Special Committee falls largely under three divisions of endeavor, each of which is covered by a Standing Committee, it is suggested to the Council and House of Delegates that the Committee on Health Examinations be discontinued, and that activities be assigned to three existing committees as follows:

(a) *That the radio broadcast*, which is for the education of the public and which has been well put on its feet, be turned over to the Council for the Committee on Press Publicity, with the recommendation that this opportunity is so great that it should not be confined to one single purpose of the Society but extended to its general functions, with due regard to the continuation of the health examination programs.

(b) *That the work of cooperation with the several large National Societies be turned over to the Council for the Committee on Public Relations*, with the definite understanding that the cooperation already elicited for our health examination work be carried forward. It may be pointed out that these several societies, when well informed of our purpose and accustomed to cooperate with us, would wield great, if not decisive, power in medical matters of public concern.

(c) *That the education of the physician with reference to health examinations, belongs similarly within the scope of the Committee of Public Health and Medical Education.*

The Committee in considering the above recommendation could not express itself unanimously in approval, therefore it formulated the following two alternative recommendations:

Recommendation 4. Continue a Special Committee on Health Examination for one year (or

more), during which time the three standing committees above mentioned will gradually but definitely absorb its activities into their own committee procedure. Postpone further action until the year shall have been completed.

Recommendation 5. This recommendation is the same in every particular, as recommendation No. 4, with the exception that the name of the Special Committee should be changed, from the Committee on Health Examinations to (No. 5a) "Committee on Preventive Medicine" or (No. 5b) "The Committee on Personal Preventive Medicine." It is advanced in favor of this recommendation, that the health examination is a form of practical procedure which, although it forms a most important element in preventive medicine, is nevertheless only a beginning of a health service. This health service is a personal service rendered by the Physician to his client, continuing from year to year, and designed to prevent illness as well as to bring to the client's life all the benefits and betterments that the science of medicine can provide.

This is a much larger matter than the health examination. It extends forward into the future and development of a larger sphere of usefulness on the part of the physician and it rightly belongs in his field.

Recommendation 6. That proper notice is hereby formally given that a "Standing Committee on Personal Preventive Medicine" be formed, and the necessary constitutional amendments be prepared by an officer assigned.

Post Graduate Institute. The committee is formulating a plan of carrying on a week or a fortnight, of post graduate instruction in health examinations in preventive medicine, the date for which is tentatively set for a time before, during, or after the Graduate Fortnight of the Academy of Medicine, to be held next Fall. The work of this committee in this regard is essential to the orderly development of its duties even though it is recognized that next Fall is a time beyond its own tenure. The committee has accordingly conferred with several continuing bodies of competent jurisdiction in this field. A sub-committee of the Greater New York Society has been authorized to confer with us and the matter is in a definitely formative stage.

Censorship. In preparing to conduct its broadcast the committee perforce gave earnest study to this subject. It formulated a set of

suggestions to guide its speakers. These were followed by the publication of the New York County-Academy of Medicine regulations: these again by the formation of the State Press Publicity Committee. To this committee we turned for this service, and it was rendered by the chairman with understanding, decision, and despatch, for which we are grateful. We have been conscious of the fact that we were sending our message into other States. We were giving guidance to the clientele of our neighboring State Medical Societies without their official knowledge or consent. We were not entirely at ease, nor yet did we feel authorized to take up the matter with three-quarters of the States in the Union. The matter is not simple. It involves the County, the State, and the National organizations. We recommend that it be studied.

The Medical Examiner. This is a pamphlet published periodically by the Greater New York Committee on Health Examinations. It came into being as a result of the New York City campaign and its publication has been continued. It has been used also in the Monroe County campaign. It has the real and important value of a continuing effort without which no campaign avails; a notable example of tenacity in a good cause. This committee wishes to call to the attention of the members of the House of Delegates the fact that issues of the Health Examiner may be made available for circulation by any County Society. Arrangements may be made direct with the Greater New York Committee on Health Examinations through the officers of the State Association, 2 East 103rd Street, New York City.

Acknowledgment. In closing this report the committee and the chairman in particular, wish to thank the officials of the State Society, the chairmen of its several committees, the editor of the Journal, and the administrative and executive staff, for their unflinching courtesy, understanding and helpfulness. The committee wishes to thank the House of Delegates and the retiring President for the privilege of serving the Society, and to say again, in closing, that this is the beginning and only the beginning, of a great work which must be carried forward.

Respectfully submitted,
C. Ward Crampton, Chairman.

April 15, 1932.

REPORT OF COMMITTEE TO STUDY THE NURSE PROBLEM

To the House of Delegates:

Your committee appointed to continue the study of the problems of nursing and nurse education reports greatly increasing interest by the medical profession in the quality of nursing service.

Many a physician recalls with regret the memory of a "natural born nurse" who intuitively supplemented his efforts to restore his patients to normal health and strength—without any scholastic or institutional training or any other endowment beyond an optimistic personality, native intelligence and an inflexible conscience which never hesitated over a disagreeable task.

This paragon seldom appears because she has been replaced by a multitude of individuals who wear a title and a uniform which cover equally the incompetent and the competent and lift them both to financial standards which are beyond the paying ability of a sick employer.

The physician also realizes that he too has changed his demand upon the nurse from homely comfort for his patient to skilled recording of trained observations—to the assumption of much responsibility—to the strict execution of orders—to skilled assistance to the execution during his absence of therapeutic technique and surgical procedures and often to playing the role of expert technician—her efficiency often dulling many of his five senses, especially in fully equipped hospitals where he may find her not only his right hand but both of his hands.

The physician may find a highly competent nurse indispensable but he is a lame worker with the incompetents often sent him by irresponsible registries.

The hospital care of his patients is generally satisfactory but the domiciliary care is another story because his patient cannot afford any but a house working nurse who cannot be expected to possess technical skill and who many times takes advantage of emergency distress to insist upon fees which amount to extortions.

There is in the opinion of your committee a real demand for the trained attendant as provided in our State law—for the highly educated trained nurse of exemplary character and for the public health nurse. Three types of nurses—all greatly needed, whose qualities should be definitely certified by local and State registration.

Your committee is dissatisfied with the present system of nurse education, believing that while the quality of the product of the best school and the poorest school claims to be the same, there is great unevenness in the real educational equipment and that over-production results not only in unemployment but in inferior personnel.

It is likely that any overcrowded profession will attract the best possible recruits. There are

now, according to the United States Bureau of the Census, 294,268 trained nurses, or one to every 416 people, and if we add to this 153,443 untrained nurses, we find that we have a nurse for every 273 people in the United States.

Our population has increased 16 per cent in ten years, while in the same period the number of trained nurses has increased 97 per cent, and untrained nurses 1 per cent.

New York State with a population of 12,588,066 has 42,000 trained nurses and 22,869 untrained nurses—totaling 64,869, or one trained nurse for every 293 people and a nurse of both kinds for every 193 people.

With the general field of medicine also overcrowded with one physician for every 650 people in the State of New York and the average physician employing a little more than one nurse a day, there are now about four times as many nurses as are needed in this State.

Last year there were again graduated in the United States 25,000 more nurses—a figure which will be duplicated in 1932. Over 100,000 nurses have been added in the last six years. We also find that the average professional life of the nurse is now longer than seventeen years and that many of them continue to work after they are married—all of which creates a situation impossible of solution.

Cutting down the number of schools will only partially solve the problem and raising standards is not entirely promising.

Cutting down the number of medical schools temporarily checked the numerical growth of the medical profession—but is now promising little relief to the army of physicians now in the United States, more than ample to serve all of the people, 145,000 physicians, of whom 2,500 die annually and are replaced by 5,000 new registrants. Foolish overproduction impoverishes everybody.

Nine hundred thousand hospital beds with 64 per cent occupancy in the non-governmental hospitals spells financial incompetence. Sharp curtailment must be made and strict censorship in the program of hospital building and also in the admission of more physicians and more nurses to the medical field.

The medical profession must share responsibility for the quality of allied professions—overproduction means unemployment, lowered morale and destruction of ambition.

Many hospital schools are training nurses because the service of student nurses is profitable. Sixteen per cent of the hospitals could close their schools without loss, but 84 per cent would lose money by so doing, the varying loss running up to \$23,000 annually, and so they will go on swelling the nursing pool until all restrictions are overflowed and the profession wrecked.

Your committee believes that an entire change

in nurse education should take place as soon as a method can be developed, that all basic education of the nurse should be carried by educational institutions, schools or colleges and after passing satisfactory examinations, students in sufficient numbers should be admitted to such general hospitals as may be approved by the American Medical Association and the American College of Surgeons for a two or three-year rotating service, as a final requirement for the R.N. degree.

Your committee believes that there should be additional provision for the graduate education of registered nurses in the specialties and for public health service.

Your committee believes that mental hygiene and psychiatry furnish fields scantily supplied by intelligent nurses.

Your committee believes that nurse midwives should be developed in the interest of a lower general mortality in obstetrics. Fifteen per cent of all of the obstetric deliveries in the United States are now being attended by midwives, most of whom are incompetent, ignorant and dirty.

The Medical Society of the County of New York, through a special committee on nursing has tried to define educational, character and ability qualifications of nurses and has secured the cooperation of the department of licenses through a very intelligent commissioner. We here insert a portion of a report presented at a meeting on February 26, 1932, at which Dr. Goldmark read the following letter from Commissioner Geraghty:

"February 17, 1932.

"My dear Doctor:

The enclosed notice has been sent to every Licensed Nurses' Registry in the four boroughs today. I hope your campaign among the doctors and patients will also start at once, stressing the need of dealing with Licensed Agents, so that any failure to comply with rulings may be brought to the attention of the Department."

Dr. Goldmark further read the notice sent to the Licensed Nurses' Registries:

"To Licensees of Employment Agencies

"The following classifications of nurses have been recommended and adopted by the Special Committee on Nursing of the New York Medical Society for the better protection of the sick public, and to meet the growing demand of the public unable to pay the highly specialized registered nurse and for a better cooperation between the public, physicians and registries.

"These classifications have been made effective by the Department of Licenses and all agents conducting Nurses' Registries are hereby instructed that these classifications and require-

ments will be strictly enforced by the Inspectors of this Department.

"In effect February 15, 1932.

"Classification and Requirements of Agents:

"1st Class. Registered Nurses (as under present law). Agents must see Diploma and R.N. card for current year.

"2nd Class. Non-registered Nurses (this group will include nurses from non-registered schools who have had two years' hospital training, and who are in possession of a Diploma; and also R.N.'s of other States).

"3rd Class. Trained State Hospital Nurses (as under present law). Agents must see Diploma.

"4th Class. Undergraduates, Trained Attendants: At least nine months' hospital training for Undergraduates; Trained Attendants, card from State.

"Agents must verify training credentials of this group by writing to hospital-schools, and have references on file at agency before sending nurse on a case and must see cards issued by State to Trained Attendants.

"5th Class. Practical Nurses (all miscellaneous nurses). Agent must have two written references from physicians on file at agency before sending nurse on case.

"These requirements must be complied with before an agent gives an Identification Card to a nurse and before sending her on a case, regardless of her classification.

"Agents must send out the triplicate forms Sec. 181-A within twenty-four hours on every case as law requires. The patient's copy to be sent directly to him in a plain envelope without agency name.

"All references and triplicate copies must be available at agency for inspection at all times. Registers to be posted daily. Inspectors will be assigned to see that these instructions are being fulfilled in every detail.

"Failure of agents to strictly comply with these rules and requirements will warrant the revocation of license.

"Agents will keep this notice for future reference.

JAMES F. GERAGHTY, *Commissioner.*

On motion, it was decided to communicate this information to the Coordinating Committee through the Director of Activities.

On motion, it was decided to give this matter due publicity through the *New York Medical Week*, the newspapers and possibly the radio."

We have commended the visiting nurse in all of our reports and we feel that too much praise cannot be given to this form of delivering nursing service.

We believe that the extension of appointment

and hourly nursing is one of the best of the present workable schemes to furnish nursing at prices within the financial ability of the patient and that the work carried on by these visiting nurses' organizations among the poor is the finest benevolent operation that we know of—and that the way it is done by the visiting nurse organizations in the various parts of the State of New York represents a more economical and valuable use of the donor's dollar than is shown by any other group engaged in social work.

Your committee recommends the extension of the visiting nursing service and the extension of hourly and appointment nursing.

We recommend group nursing in hospitals—so planned as to divide the costs of nursing between several patients.

We recommend the development of trained attendants as provided by our State laws.

We recommend the development of nurse mid-

wives to replace many of the dangerously incompetent midwives now practising.

We recommend that this House of Delegates request a complete review of nurse education by the Board of Regents of the State of New York.

We recommend the transfer of all basic nurse education to High Schools or Junior Colleges, or other educational institutions.

We recommend the establishment of nurse internships in hospitals approved by the American Medical Association.

April 15, 1932.

REPORT OF THE FIRST DISTRICT BRANCH

The First District Branch of the Medical Society of the State of New York is composed of three county societies of Greater New York, and four of the lower Hudson Valley. All the county societies composing the District are active, and some conduct their affairs on a scale approaching that of the State Society. The scope of the District Branch is restricted, compared with that of the Branches in rural counties.

The major activity of the First District Branch during the past year was its annual meeting which was held in the Hotel Palatine, Newburgh, on Wednesday, October 7, 1931. The members began to assemble, seventy-five in number, at noon. Luncheon was served at one o'clock, after which addresses were made by Dr. W. D. Johnson, President of the State Society; Dr. Charles

Gordon Heyd, President-elect, and Dr. John A. Card, Speaker of the House of Delegates. The following scientific program was then carried out:

1. Medical Nomenclature—H. P. Logie, M.D., N. Y. Academy of Medicine.
2. Compensation and the Doctor—V. A. Zimmer, Director of Compensation Division of the State Labor Department.
3. Some Phases of Circulatory Failures and Their Treatment—Marcus A. Rothschild, M.D., New York.
4. Lung Abscess, Newer Phases of Treatment—Harry Wessler, M.D., New York City.

CHARLES D. KLINE, *President*.

April 15, 1932.

REPORT OF THE SECOND DISTRICT BRANCH

To the House of Delegates:

Gentlemen:

The policy of the Second District Branch during the past year has been to start building a superstructure on the foundation laid by previous administrations. Scientific medicine has not been neglected, but has been fostered by the component county societies, leaving to the Branch the problem of focussing the attention of the individual

physician to the problems of the practice of medicine.

The Twenty-fifth Annual Meeting was held in the Hotel St. George, Brooklyn, November 19, 1931. The afternoon was devoted to the recent polio epidemic, pneumonia, and health examination, and was participated in by fifteen members of the Branch, who presented brief, complete, summations of various special branches of medi-

cine. The members were privileged to hear the record of Doctor Martin B. Tinker's experience "The medical, special, and surgical treatment of goiter." The annual dinner in the evening was attended by about three hundred, who had the opportunity of meeting the officers of the State Medical Society and listening to a discussion of governmental medicine from the varied points of view of the medical profession, public health planning, health promotion, cost of medical care, and the obtaining of adequate medical services. These subjects were presented by: Dr. William D. Johnson, President of the State Society; Dr. Allan J. McLaughlin, Medical Director, United States Public Health Service; Mr. Michael M. Davis, Ph.D., Director of Medical Services of the Julius Rosenwald Fund, and Dr. Livingston Farland, President of Cornell University, and Chairman of Governor Roosevelt's Special Health Commission.

The attendance and enthusiasm of the annual meeting were an evidence of the interest of the membership in the State Society as represented by the Branch.

The activities of the component county societies have grown in multiplicity and detail. Each county society continues to publish a bulletin which is replete with the various interests and activities of the society. These publications have afforded a better and more complete contact and understanding between the four county societies composing the Branch. Limited space does not

permit even the tabulation of the many phases of medical work undertaken. Scientific programs have been of high character. Health activities have occupied a prominent place. The subject of medical economics has received serious consideration. Cooperation with the official and unofficial agencies has continued to be developed. Graduate education has continued to grow as a local feature. Membership shows a net gain.

Kings County continues to increase its library which is housed in its own building.

Queens County is developing its building into the medical center of the county.

Nassau County's suite of offices are being utilized as the seat of county wide medical activities.

Suffolk County has continued its interest in its county health unit, and has worked out an excellent cooperative program under the Welfare Law.

The Executive Committee, composed of the officers of the Branch and the presidents of the component county societies, has held one meeting to plan for the next annual meeting. It was decided to hold a spring meeting which would be social in character. Queens County Society will act as host for this special meeting. The Annual Meeting will again be held in November in Brooklyn, and Kings County will be the host.

Respectfully submitted,

LOUIS A. VAN KLEECK, *President.*

April 15, 1932.

REPORT OF THE THIRD DISTRICT BRANCH

To the House of Delegates:

Gentlemen:

Feeling that it would be of interest to the members of the State Society to know some of the history of the Counties of the State as well as the history of the Societies, I take pleasure in submitting the following as my Report as District Branch President:

Albany County, one of the original counties of the State of New York, was formed November 1, 1683, and at one time embraced nearly all that part of the State north and west of the present limits of the county and even included the whole of Vermont. The county lies on the west bank of the Hudson River and has an area of 544 square miles. In 1855 the population was 103,681 and included 174 physicians, 45 of whom were members of the Medical Society of the County of Albany, which Society was organized July 29, 1806, with nine members, William McClelland, President and Charles D. Townsend, Secretary. Its present membership numbers two

hundred fifty-seven, and the non-affiliates in the county, seventy-three. The meetings are held regularly on the third Tuesday of each month in Albany with an average attendance of ninety.

Columbia County was formed from Albany County, April 4, 1786, with an area of 688 square miles. The north line of "Kinderhook District" marks its northern boundary—the south line of "Kings District" its southern—the Taghkanick Mountains are along its east border and the Hudson River bounds it on the west. Iron, lead and manganese have been mined in the county and there are also several mineral springs. The Medical Society of the County of Columbia was organized in June, 1806, under the law of that year, it being the first county medical society to be so formed in New York. Its membership was eleven and its first President, William Wilson, and William Bay was its first Secretary. Columbia County numbered at that time about thirty-three thousand. The present membership of the Society is thirty-four and those physicians who

are not affiliated number nine. The date of the annual meeting is the first Wednesday in October at Hudson and that of the semi-annual the first Wednesday in May, with an average attendance of twenty-two. Post-graduate meetings were held 1927-1929 with a fairly good attendance.

Greene County was formed from Albany and Ulster Counties, March 25, 1800, and named in honor of General Nathaniel Greene of the Revolution. On May 26, 1812, parts were annexed to Ulster. The Catskill Mountains cover nearly the entire County—the main ridge extending along its southern border to Delaware County and a branch from this main ridge extending in a north-west direction from near Palenville through the County divides it into two nearly equal parts. The Medical Society of the County of Greene was organized the first Tuesday of July, 1806, with Dr. John Ely, President. The population of the County then was about 16,500, and in 1855, 31,137, and at this last date the physicians in the County numbered 47. The annual meeting of the Society will be held at Cairo on the second Tuesday of October. The other regular meetings are held on the second Tuesday of January, May and July. The present membership is twenty-one, and non-affiliates six. A Post-graduate course was given four years ago with a fifty per cent average attendance.

Rensselaer County was formed from Albany County February 7, 1791, and was named from the Rensselaer family, whose holdings at the beginning of the eighteenth century, by patents and purchase embraced nearly all of the present area (690 square miles) of the county of Rensselaer as well as that of Albany. The Medical Society of the County of Rensselaer was organized July 18, 1806, with an initial membership of twenty, Dr. Benjamin Woodward as President, and Dr. Ira M. Wells as Secretary. The population of the County at that time was about thirty thousand. The present membership of the Society is one hundred and thirty, non-affiliates, twenty-five. The annual meeting is in Troy on the second Tuesday of January and regular meetings on the second Tuesday of each of the other months with an average attendance of forty-five.

Schoharie County was taken from Albany and Otsego Counties, April 6, 1795, and in 1836 a small part was annexed from Greene County. The name signifies "drift wood" and was taken from the original Indian name To-wos-scho-her. The northerly branch of the Catskill Mountains lies along the southern border and spurs extend northward covering nearly the entire county. The area of the county is 675 square miles. The first settlement made by the whites was by the German Palatinates in 1711. A colony of about 700 coming here from East and West Camps on the

Hudson, where they had previously settled. The Medical Society of the County of Schoharie was reorganized September 21, 1857, with Dr. S. B. Wells of Middleburg as President, and Dr. C. C. Van Dyck, Secretary. Ten physicians became members at this time. The population of the County in 1855 was 33,519, about double its present population. The number of physicians in the county then was sixty-eight. The annual meeting of the Society is on the second Tuesday of October in Cobleskill, and the semi-annual meeting on the second Tuesday of May. Several Post-graduate courses have been held with good attendance. Average attendance at meetings—fifteen.

Sullivan County was partitioned from Ulster County, March 27, 1809, and named in honor of General John Sullivan of the Revolution. It has an area of 1,082 square miles. The County is largely drained by the Delaware River and its branches the waters of which with the many small lakes afford excellent fishing. The Medical Society of the County of Sullivan was organized October 3, 1809, with Thomas Royce, its first President, and Dr. Samuel Dimmick, its Secretary; the number of members, six. The population of the County at that time was six thousand. At present there are thirty-seven members and twelve non-affiliates in the County. The annual meeting is held at Liberty, on the second Wednesday in October and the semi-annual meeting on the second Wednesday of May. All other meetings are specially arranged as those of the Post-graduate courses. The average attendance at meetings, regular and special is thirty members.

Ulster County was formed November 1, 1683 (nearly 250 years ago), being thus one of the original counties, and it is said in its charter to "contain the towns of Hurley, Kingston and Marbletown, Foxhall and the New Paltz, and all villages, neighborhoods and Christian habitations on the west side of the Hudson River, from the Murderers Creek, near the Highlands, to the Sawyers Creek" extending west to the Delaware River. Its name is derived from the Irish title of the Duke of York. Its area is 1204 square miles. The Medical Society of the County of Ulster was organized in 1806. Its charter members and first officers are not known. The Society at present numbers sixty-seven and the non-affiliates in the county, twenty-six. The annual meeting is held in Kingston on the first Tuesday in December and the other regular meetings on the first Tuesday of February, April and October. In June an outing meeting is held. The average attendance at all meetings is fifty per cent.

Respectfully submitted,

HERBERT L. ODELL, M.D.

April 15, 1932.

President.

REPORT OF THE FOURTH DISTRICT BRANCH

To the House of Delegates:

Gentlemen:

It is with deep regret that owing to prolonged illness it has been impossible for me to visit the County Societies or perform the other duties required of the District Branch President, which if conditions had been different it would have given me much pleasure to have been able to do.

The Annual Meeting was held in Glens Falls on Wednesday and Thursday, October 21st and 22nd, 1931. At this meeting interesting papers were presented by Dr. Wilder Penfield of Montreal on "Neurology in General Practice—The Early Diagnosis of Remediable Lesions"; Dr. Edward MacD. Stanton of Schenectady on "Gall Stones"; Dr. Edward C. La Porte of Amsterdam on "Anthrax"; Dr. Samuel T. Orton of New

York City on "Certain Obstacles to the Development of the Language Function in Children"; Dr. Walter J. Craig of Albany on "The State Orthopedic Program"; Dr. Raymond G. Perkins of Malone on "Presentation of the Welfare Problem to the Board of Supervisors"; Mr. John R. Parker of Schenectady on "The Lawyer and the Physician in Welfare Work" and Dr. Grant C. Madill of Ogdensburg on "Medical Education."

Following a dinner at the Hotel Queensbury at which the Warren County Medical Society acted as host a very interesting address was given by Mr. J. Thacher Sears of Glens Falls on "The Great War Path."

Respectfully submitted,

FRANK VANDER BOGERT,
President.

April 15, 1932.

REPORT OF THE FIFTH DISTRICT BRANCH

To the House of Delegates:

Gentlemen:

As President of the Fifth District Branch of the Medical Society of the State of New York, I respectfully report as follows:

The Executive Committee of the Fifth District Branch, the Presidents of the component county societies, and Dr. Joseph S. Lawrence, executive officer of the State Society, attended a luncheon at the Hotel Utica, Utica, on Monday, June 15, 1931, for the purpose of discussing the condition and problems of the District and formulating plans for the annual meeting. There was a full attendance.

An invitation received from Dr. Richard A. Hutchings, President of the Oneida County Medical Society to hold the annual meeting of the Fifth District Branch in Oneida County was accepted. Later an invitation was received from Dr. W. W. Wright, Superintendent of Marcy State Hospital to hold our meeting at that institution.

The annual meeting was held at the Marcy State Hospital, Tuesday, September 29, 1931. We were fortunate to be able to hold our meeting in such a convenient place. I believe an institution like this, or a large hospital is the ideal place for a meeting. Dr. Wright and his able assistants made us all at home, not only during the Scientific Session but also at the luncheon at which about two hundred were the guests of the Marcy State Hospital.

The District was honored by having as guests, Drs. William D. Johnson, President; Daniel S. Dougherty, Secretary; John A. Card, Speaker, and Joseph S. Lawrence, Executive Officer of the Medical Society of the State of New York.

The Scientific Session which followed was opened by an address of welcome by Dr. William W. Wright of Marcy State Hospital.

"Pernicious Anemia, Differential Diagnosis and Treatment," Kenneth R. McAlpin, M.D., New York City.

"Cancer," Joseph Colt Bloodgood, M.D., Baltimore, Md.

"Modern Methods of Treating Syphilis of the Nervous System," Charles W. Hutchings, M.D., Marcy State Hospital.

"Some of the Compensation Problems Encountered in Surgical Practice," Percival K. Menzies, M.D., Syracuse.

"Compensation Law and the Physician," Mark A. Daley, General Secretary, Associated Industries of Buffalo.

We were also fortunate to be able to get such men as Dr. Bloodgood and Dr. McAlpin to address us. I believe such men out of the District help to make the meetings a success. It means a great deal of work on the part of the committee, but I think it is worth the trouble.

Respectfully submitted,

AUGUSTUS B. SANTRY, *President.*

April 15, 1932.

REPORT OF SIXTH DISTRICT BRANCH

In accordance with plans made early in the summer by the Executive Committee the regular meeting of the Sixth District Branch was held at the Iron Kettle Inn, near Waverly, on the 22nd of September.

Dr. George M. Cady, President, called the meeting to order and Dr. John A. Conway of Hornell, District State Health Officer, took up the consideration of "Typhoid Carriers, Surgical and Medical Management." In this he outlined the methods of eradication of foci of infection remaining after an attack of typhoid and his conclusions were that in most cases it would be necessary to attack them from a surgical standpoint.

The "County Health Unit" was the topic of a paper presented by Dr. Oliver W. H. Mitchell of Syracuse, a guest speaker. He presented the advantages and disadvantages of this set-up and drew the conclusion that it was better than the municipal and town arrangement that now obtains in most of the State. This drew out a good deal of discussion from various members and guests.

Drs. Hiram L. Knapp of Newark Valley, Henry E. Merriam of Ithaca and George R. Murphy of Elmira were appointed by the chair to act as a nominating committee of the officers to be elected for the ensuing term.

At this point the following guests of the Branch were introduced by President Cady:

Dr. W. D. Johnson, President of the State Society, Dr. D. S. Dougherty, Secretary of the

State Society, and Dr. John A. Card, Speaker of the House of Delegates. Each made an address outlining the policies of the Medical Society of the State of New York.

After the luncheon which followed Dr. Merriam, Chairman, presented the report of the Nominating Committee as follows:

For President, Dr. S. B. Blakely, Binghamton.

For First Vice-president, Dr. John E. Wattenberg, Cortland.

For Second Vice-president, Dr. Leo P. Larkin, Elmira.

For Secretary, Dr. H. B. Marvin, Binghamton.

For Treasurer, Dr. W. A. Moulton, Candor.

The report of the Nominating Committee was accepted in its entirety and the candidates declared elected.

Following the election of officers the scientific program was resumed and Dr. Arthur Morgan of Philadelphia, guest speaker, discussed the "Treatment of Cardiac Tragedies," in which he gave a very complete monograph of these conditions, discussing especially the management of Angina Pectoris and Coronary Occlusion.

The history, the architecture and the operation of the "Tioga County Hospital" were given by Dr. G. S. Carpenter of Waverly, who finished by issuing an invitation to all and sundry to make a call of inspection at the close of the meeting. This was taken advantage of by a large number.

GEORGE M. CADY, *President*.

April 15, 1932.

REPORT OF THE SEVENTH DISTRICT BRANCH

To the House of Delegates:
Gentlemen:

There has been very little special activity in the counties of the Seventh District Branch during the past year. However, Monroe County has continued its broadcasting program which I believe has done a great deal of good. Ontario County has been surveyed for a county health unit, but as far as I am able to ascertain nothing definite has been done along this line. Activities in the other counties have been about normal.

The annual meeting of the Branch was held at the Iola Sanitarium in Rochester on September

24, 1931. It was well attended. We were fortunate, through the efforts of Dr. T. P. Farmer of Syracuse, and the cooperation of the Monroe County Medical Society, in having with us Dr. Walter C. Albarez of the Mayo Clinic, Rochester, Minnesota. The attendance was very large at this meeting, the registry showing, I believe, the largest number attending any Seventh District Branch Meeting.

Respectfully submitted,

E. CARLTON FOSTER, *President*.

April 15, 1932.

REPORT OF THE EIGHTH DISTRICT BRANCH

To the House of Delegates:

Gentlemen:

As President of the Eighth District Branch, permit me to submit the following report of our activities during the last year.

In June we had a meeting in Buffalo of the Executive Committee and the presidents of the component county societies, for the principal purpose of outlining a program for the annual meeting. The representation was splendid, and in addition to outlining a program, we discussed a number of important medical affairs reported from the different counties.

On Thursday, October 1st, the District Branch held its Twenty-Sixth Annual Meeting at the Country Club in Olean. The attendance was most encouraging, being the largest that the district has recorded in a number of years. Every county was represented, giving a total enrollment of one

hundred and ten members, and twenty guests. At the close of the meeting the following officers for the next two years were elected:

President—Raymond B. Morris, Olean.

First Vice-President—Frederick J. Schnell, No. Tonawanda.

Second Vice-President—Henry W. Ingham, Jamestown.

Secretary—Robert P. Munson, Medina.

Treasurer—Fitch H. Van Orsdale, Belmont.

Owing to disability, I was not able to visit as many of the county societies as I should like to have done, but I have been in communication with the officers of all societies, and take pleasure in reporting that, without exception, they are actively engaged in solving their individual problems.

Respectfully submitted,

W. ROSS THOMSON, President.

Annual meeting, Hotel Statler, Buffalo, N. Y., May 23-25, 1932

PREPARATIONS FOR THE ANNUAL MEETING

This May first issue of the Journal contains the final announcements of the Annual Meeting of the Medical Society of the State of New York, to be held in Buffalo on May 23-25, 1932. The issue of April 15 contained the programs and the first installment of the annual reports of the officers and committees. This present issue completes the annual reports, and adds details of arrangements which could not be settled at an earlier date.

A surprisingly large number of members have cooperated to complete the preparations for the Annual Meeting. There are the officers and chairmen who have prepared the reports, twenty-six in number; the Committees on Scientific Work and on Arrangements have a total of twenty members whose work has extended over the greater part of last year; there are 180 participants listed on the scientific program; and 70 members of the Refer-

ence Committees who will consider the Annual Reports and the recommendations of the officers. Altogether 275 members are listed to prepare for the meeting, or about one physician in every forty members of the State Society.

This is the sixth year in which the Annual Reports have been published before the Annual Meeting and the second year in which the personnel of the Reference Committees have been announced in advance. The wisdom of this plan is demonstrated by the facility of action in the Annual Meeting. The House of Delegates, for example, has tripled its scope of

work in the past five years; and yet it requires no increase in the amount of time necessary to transact its business. The Reference Committees have nearly a month for considering the reports and recommendations of the officers; and the other members of the House of Delegates have abundant time for studying the subjects to be discussed. The business of the House of Delegates is, therefore, transacted with the maximum facility and wisdom.

The Annual Meeting this year promises to be the most extensive and satisfactory in the history of the Medical Society of the State of New York.

RADIUM POISONING

The Metropolitan papers of April first carried front page news of the death of a prominent business man of Pittsburgh from chronic poisoning by radium contained in a "water" that was widely advertised as a "rejuvenator." The newspapers of 1928 and 1929 had given equal publicity to a series of fatal cases of radium poisoning in factory workers in Newark, N. J., caused by the practice of using the lips to wet the brushes with which radio-active paint was applied to luminous dials. (See this Journal of February 1, 1929, page 177; and that of August 1, 1929, page 962.)

When the Pittsburgh case was featured in the newspapers, the editors of this Journal invited Dr. Frederick B. Flinn, head of the Department of Industrial Hygiene of the College of Physicians and Surgeons, New York City, to describe the effects of radium on the human body. The article, which was a model of brevity, clearness and completeness, was published in this Journal of April 15, 1932, page 446.

The story of the exploitation of water containing radium was printed in the Journal of the American Medical Association of April 16, 1932, page 1397. Five columns of that Journal were required to give the concise record of attempts to place alleged radiation on the market by a promotor who was sentenced to prison in 1915 for automobile frauds. The promotor then took up radiation and advertised at least seven devices for applying it to the human body. Most of these devices were probably fakes, but one, a water called radithor actually contained radium in appreciable quantities. This water was advertised to be good for a list of one hundred and sixty conditions of the human body. It was this preparation which caused the death of the Pittsburgh victim. It seems strange that the promotor should really have put radium into the water, but he also made preparations containing radium emanations and others which were inert and were frauds of the most evident type.

LOOKING BACKWARD

This Journal Twenty-Five Years Ago

Women's Medical Society: The coming meeting of the Women's Medical Society of New York State at the time of the annual meeting of the Medical Society of the State of New York recalls its founding a quarter of a century ago, as is described in this Journal of May, 1907:

"On March 11, 1907, in honor of the seventy-eighth birthday of Dr. Sarah R. Adamson Dolley, the women physicians of the State met at Rochester and organized the Women's Medical Society of New York State.

"It seems fitting that this should occur in Western New York, where the opportunities for

medical education and a medical degree were first given to women.

"Dr. Elizabeth Blackwell graduated at the Geneva Medical College, Geneva, N. Y. in 1849, and Dr. Dolley graduated at the Central Medical College of Syracuse and Rochester, in 1851.

"This Society is organized with the distinct understanding that it is not to divert interest from the Medical Society of the State of New York, but rather to encourage greater activity in organized work, and to cultivate social relations and mutual helpfulness among women physicians."

MEDICAL PROGRESS

Erythredema or Pink Disease.—A study of the records of 42 cases diagnosed as erythredema in Sydney, Australia, leads George Willcocks to believe that the diagnosis may not always be correct. It is the combination of symptoms that is important—pink feet, pink papular rash, irritability, photophobia, and other signs in the absence of any other adequate explanation. An infectious focus of some kind is almost invariably present, and gastro-intestinal disturbances are common. The disease quite often follows bronchitis, gastroenteritis, improper diet associated with ulceration about the mouth or nose, dentition, urinary infection or septic sores about the face or limbs. In 23 of the 42 cases reviewed the characteristic symptoms and signs occurred, without obvious cause for their existence, while in 19 cases there were certain possible causes for the symptoms. In some cases skiagraphy revealed the bony changes typical of rickets, but often these were absent. There is no doubt that the symptoms occur without any obvious dietetic or infectious cause, but in the present state of our knowledge these should be investigated. The prognosis of the disease is serious. The main method of treatment has been to give an adequate diet, including egg yolk, orange juice, and one-half a drachm of cod-liver oil. All infective foci should be treated, and the child should be left at rest in the fresh air as much as possible. Chloral, bromide, and Dover's powder are often given for the insomnia, which is one of the most difficult symptoms to combat. In addition 20 grains of potassium citrate may be given four times a day. The impression is that children with this disease do better at home than in a hospital. Findlay and Stern have produced a syndrome resembling pink disease in rats. They found that the condition was rapidly cured by feeding raw liver. In view of this there could be no harm in adding a small quantity of liver extract to the child's daily diet in pink disease.—*Practitioner*, January, 1932, cxxviii, 1.

Preliminary Pneumothorax in Intrathoracic Surgery.—M. J. Arcé points out that as long ago as 1924 he called attention to the possibility of opening the thorax to perform intrathoracic operations without any more difficulty than is involved in carrying out an abdominal operation. This is made practicable by the simple device of performing a preliminary pneumothorax 8, 10 or 12 days before operation, sufficient to produce total or nearly total atelectasis of the corresponding lung. One point of great importance is the making of roentgenograms before and after the

pneumothorax, in order to follow the evolution of the therapeutic process in its entirety. Nitrogen is the gas of choice; air is undesirable because it is resorbed too rapidly. From 300 to 500 c.c. are injected on the first occasion, according to the tolerance of the patient, with care to pause after 200 c.c. have been injected in case the patient has a tendency to cough or has difficulty in respiration. In the course of three insufflations a total of 1500 to 2000 c.c. generally suffices. When atelectasis has been attained, the second roentgenogram is taken. When the case is one of tumors of the lung, particularly hydatid cysts, it is easily understood that the atelectasis will never be quite complete, and that small portions of the lung will still be full of air around the tumor. When the affection is not one of the lung, but of the mediastinum or diaphragm, the complete atelectasis of the lung and the greater transparency of the insufflated hemithorax will make it possible to clear up the diagnosis in a manner often astonishing. If under these conditions the surgeon does a thoracotomy he finds the patient in a state of absolute tolerance at the moment when he incises the pleura, and no matter how sudden the opening no modification is observed of either pulse or respiration. To produce any sign of disturbance one must irritate the pleura, make traction on the lung, or, if it is a hydatid cyst, irritate the bronchioles by intracystic maneuvers after the cyst is opened; the response is then usually a cough, a slight sense of oppression, or more or less dyspnea; when a pneumotomy is done, bloody expectoration may be produced. To assure success of the operation, the collapse must be maintained; when exploration is completed, this is accomplished by covering the lung with gauze compresses wrung out in warm artificial serum, upon which an assistant makes pressure to keep them in situ. There is always a slight effusion afterwards, which however gives no trouble. The patient should be fluoroscoped at least once in 4 days afterward. Arcé has had remarkably good results in all the 50 and more operations that he has carried out.—*Bulletin de l'Académie de Médecine*, February 9, 1932.

Relation of Cancer of the Skin and Skin Appendages to Focal Lesions in Other Ectodermal Structures.—Montrose T. Burrows, writing in the *Southern Medical Journal*, February, 1932, xxv, 2, discusses the possibility that cancer may be a reaction secondary to other forms of deterioration. In the production of coal tar cancer it has been noted that cancerous degeneration does not take place at once, but always after the

systemic changes have become noticeable. This suggests that systemic changes may be as important as local irritation. To throw light on this hypothesis, the author made a study, published in 1929, which showed that in every cancer case there were other degenerative states any one of which, regardless of the cancer, might have caused cachexia or general deteriorations from which the subjects were suffering. It was found that patients with cancers of the skin, breasts, and lips had also abscessed teeth, chronic tonsillitis, chronic nerve lesions, or diabetes. The treatment of these secondary lesions along with the cancers gave not only excellent results in many cases, but cancers of the skin disappeared spontaneously and in several instances breast metastases were no longer noticed after careful removal of all the diseased teeth. Abscessed teeth were not found associated with cancer of other tissues and organs. In a more recent study, including 172 cases of skin cancer and 68 breast cancers, lesions of the teeth or other degenerations in the skin or nerves were found in every case except one of breast cancer. The study further showed a degeneration in the ectoderm in each case of cancer of the skin and its appendages. The same ectodermal lesions were not found in cases of cancer of other organs and tissues. A series of 43 patients with cancer of the skin or its appendages, who had toothless mouths, were submitted to careful x-ray examination. In all but three instances the toothless mouths showed root fragments, and a visible pus pocket surrounded most of them. No evidence has been found that tonsils act directly to cause malignant degeneration of the skin or its appendages. It is possible, however, that they play a rôle in localizing the cancer. In many cases of cancer about the nose chronically diseased tonsils have been present, and the cancers have developed on that side of the nose corresponding to the most diseased of the two tonsils. It has been noticed in cases of cancer of the skin and its appendages that malignancy has in no instance developed until after the appearance of cachexia associated with abscessed teeth or similar conditions. On the other hand, cancers have developed after cachexia on sites which have suffered previous irritation. It seems that cancer may depend not only on a specific form of local irritation, but also on the immediate metabolic state of the individual.

Arterial Atony and Arteriosclerosis.—J. Plesch holds that arteriosclerosis is only one phenomenon in a constitutional systemic disease affecting more particularly unstriated muscle. It is by no means restricted to local areas; it attacks the whole vascular system simultaneously. It is a disease that sets in at every age, that can be arrested, that can be cured in the early stages and beneficially influenced in the later stages. Two forms of the disease can be distinguished:

(1) The arteriosclerosis of old age, due to wear and tear, with its local atheromatous calcified areas as secondary mechanical hysteresis, and (2) arteriosclerosis as a constitutional, systemic, allergic primary affection of the smooth muscles, the sympathetic nerves and the connective tissues. The essential characteristic is not deposition of lime. The primary cause is the weakening of the elastic elements of the blood-vessel walls. The author's investigations have shown that the attenuation of the blood-vessel walls corresponds to their atonic state. Every influence that is capable of weakening the organism to such an extent as to produce a general atony can also be held responsible for arterial atony and for calcification. The clinical symptoms of arteriosclerosis can be explained on the basis of arterial atony. Plesch points out that in the early stages of arteriosclerosis both high and low blood pressures can be found. The important factor is not so much the absolute blood pressure as its extraordinary instability. The changes in the vascular system affect the heart's capacity for work, resulting in the so-called oppressive feeling or in angina pectoris. The prophylaxis and treatment of atony in its early stages consist chiefly in removing as far as possible the injurious etiological elements. The over-taxed circulation must be relieved by absolute rest in the horizontal position. The physician who is determined to reduce the blood pressure by force, without first combating its causes, commits malpractice. He should not work against compensation, but rather direct it. Still less rational are remedies to "loosen the lime in the arteries." It is important that the volume of blood be reduced. It is possible to do this far more effectively by dieting and fresh air than by blood-letting. It is practicable to repeat the nitrogen-free and salt free diet every year for three or four weeks, and to introduce a "dietetic day" once a week to relieve the vascular system. The idea of digitalis at all costs is objectionable. The prolonged administration of iodide of potassium is injurious rather than useful. Where arteriocapillary fibrosis has already developed, this drug may be given in doses up to 8 grams daily for ten days, and repeated at intervals of ten days. For meteorism tincture of asa-fetida, about 15 drops before meals, is effective. —*The Lancet*, February 20, 1932, cccxii, 5660.

Arteriosclerosis.—Wesley Scott quotes statistics which show a mounting incidence of arteriosclerosis, particularly in middle life. But we are reminded of the fact that individuals are living longer than ever before and deterioration of the arteries seems to be nature's method of eliminating us after our biological responsibilities have been fulfilled. Complicating the problem are our present day efforts to thwart the law of natural selection. The pathogenesis of the disease is an unsolved problem. The clinical and pathological

problems involved are most perplexing. The changes in the arterial tree that we call arteriosclerosis are most capricious in their distribution, appearing in the greater circulation from the sinus of Valsalva to the smallest arterioles. The process may be generalized in some instances and sharply localized in others. The functional significance of arteriosclerosis varies greatly. Extensive changes in the large arteries may offer no barrier to longevity, and on the other hand, the process may be confined to a few millimeters of the coronary artery and cause sudden death in the prime of life. Serious damage to the intimate vasculature of the kidney is found in young people dying of uremia. Scott cites a case of extensive and severe diffuse vascular disease with hypertension and death from cerebral hemorrhage in a boy of 12 years. As a basis for discussion in correlating the clinical and pathological findings he offers a classification under two headings: (1) Arteriosclerosis (large arteries) without hypertension, and (2) arteriosclerosis (arterioles) with hypertension. He then points out defects in this scheme, since a number of conditions, such as myocardial insufficiency, coronary disease, angina pectoris, apoplexy, and paralysis appear under both headings. Arteriosclerosis and hypertension are associated because most individuals with so-called hypertension show at post mortem more or less marked lesions of the arterioles. The occurrence of large vessel sclerosis without hypertension is also open to criticism because of the frequent involvement of the arteries as well as the arterioles in individuals with hypertension. The cause of death in individuals with hypertension is, in the order of frequency, heart failure, a cerebral accident, and renal insufficiency. In a series of 100 cases of hypertension coming to autopsy Scott found as the cause of death myocardial failure in 68 per cent, cerebral accident in 22 per cent, and renal insufficiency in 10 per cent. From 85 to 90 per cent of patients with hypertension and arteriosclerosis die of heart failure or a cerebral accident before the vascular lesion in the kidney progresses to the point of renal insufficiency. These facts are not as widely appreciated as their significance merits. When we know more of the causes of hypertension we shall be further on the road to the solution of the problem of arteriosclerosis.—*American Heart Journal*, February, 1932, vii, 3.

Spontaneous Pneumothorax Under the Form of Perforated Ulcus Ventriculi.—According to M. Siebner, certain affections of the lungs, which are attended with laceration or breaking down of cortical lung parenchyma, may produce a spontaneous pneumothorax. Among those that have this tendency in peculiar degree are those acute cases of phthisis which go hand in hand with rapid destruction of tissue, in which tuberculous caverns lie near the surface of the

lung and break through into the pleural cavity, whereas the fibrous forms with chronic course relatively seldom show this behavior. Siebner had a case in which without any preceding pulmonary disease or any external cause a spontaneous pneumothorax appeared, to the extreme astonishment of physician and patient alike. A healthy man of 32 while traveling to his work was suddenly seized with pains in the region of the stomach and left shoulder, accompanied by nausea. He was taken to the hospital in a state of shock, and his symptoms on admission were such as to suggest perforation of an ulcer ventriculi. Laparotomy, however, showed no pathological findings in the stomach or any other abdominal organ. On the following day the first signs of a left-sided pneumothorax were established by percussion and auscultation. There was no air hunger, and no rigidity of the abdomen; the temperature was normal. During the next 8 days a complete pneumothorax of the left side was diagnosed roentgenologically. Recovery ran a perfectly normal course, and at the end of 3 weeks there remained only a very slight collection of air with a small amount of exudate over the diaphragm, but neither fever nor cough. Sputum examination was negative. The patient is still under observation for tuberculosis, but no active lung process has been demonstrated. One may suppose that a small cavity near the wall or an emphysematous vesicle in the wall ruptured into the left pleural cavity and then established a communication with the external air by way of a bronchial branch. In the moment of rupture there was an excitation of the intercostal nerves, and pain and rigidity of the abdominal wall appeared at a time when the lung was still expanded; also only a little air could find its way in between the bronchial tube and the pleural cavity, so that at first the pneumothorax could not be recognized even roentgenologically. The irradiation of the pain to the intercostal nerves caused pain in the upper part of the abdomen, presenting the picture of *ulcus ventriculi*.—*Deutsche medizinische Wochenschrift*, February 12, 1932.

Hypertension and the Kidney.—A report is made by Max Rosenberg in the *Deutsche medizinische Wochenschrift* of February 5, 1932, with reference to the conditions of blood pressure in 22 patients with renal affections, 14 of whom were suffering with hydronephrotic or pyelogenic contracted kidney, 5 with cystic kidneys, and 3 with renal tuberculosis, and in all of them the condition led to a fatal termination, due to azotemic uremia. One of the patients with contracted kidney was found at autopsy to have been affected also with chronic glomerulonephritis, and another with arteriosclerosis; both of these exhibited cardiac hypertrophy and a hypertonia respectively of 195/120 (age 23) and of 165/95

(age 62), so that it is not clear whether the hypertonia and cardiac hypertrophy must be attributed to the contracted kidney through ascending infection or to the hypertonic effect of the vascular disease. The 3 tuberculous cases had a blood pressure between 110 and 135 mm. Hg (ages 21-46), and at autopsy there was either a dilated or a small brown-atrophic heart, in no case an hypertrophy. Of the 5 patients with cystic kidney, 2 women of ages 49 and 44 had no hypertrophy, blood pressure 130 and 145 mm. Hg respectively; a man aged 53 had maximal blood pressure 170 mm. Hg and considerable hypertrophy; a woman of 45, blood pressure 160 mm. Hg and no hypertrophy; and a man of 55, moribund when admitted, had sclerosis of the coronary arteries and a huge dilatation and hypertrophy of the left ventricle. The author concludes that high grade contractions or destructions of the kidney with fatal termination through uremia, and due to ascending infection (pyelonephritis), chronic urinary stasis (hydro- or pyonephrosis), tuberculosis, or cystic degeneration of both kidneys, much less frequently cause high blood pressure and cardiac hypertrophy than contracted kidneys resulting from chronic nephritis or primary disease of the vessels (malignant nephrosclerosis). This is of diagnostic significance in view of the fact that renal insufficiency without hypertonia or cardiac hypertrophy must always suggest the diagnosis of such diseases (including amyloid). The theoretical significance of these observations lies in the fact that they make it seem unlikely that the increased blood pressure has a mechanical origin, in an insufficient irrigation of the kidney with blood, and presuppose rather a chemical origin, namely, that both groups of kidney insufficiency are caused by quantitative and probably also qualitative differences in the formation of chemical substances having a pressor effect.

Oleothorax in Chronic Non-Infectious Pleural Effusions.—Walter Baumgarten and Howard A. Rusk report two cases of non-infectious pleural effusion in which, after the injection of gomenol, fluid ceased to accumulate, and there had been no further effusion. Both of the patients were elderly women with heart disease. In the one the pleural effusion followed an attack of bronchopneumonia and in the other it was due to malignant metastases in the pleura following a radical breast operation. Heretofore, oleothorax has been used chiefly as a means of compression in cases of tuberculous and infectious pleurisy to prevent adhesions and permit collapse. The technique employed in the two types of cases is quite different, and upon this difference depends the difference in results. In tuberculous pleurisy a portion of the effusion is withdrawn, then oil is injected and reinjected in large amounts, replacing the infected fluid with an oil emulsion of

gradually increasing strength. In the authors' cases as much of the fluid as was possible was withdrawn at each aspiration and the oil was re-injected so that each time the chest was tapped there was a marked increase in the strength of the emulsion and a diminution of the amount. For example, in the first case, one-half of the fluid on the right side was withdrawn and 10 c.c. of 3 per cent gomenol in olive oil were slowly injected. Two days later the same amount of fluid was withdrawn and 30 c.c. of oil were injected. The amount was rapidly increased at two-day intervals until at the fifth injection as much of the fluid as possible was withdrawn and replaced by 250 c.c. of oil. On the basis of their animal experiments, the authors believe that in a simple serous effusion the medicated oil sets up an irritative pleurisy, which is followed by adhesions, with an obliteration of the pleural cavity. This is in direct contrast to the results in the treatment of tuberculous and infectious pleurisy, where the oil is used to prevent adhesions and permit collapse.—*Southern Medical Journal*, March, 1932, xxv, 3.

Winter Sun Cure at Home.—Many physicians, says E. Schott, fail to utilize means close at hand in the case of patients for whom a stay at a winter cure in a high mountain climate is an absolute impossibility. It is not a question of a substitute, but of doing nothing, of letting matters slide, or of taking advantage of such sunshine as lower climates afford, which is not to be despised. There is no need of a long journey, strange surroundings and manners, a strange bed, and a parting from home. All that is needed is a chaise longue, or, failing that, any comfortable chair, such as even a man out of work possesses, together with warm covers for his legs and a pillow at his back. Anyone can find a corner protected from the wind. The winter sun is only waiting to have its beams sought for. It is a mistake for anyone to suppose that there is no winter sunshine in his own climate. There is sunshine everywhere, and in all months of the year. But one must give attention to it, seek it, and take time for it. Everyone has time enough for the thing he really needs, and most of all the sick man! Hours spent in the winter sunshine of one's own home town, with the body in a comfortable reclining position, and well protected from the wind, will accomplish almost the same results as that of the high resorts, the latter in 5 hours, the former in ten, or perhaps a little more. One or two weeks after the high mountain cure is ended, and the patient back at work, its effect is over. To be able to renew the stimulation over and over again in smaller doses is much better. Warm sunshine in the middle of the day in winter is common. Even schoolchildren know the tonic effect of tanning of the face and shoulders. In addition, the psychic effect of a healthy, brown face is not to be despised.—*Münchener medizinische Wochenschrift*, February 26, 1932.

LEGAL

LEGAL LIABILITY OF EMPLOYER FOR THE ACTS OF A PHYSICIAN EMPLOYEE

By LORENZ J. BROSNAN, ESQ.
Counsel, Medical Society of the State of New York

A variety of cases have arisen in the courts involving the question of legal liability on the part of individuals or corporations who employ physicians to administer medical care and treatment to third parties. It is, of course, the rule that a doctor is personally responsible to the patients treated by him and is answerable in money damages to such patients if malpractice is established. There, however, have been a number of cases where the patient has sued the employer of the physician and not the physician himself. In these cases no doubt, the plaintiff felt that the individual or corporate defendant was financially able to respond to a judgment, whereas the physician might not be. It may be of interest to the medical profession to discuss some of the cases involving these propositions.

Some years ago the point arose in a very interesting case which was taken on appeal to the highest court of this State. In that case a passenger on a ship at sea, fell on the deck and fractured her knee-cap. The ship-surgeon, who was under salary from the steamship company, treated her, but after she landed it became necessary to amputate the leg. The passenger sued the company for damages arising out of alleged negligence. It was held by the Court of Appeals that in the absence of evidence of carelessness on the part of the company in the selection of its doctor it could not be held liable for his negligence. In its opinion the court stated in part:

"If, by law or by choice, the defendant was bound to provide a surgeon for its ships, its duty to the passengers was to select a reasonably competent man for that office, and it is liable only for a neglect of that duty. . . . It is responsible solely for its own negligence and not for that of the surgeon employed. In performing such duty it is bound only to the exercise of reasonable care and diligence and is not compelled to select and employ the highest skill and longest experience. There was no evidence in this case that the defendant was careless or negligent in its choice. The surgeon had been upon the Rotterdam Line for three years, and so far as appears, was reasonably competent for his duty. If in plaintiff's case he erred in his treatment, it does not prove that he was incompetent, or that it was negligence to appoint him."

Under a statute requiring a passenger ship to carry a duly qualified medical practitioner, and

to carry a supply of medicines to be used at his direction and under his charge, it has been held that the ship company assumed no liability for the malpractice of its doctor so employed. In ruling upon such a case the Court of Appeals said:

"When the shipowner has employed a competent physician duly qualified as required by the law, and has placed in his charge a supply of medicines sufficient in quantity and quality for the purposes required, which meet the approval of the government officials, and has furnished to the physician a proper place in which to keep them, we think it has performed its duty to its passengers. That from that time the responsible person is the physician, and errors and mistakes occurring in the use of the medicines are not chargeable to the shipowner, and that no different rule is applicable to such mistakes as are the result of improper arrangement in the care of the medicines than to those which are the result of errors in judgment."

A similar case came up before a Federal Judge where the plaintiff had been riding on a railway train, and was injured in a collision. His collar bone was broken, and was set by a surgeon in the employ of the railroad. He was under the doctor's care in a hospital for 19 days and at the end of that time he was discharged as cured, and told that the injured shoulder was as good as the other one. A few days later his family physician found that there was no bony union. The plaintiff's recovery was a slow one and he sued the railroad charging it with negligence. The court stated the rule as follows:

"It must be remembered that the company is not obliged to engage the very highest and best talent that can be engaged, but it must engage a man who is reasonably competent in his profession, so that he would be an ordinarily competent man, having ordinary knowledge and skill to perform the duties placed upon him. These are the duties that are assumed by the company. A competent man being in the employ of the company, his services are offered by the company to attend to the injured party. The person that it injured is not compelled to accept his services; he may prefer to go elsewhere. There is a difference between a person whose services are offered that may or may not be accepted, and a con-

ductor or brakeman that are put on the train and whose services we must accept. When a man goes upon a train he has no choice about the conductor, brakeman or anything else. The company assumes that they are responsible for the performance of their duty in such respects. But with regard to a surgeon of that character, the plaintiff could have refused to take him as his surgeon, and could have taken any other surgeon, as he deemed it best to do. So that, as I have instructed you, the duty of the company is performed, and it has performed all that the law requires, when it furnishes a competent man, and he is ordinarily competent for that duty."

Similarly it has been held that where a great business corporation maintains a hospital for the free treatment of its employees, supported partly by the company, and in small part by monthly contributions from all of the employees, the company cannot be held to liability for acts of negligence on the part of the physicians and attendants at said hospital, provided it used care in selecting such doctors and attendants. In an opinion so holding, the court well stated the rule as follows:

"Was the Company liable for the malpractice of the physicians or the carelessness of the attendants, at the hospital, if that hospital was maintained as a charitable enterprise and not for the purpose of deriving profit from it? If one contracts to treat a patient in a hospital, or out of it, for that matter, for any disease or injury, he undoubtedly becomes liable for any injury suffered by the patient through the carelessness of the physicians or attendants he employs to carry out his contract. If one undertakes to treat such a patient for the purpose of making profit thereby, the law implies the contract to treat him carefully and skillfully and holds him liable for the carelessness of the physicians and attendants he furnishes. But, this doctrine of *respondeat superior* has no just application where one voluntarily aids in establishing or maintaining a hospital without expectation of pecuniary profit. If one, out of charity, with no purpose of making profit, sends a physician to a sick neighbor, or to an injured servant, or furnishes him with hospital accommodations and medical attendance, he is not liable for the carelessness of the physicians or of the attendants. The doctrine of *respondeat superior* no longer applies because by fair implication, he simply undertakes to exercise ordinary care in the selection of physicians and attendants who are reasonably competent and skillful, and does not agree to become personally responsible for their negligence or mistakes.

"The same rule applies to corporations and to individuals, whether they are engaged in dispensing their own charities or in dispensing the charitable gifts of others entrusted to them to administer. . . . Moreover, the corporations or individuals that administer such trusts must, after all,

leave the treatment of the patients to the superior knowledge and skill of the physicians. They cannot direct the latter, as the master may ordinarily direct the servant, what to do, and how to do it. If they did so, the physicians would be bound to exercise their own superior skill and general judgment and to disobey their employers if, in their opinion, the welfare of the patients required it and finally, the patient is not required to accept the proffered accommodations and attendance. They are but freely offered to him. He may refuse to accept them, and seek other physicians and other accommodations.

"It would be a hard rule indeed, a rule calculated to repress the charitable instincts of men, that would compel those who have freely furnished such accommodations and services to pay for the negligence or mistakes of physicians or attendants that they had selected with reasonable care. No such rule has ever prevailed in this country. The rule is that those who furnish hospital accommodations and medical attendance, not for the purpose of making profit thereby, but out of charity, or in the course of the administration of a charitable enterprise are not liable for the malpractice of the physicians or the negligence of the attendants they employ, but are responsible only for their own want of ordinary care in selecting them."

A fairly recent case in this State brought against a railroad, however, is illustrative of the sort of situation in which the law will hold the employer liable. The railroad had established an emergency hospital, to which it required all injured employees should be taken. The plaintiff received a severe injury to his leg while at work, and was taken to the emergency hospital for treatment. The doctor whose duty it was to be there had not arrived, and an assistant station master delayed sending him to another hospital, so that he was allowed to remain at the emergency hospital for over an hour without treatment or relief. When finally taken to a hospital his leg was amputated, and on the trial of his damage suit there was testimony that the delay deprived him of a chance to save the leg. The Appellate Court affirmed a judgment for the injured employee, stating that the liability did not rest upon negligence in caring for the plaintiff, but upon negligence of the company in failing to provide any care at all to the plaintiff for an unreasonable length of time, the company having undertaken to provide medical and surgical care to its employees.

These adjudications are not only good law, but good common sense as well. Obviously, the law should not cast upon the employer any greater duty than reasonable care in the selection of the physician employed. To rule otherwise would be to place an onerous and unjust burden upon the employer.

NEWS NOTES

THE ANNUAL MEETING

The one hundred and twenty-sixth Annual Meeting of the Medical Society of the State of New York will be held on Monday, Tuesday, and Wednesday, May 23-25, 1932, in the Hotel Statler, Buffalo, N. Y. The major features of the meeting will be as follows:

The House of Delegates will meet on the afternoon of Monday, May twenty-third, at two o'clock, daylight saving time. Following the excellent custom of the last few years the members will dine together soon after six o'clock, and the House will remain in session throughout the evening. A session will also be held on Tuesday morning.

General scientific sessions will be held on the afternoons of both Tuesday and Wednesday, and the subjects to be discussed will be of practical value to every physician, be he a family doctor or a specialist.

The eight *scientific sections* will hold their meetings on the mornings of Tuesday and Wednesday.

The *Annual or Anniversary meeting* required by the Charter of the Medical Society of the State of New York, will be held on the evening of

Tuesday, in connection with the *Annual Banquet*. The President's address will be given by Dr. W. D. Johnson, and the inaugural address of the incoming President will be delivered by Dr. Charles Gordon Heyd.

A scientific exhibit will be open during the entire time of the annual meeting. Demonstrators will be in attendance to explain the exhibits.

Clinics will be held in several hospitals of Buffalo throughout the day on Monday, May twenty-third. Please note that these clinics are to be held in Buffalo, and not in Albany, as was announced on page 462 of the *Journal* of April 15, through an oversight.

Technical exhibits will be conducted by dealers in medical wares throughout the three days of the annual meeting. Every physician is interested in the wares which he uses in the practice of medicine, and will find them in great variety at the exhibit booths which will be located on the mezzanine floor. Nearly all the exhibitors are also advertisers in the *Journal* and are all-the-year supporters of the Medical Society of the State of New York; and their demonstrations will be of scientific value.

THE COMMITTEE ON ARRANGEMENTS

The smoothness of the meetings and exhibits, and the comfort of the members and guests at the Annual Meeting are dependent largely on the efficiency of the Committee on Arrangements,

which supervises all the local facilities. This Committee consists of:

Dr. Herbert A. Smith,	Dr. C. H. Mackey
Chairman	Dr. Milton G. Potter
Dr. L. E. Villiaume	Dr. William F. Jacobs
Dr. Nelson G. Russell	Dr. Frank N. Potts
Dr. Robert P. Dobbie	Dr. James E. King

This Committee has made provision that practically every feature of the Annual Meeting shall be held in the Hotel Statler, at Delaware Avenue and Niagara Square. This hotel has 1100 rooms, every one equipped with a private bath, circulating ice-water, a bed-head reading lamp, and a radio set. The room rates per day are from \$3.50 upwards.

The local committee is especially desirous that the golfing doctor enjoy many of the excellent courses in Buffalo and vicinity during the State Meeting, May 23rd to 25th. Courtesy guest cards will be issued at the Hotel Statler. At this time an effort will be made to promote a one-day handicap tournament. Those interested, ad-

HOTEL STATLER, BUFFALO, N. Y.

dress communications to the Chairman of the Sub-committee on Golf of the Local Committee on Arrangements, Dr. Leon H. Smith, 606 Genesee Street, Buffalo, N. Y.

The Committee on Ladies' Entertainment has completed arrangements for a reception and luncheon to be held at the exclusive Garret Club of Buffalo, on Tuesday, May 24th. On Wednesday there will be a trip to points of interest

around Buffalo, including Niagara Falls and Old Fort Niagara which has recently been restored to its original state and is one of the landmarks in the history of the Niagara Frontier. Luncheon will be had en route. Transportation for these trips will be provided. A headquarters will be established on the Mezzanine floor of the Hotel Statler, and the visiting ladies are invited to register on arrival to facilitate the arrangements.

PROPOSED RESOLUTION

In accordance with the action of the House of Delegates on June 1, 1931, Dr. Julius Ferber of New York County, gives notice that he will propose the following resolution in the House of Delegates on May 23, 1932:

"Resolved, that the Medical Society of the

State of New York through its proper officials, appoint a committee to make a thorough study of the medical aspects of the 'Workmen's Compensation Act,' and bring in concrete suggestions for the purpose and to the end of improving the present unsatisfactory situation."

WOMEN'S MEDICAL SOCIETY OF NEW YORK STATE

The winter meeting of the Councillors of the Women's Medical Society of New York State was held in Syracuse on March fifth with thirteen members present. It was decided to hold the annual meeting in Buffalo, on May 23, at the time of the meeting of the Medical Society of the State of New York. A feature of the meeting will be a medical pageant.

The tentative program of the Annual Meeting is as follows:

Greetings from the Medical Society of the

State of New York, William D. Johnson, M.D., President.

Women in Medicine, Louise Beamis-Hood, M.D., Buffalo.

Cardiological Research, Jane Sands Robb, M.D., Syracuse.

Cancer of the Spine, M. Louise Hurrell, M.D., Rochester.

Paper: Beatrice R. Rossell, M.D., Buffalo.

Paper: Margaret Warwick, M.D., Buffalo.

SOPHY PAGE CARLUCCI, *Secretary*.

AN EXPLANATION AND AN APOLOGY

April 16, 1932.

Dr. Orrin S. Wightman, Editor-in-Chief,
NEW YORK STATE JOURNAL OF MEDICINE,
7 East 88th Street,
New York, N. Y.

My dear Dr. Wightman:

The Executive Committee at a meeting held on Thursday, April 14th, 1932, passed the following resolution:

Resolved, that the Executive Committee acting as a Publication Committee hereby instructs the Editor-in-Chief to publish the following report in the May 1st, 1932, issue of the NEW YORK STATE JOURNAL OF MEDICINE.

Your Committee appointed to consider the matter of the publication of an article entitled, "A Brief Review of the Physiology of the Gall

Bladder" by Lester Levyn, M.D., which appeared in the NEW YORK STATE JOURNAL OF MEDICINE, Vol. 32, No. 2, January 15, 1932, has compared said article with "Problems in Normal and in Abnormal Physiology of the Gall Bladder" by Lester R. Whitaker, M. D., reprinted from the Archives of Surgery, April 1929, Vol. 18, pp. 1783-1802 and have reached the following conclusion:

That the article of Dr. Levyn as published in the NEW YORK STATE JOURNAL OF MEDICINE demonstrates without any doubt in the minds of the Committee the following:

1. An absolute lifting of paragraphs and sentences in exact words and construction from Dr. Whitaker's paper.

2. The utilization of references occurring in

Dr Whitaker's paper without citing Dr Whitaker's authorship

3 In general presentation and form Dr Levyn's article would seem to be almost a literal abstract of Dr Whitaker's previous publication

Your Committee therefore recommends that public apology should be made to Dr Whitaker and the Editor of the Archives of Surgery, and also that the members of the Medical Society of the State of New York and other readers of the Journal may be informed of this evident

plagiarism by the publication of this report in the NEW YORK STATE JOURNAL OF MEDICINE

ARTHUR J BFDLL, *Chairman*,
CHARLES GORDON HEYD,
FREDERIC E SONDRIN

Yours very truly,

D S DOUGHERTY, *Secretary*

The article to which reference is made was a paper read before the Section on Medicine on June 2 1931 at the Annual Meeting of the Medical Society of the State of New York It came to the editors through the regular channels of the section officers and was published in accordance with section 89 of the By laws of the State Society—*Editor's Note*

PUBLIC HEALTH LABORATORIES ASSOCIATION

The New York State Association of Public Health Laboratories is to hold its sixteenth annual meeting in Alumni Hall, School of Medicine, University of Buffalo, on Monday morning, May 23, at 9 30 o'clock The program consists of the following papers

Studies on the autounnary test in the diagnosis of tuberculosis (A preliminary report) Ernest B Hanan, Sophia Zurett and (by invitation) Clifford Orr and Helen Walker, Buffalo City Hospital Laboratories Buffalo

Cotton guard rope in swimming pools as a source of the colon aerogenes group Harold W Leahy, Health Bureau Laboratories, Rochester

A summary and analysis of the replies to the

Association's questionnaire George M MacKenzie, Otsego County Laboratory, Coopers-town

The practical value of antipneumococcus, antimeningococcus and antistreptococcus sera in the treatment of pneumonia, meningitis, scarlet fever and other streptococcus infections Augustus B Wadsworth, State Laboratory, Albany.

Pathological diagnoses at the State Institute for the Study of Malignant Disease Alphonse A Thibaudeau (by invitation), State Institute for the Study of Malignant Disease, Buffalo

Laboratory diagnosis of psittacosis in birds and human beings Thomas M Rivers (by invitation), The Hospital of the Rockefeller Institute for Medical Research, New York City

SPECIAL CARS TO A M A MEETING

President Johnson has appointed Drs John A Card, of Poughkeepsie, and Arthur W Booth, of Elmira a Transportation Committee for the benefit of those attending the American Medical Association meeting in New Orleans, beginning May 9, 1932

The Committee has arranged for the New York delegation to leave New York on the Pennsylv

vania Railroad, Saturday, May 7, 1932, at 8 10 A M, Eastern Standard Time, arriving in New Orleans Sunday evening

Several Pullman cars have been placed at the disposal of the Committee and tentative reservations for drawing rooms, compartments, or berths may be made by applying to Dr John A Card, Poughkeepsie N Y

SULLIVAN COUNTY

A special meeting of the Medical Society of the County of Sullivan was held on Thursday, March 24, at the Loomis Sanatorium to commemorate the 50th anniversary of the discovery of the Tubercle Bacillus by Dr Robert Koch The importance of this great discovery was very ably brought out by Dr J Burns Amberson, Jr, in an excellent talk on "The Significance of the Work of Dr Robert Koch" Dr Amberson, a former president of the Sullivan County Medical Society is at present professor of Clinical Medicine at Columbia University, and a visiting Physician to the Tuberculosis Service at the Bellevue

Hospital, New York City A microscopic demonstration of the Tubercle Bacilli following the original technique of Dr Koch compared with the more modern technique was exhibited by Dr J S Woolley of the Loomis staff

As a souvenir of the occasion everyone present at the meeting received a beautifully bound copy of a translation of Koch's original article

There were forty in attendance, and all were guests of the Loomis Sanatorium at an excellent collation which was served after the meeting

HARRY GORMAN, M D
Chairman Publicity Committee

BOOK REVIEWS

SURGICAL PATHOLOGY OF THE DISEASES OF BONES. By ARTHUR E. HERTZLER, M.D. Octavo of 272 pages, illustrated. Philadelphia, J. B. Lippincott Company, [c.1931]. Cloth, \$5.00 (Hertzler's Monographs on Surgical Pathology.)

SURGICAL PATHOLOGY OF THE SKIN, FASCIA, MUSCLES, TENDONS, BLOOD AND LYMPH VESSELS. By ARTHUR E. HERTZLER, M.D. Octavo of 301 pages, illustrated. Philadelphia, J. B. Lippincott Company, [c.1931]. Cloth, \$5.00. (Hertzler's Monographs on Surgical Pathology.)

These two small volumes represent the beginning of a series of monographs on Surgical Pathology. The objective arrived at by the author, is the presentation of the surgical pathology of various systems, organs and tissues, in a concise, systematic and orderly manner from the surgical point of view, founded on an experience of some thirty years. Review of the volumes reveals an astonishing wealth of information regarding many conditions which are considered of minor importance and therefore neglected in other works. They cover their subjects comprehensively and with an unusual lucidity of expression. The style is entertaining and a certain amount of dogmatism emphasizes the author's points of view. The books are abundantly and excellently illustrated so that more attention perhaps is paid to visual transmission of the appearance of the lesion than to verbal description; a condition which enhances the importance of the works. Both volumes can be heartily recommended to every surgeon and surgical pathologist. To both, as well as to the teacher of surgical pathology, they will prove of inestimable value.

MAX LEDERER.

CRITERIA FOR THE INTERPRETATION OF ELECTROCARDIOGRAMS. Prepared with the aid of the Committee on Research of the Heart Committee by ARTHUR C. DE GRAFF, M.D. 12mo of 13 pages, illustrated. New York, New York Tuberculosis and Health Association, Inc., 1931. Paper, 35c.

This little book is an attempt to classify the alterations of cardiac rhythm met with in a study of electrocardiographic tracings. It serves a useful purpose in that it provides a standard nomenclature. It is not a key to the interpretation of the electrocardiogram as it does not stress the fundamental principles that govern the interpretation of the electric curves.

SIMON FRUCHT.

ESSENTIALS OF PSYCHIATRY. By GEORGE W. HENRY, A.B., M.D. Second edition. Octavo of 304 pages. Baltimore, The Williams & Wilkins Company, 1931. Cloth, \$4.00.

This, the second edition, is a moderate-sized and conveniently arranged volume of 304 pages.

The first two chapters deal respectively with personality development and personality disorder in a way that gives one insight into why and how the human being may develop susceptibility to mental aberrations. Then, after a discussion of the various types of mental reaction with the appropriate mental and nursing care, the very important matter of prevention is dealt with and the reader gets an idea of the fundamental importance of a knowledge of psycho-pathology and mental hygiene and must soon realize, whether or not he has acquired any previous knowledge, the importance of early and proper child guidance. The wisdom of studying a patient from all

angles is well shown by the author's experience with general hospital cases. There is an interesting chapter on the history of psychiatry.

The book is written in a way to hold the interest of the reader and to stimulate further reading, and if he will take up the collateral reading suggested in the bibliography, he will, without doubt, acquire very ample information on psychiatry and allied subjects. It is highly recommended as an aid to physicians and nurses, whether or not they specialize in the care of mental cases, and to all others who are interested in social work and mental hygiene.

A. E. SOPER.

HOW'S YOUR BLOOD PRESSURE? By CLARENCE L. ANDREWS, M.D. Octavo of 225 pages. New York, The Macmillan Company, 1931. Cloth, \$2.50.

This is a book for the patient with abnormal blood pressure, written in a style that the layman can understand. There is an explanation of the circulation of the blood, a discussion of what is normal blood pressure and high and low pressure with the probable causes. The effects of exercise, work, worry, food, sex problems and matrimony are discussed. The author attempts to show how many disturbances in blood pressure that begin in early life may be avoided and to give to the patient a clearer and better understanding of blood pressure in its relation to health.

Books of this type, though not very interesting reading for the physician, may be used to serve a useful purpose in dealing with the intelligent and curious patient who wants to go into details. The author writes well and expresses standard ideas.

W. E. MCCOLLOM.

PREPARATION OF SCIENTIFIC AND TECHNICAL PAPERS. By SAM F. TRELEASE and EMMA SAREPTA YULE. Second edition. 12mo of 117 pages. Baltimore, The Williams & Wilkins Company, 1930. Cloth, \$1.50.

Designed primarily as a reference book for university and normal school students who desire information regarding matters of style, this manual presents many helpful suggestions for those writing articles on scientific or technical subjects.

The book contains valuable tables, abbreviations, styles of type, and many rules that are based upon recognized authorities, all of which should enable the student to present his material more effectively.

FREDERIC DAMRAU.

THE GREAT PHYSICIAN. A Short Life of Sir William Osler. By EDITH GITTINGS REID. Octavo of 299 pages, illustrated. New York, Oxford University Press, 1931. Cloth, \$3.50.

This book is a splendid attempt of presenting a brief résumé of the important periods in Dr. Osler's vivid, colorful and useful life with especial emphasis on the more intimate glimpses as revealed by personal letters and quotations from Sir William's own addresses and essays.

Edith Gittings Reid quotes freely from Dr. Cushing's Life of Dr. Osler and acknowledges that her aim is simply to present Dr. Osler as the humane and beautiful character, that he was, so that from her book the reader will turn to Dr. Cushing's Life and "live from day to day with this master and lover of men," and thanks to her beautiful style of writing and her masterly presentation, she has undoubtedly accomplished her purpose.

WILLIAM RACHLIN.

GUIDE TO RADIOLOGIC DIAGNOSIS IN HEART DISEASE. Prepared with the aid of the Committee on Research of the Heart Committee by GLEA NEMET, M.D. 12mo of 25 pages, illustrated. New York, New York Tuberculosis and Health Association, Inc., 1931. Paper, 35c.

This book is a masterpiece and should prove helpful in the study of cardiac X rays. Special attention is paid to the shadows cast by the right ventricle. Rotation and displacement of the heart, enlargement of the individual chambers, changes in the aorta and the results of hypertension are clearly defined. This booklet should be in the hands of every roentgenologist and in the library of every cardiologist. The medical profession should be very grateful to Dr. Nemet for his guide to the radiologic diagnosis in heart disease. SIMON FRUCHT

A THOUSAND MARRIAGES. A Medical Study of Sex Adjustment. By ROBERT LATOU DICKINSON and LURA BEAM. Octavo of 482 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1931. Cloth, \$5.00 (Medical Aspects of Human Fertility Series issued by the National Committee on Maternal Health, Inc.)

The problems of marriage are indeed many and complicated when viewed singly and when these dissimilar complexities are multiplied by a minute consideration of hundreds of cases we have a truly overwhelming presentation of marital unhappiness.

Doctor Dickinson has shown in this work what a vast and painstaking field the specialty of gynecology could offer. He has sought and found evidences of emotional experiences, such as frigidity, passion, dyspareunia, also, fertility, and separation and divorce in diseases of pelvic organs. Pelvic disease meant more to him than strict gynecological study. It also included a thorough study in relation to sexual aberrations and psychic disturbances.

One thing the reviewer failed to find, namely, whether such emotional disturbances as frigidity or passion or maladjustment could be corrected or prevented by proper attention to pelvic organs, then again the vast problem of marital incompatibility in relation to social, economic, religious, and age differences was dealt with but sparingly.

Nevertheless, Dr. Dickinson has offered a comparatively new angle to the complicated marriage problem. Whether such further consideration will help to simplify this vast problem or not remains to be seen. At any rate he has struck bottom in his zeal to find some of the sources of marital unhappiness, and future investigators will no doubt depend on his work before making further contributions to that subject. EMANUEL KRIMSKY

INTRODUCTION TO THE HISTORY OF SCIENCE. By GEORGE SARTON. Two volumes in two parts from Rabbi Ben Ezra to Roger Bacon. Quarto of 1251 pages. Baltimore, The Williams & Wilkins Company, 1931. Cloth \$12.00 (Carnegie Institution of Washington Publication No. 376).

The second volume of this valuable reference work on THE HISTORY OF SCIENCE is warmly welcome. It is a marvellous undertaking and fortunately has not fallen into the errors common to this type of writing. Needless to say every library of any pretensions will have to possess it the scholar and historian who can own his volumes are to be envied.

Volume two is divided into two parts. On the jacket we read it covers the Twelfth and Thirteenth Centuries. The pagination is continuous. One index serves both parts. The publishers are wise in that the parts are not sold separately.

This volume covers the period from Rabbi Ben Ezra to Roger Bacon. There is an Introductory Chapter. Part One treats of the time of William of Conches.

Abraham Ibn Ezra, and Ibn Zuhr (the First Half of the Twelfth Century). We read of the Survey of Science and Intellectual Progress in the First Half of the Twelfth Century, the Religious Background the Translators the Philosophic Background Mathematics and Astronomy, Physics, Technology and Music Chemistry, Geography Natural History Medicine, Historiography, Law and Sociology, and Philology and Education. In Book Two—the time of Crmona, Ibn Rushd and Maimonides (Second Half of the Twelfth Century) the subjects covered are Survey of Science and Intellectual Progress in the Second Half of the Twelfth Century, and the Chapters treated are the same as in Book One.

Part Two (Book Three) covers the Thirteenth Century—the time of Robert Grosseteste, Ibn al Baitar and Jacob Anatoli (the First Half of the Thirteenth Century) while Book Four deals with the time of Roger Bacon, Jacob ben Mahir ibn Tibbon and Quth al din al Shirazi (the Second Half of the Thirteenth Century). The chapter headings follow a general outline and are divided as in Book One.

George Sarton Associate in the History of Science Carnegie Institution of Washington has done an epoch making work. We have no criticisms. It is an outstanding and valuable landmark in the literature of THE HISTORY OF SCIENCE. T S W

SURGICAL CLINICS OF NORTH AMERICA. Published every other month by the W. B. Saunders Company, Philadelphia and London. Per Clinic Year (6 issues) Cloth \$16.00 net paper \$12.00 net.

Vol. 11 No. 1 February 1931 (Chicago Number). This issue represents a crosscut of Chicago's best surgery. Most of the articles are of great practical value. The editors have fortunately avoided the bizarre in surgery and have thus made the material of more absorbing interest to the general surgeon.

Vol. 11 No. 2 April, 1931 (Lahey Clinic Number). The Lahey Clinic issue. The name is a recommendation itself. The individual articles need not be itemized. Each one is timely, intensely practical and reflects the best in surgery that America has to offer.

Vol. 11, No. 3 June 1931 (New York Number). This issue is particularly important because of the symposium on fractures by members of the New York and Brooklyn Committee of the American College of Surgeons. The rest of the issue which emanates from the various New York clinics is most instructive and gives the reader an excellent picture of the outstanding surgical work being done in these hospitals.

Vol. 11, No. 4 August 1931 (Mayo Clinic Number). The Mayo Clinic issue of the Surgical Clinics never needs a detailed review. Each and every article has the backing of thorough and vast experience behind it. The names of the authors are familiar and authoritative to every American surgeon.

Vol. 11 No. 5 October 1931 (Pacific Coast Surgical Association Number). This issue of the Surgical Clinics has between its covers contributions from 30 Pacific Coast Clinics many of which are of national renown. A total of 49 different topics are discussed among them such popular ones as head injuries spinal anesthesia Carcinoma of the breast, lip and prostate cholecystitis and many rarer ones. The high standard of scientific presentation is maintained throughout the volume.

Vol. 11 No. 6 December 1931 (Philadelphia Number). The Philadelphia number of the Clinics has among its contributors the names of Deaver Jackson Babcock and many other noted surgeons. Several of the articles are resumes and statistical critiques of follow up clinics. These are valuable because of the deductions that can be drawn from them. The case reports are all well selected and presented. The illustrations are as usual excellent. GEO. WEISS

OUR NEIGHBORS

STATE DEPARTMENT OF HEALTH OF ALABAMA

The State Department of Health is headed with the Board of Censors of the Medical Association of the State of Alabama acting as Board of Health, or "Committee on Public Health." These censors are elected by the State Medical Association; and they appoint the State Health Officer, and conduct the administration work of the Department.

The Journal of the Medical Association of the State of Alabama for March contains two articles outlining the origin of the dominance of the State Medical Association in public health. The first article is by Dr. Toulmin Gaines of Mobile, describing Dr. Jerome Cochran who was the outstanding leader of the State Medical Association from the time of the Civil War until his death in 1896.

"Our organization leaped full-fledged from the Jovian brow of Jerome Cochran, short of stature and not bulky of frame as some have described him, but slight and slender with a large head, rather sunken between the broad and stooped shoulders of the student; a voice light, high, and rather effeminate in social conversation, which, however, could become rasping and incisive in debate. His general appearance belied his power, but the steely glint of his gray eyes and the firmness of his thin-lipped mouth soon demonstrated that he was 'the little corporal'; he was a veritable Napoleon. Coming to my home town immediately after the Civil War he mingled with a group of physicians who have been characterized as men who, cultured and prominent, enjoyed the love and confidence of the people of Mobile and of the entire State. Devoting their entire time to the cure of the sick, the exigencies of their enormous practices had resulted in the neglect of the county Society activities. Dr. Cochran, a born organizer, with his heart ever set on the prevention of disease rather than on the practice of medicine, infused new life into an almost moribund association. Though a comparative stranger he made bold to criticize these grave and reverend seigniors and to reprove the prominent, influential, and to the manor born physicians for their laxity as an organized scientific body, and in so doing, as Dr. Sanders says, 'he, Martin Luther like, set in motion a reformation destined not only to bear fruits for the Mobile Medical Society, but to extend itself to every county in the State and to result in a harmony and completeness of organization among medical men, such as does not exist anywhere else on the face of the earth.'

"Since it is universally conceded that the most satisfactory government is that of a benevolent despot and since his wisdom and efficiency as a sanitarian were beyond criticism, Dr. Jerome Cochran, as State Health Officer, remained as virtual and actual head of the organization from 1873 until his death in 1896, his reputation as a beneficent leader untarnished, as a sanitarian the ideal of his profession, as a man the idol of many. To paraphrase an expression of the late Dr. Mack Rogers: 'To all he was an inspiration, to many he was inspired.'"

The second article in the Alabama Journal is by Dr. J. N. Baker, State Health Officer:

"It so happened that, in the realm of public health, the medical profession in Alabama, at the very dawn of public health activities, produced a man—Jerome Cochran—who had not only foresight and vision but courage and executive ability as well. He envisioned then what today is an axiomatic and conceded fact, viz., that the field of public health is a specialized field, requiring for its successful prosecution, skillful and trained leadership and control. After much persuasion he was able to convince his profession of the soundness of such views. Once this was accomplished, he had little or no difficulty in showing the people of his State the wisdom of such a plan. The General Assembly of Alabama in 1875 took over bodily the medical machinery set up by Cochran in each county of the State and for the State at large, as its legal and duly constituted health agency and made it one of the important arms of the State government. In a word, this constitutes the uniqueness of Alabama's plan, viz., the definite placement of a highly technical field of governmental activity upon the shoulders of a specialized group within the State. Such a scheme has not its counterpart in any other State in the Union nor, to the writer's knowledge, anywhere else in the civilized world. The continued success of such a plan—for its success up to now stands unchallenged—will unquestionably hinge upon the vision and perspicacity of the leaders within this group to which so important a trust has been committed. At present, Alabama's public health system enjoys not only the full confidence and support of its own people, but the admiration of its sister States. Its machinery is smooth, flexible and democratic, with a minimum of extraneous political influence, which so often may prove baneful to sustained and carefully planned health programs.

ARTHRITIS

In Acute Gonorrheal Arthritis A Valuable Adjuvant

In the issue of the Illinois Medical Journal for June, 1931, Drs. D. F. Rudnick and H. J. Burstein of Cook County Hospital, Chicago, report the results obtained by the use of different therapeutic measures in 31 cases of acute gonorrheal arthritis

In their summary of results they refer to Mono-Iodo-Cinchophen Compound as a valuable adjunct in these cases. "In some instances its

usage alone afforded good relief"

They also state that "brilliant results have been noted from Mono-Iodo-Cinchophen in cases of epididymitis. Prompt relief of pain and an early resolution were outstanding factors."

Mono - Iodo - Cinchophen Compound is available under the name FARASTAN

(Continued from page 562)

"The most important single responsibility now confronting the doctors of this State—i.e., the organized medical profession—is to see that no corroding forces spring up from within this group to eat away and destroy the usefulness of this rare type of health machine to which they have fallen heir. Its capacity for ready adjustment to modern ways of prosecuting health work has been amply proven by test and is conceded by the leading national health agencies.

"The rank and file of the profession throughout the State must display sufficient interest to insure that suitable and proper representation is given them in the House of Delegates and in the College of Counsellors—the voting strength of the Association. This voting body, upon which rests the responsibility of selecting all Association officers—including the ratification of the election by the Board of Censors of the State Health Officer—should be dominated solely by a spirit of the fitness of the individual for the office sought, in so far as the good of the organization is concerned. The personally ambitious or politically minded member should quickly be made to realize that the high aims and purposes of this organization are not to be relegated to the background for the sake of personal preferment. Disharmony and factional discord, whenever they rear their ugly heads, must be promptly and

definitely dealt with by showing that the basic principles upon which the success of this organization rests can never be submerged in the sea of personalities and petty prejudices."

LEGAL STATUS OF CHIROPRACTORS IN WISCONSIN

The March issue of the *Wisconsin Medical Journal* contains the following record of the decision that chiropractors are not physicians:

"Declaring that a chiropractor is not a physician even though he treats the sick and that the services of a chiropractor are not the services of a physician under any conditions, the Wisconsin Supreme Court in February rendered a sweeping decision against chiropractors in a case that arose under the workmen's compensation act. The decision reverses the Circuit Court which had held against the Industrial Commission.

"The case arose in Green Bay when a city fireman obtained treatments of a chiropractor for an injury received in his line of duty. The Commission refused to allow the claim of the chiropractor and the Circuit Court upheld the chiropractor. This decision was reversed by the Supreme Court, Justice Fowler writing the Court's opinion."

An abstract of the decision is as follows:

"The only point involved is whether the charge

COMMITTEE ON PUBLICATION.

(Continued from page 564—adv. xvi)

of a registered chiropractor for treatment of an employee entitled to compensation under the workmen's compensation act is allowable as an item of his compensation. The Commission held that it is not and disallowed the item. The circuit court reversed the Commission's order and directed its allowance.

"Under the governing statute, Sec. 102.09, Stats. 1927, the expense of treatment recoverable is limited to 'medical, surgical and hospital treatment . . . or at the option of the employee . . . (under certain circumstances) Christian Science treatment in lieu of medical treatment.'

"The learned circuit judge based his reversal upon the idea that chiropractors giving medical treatment as that term is defined in ch. 147 of the statutes which is headed 'Treatment of the Sick' and governs the practice of medicine and surgery. While it is true that according to that chapter chiropractors do treat the sick and that their treatment is 'medical treatment,' it does not necessarily follow from this that it is such medical treatment as the workmen's compensation act contemplates. The legislature might give such meaning under the act to the term 'medical treatment' as it saw fit, whether it corresponded with the definition of ch. 147 or not. Doubtless we should hold that under the act the term has the same meaning as in ch. 147 unless the act indicates clearly that it uses the term with a different meaning. But we are of opinion that under the act the only medical treatment contemplated is medical treatment administered by a physician; and we are also of opinion that a chiropractor is not a physician as that term is used in the act and in ch. 147.

"Manifestly the statute does not consider Christian Science treatment as medical treatment although it constitutes treatment of the sick and treatment of disease. Such treatment is 'in lieu of medical treatment'; therefore it is not medical treatment. The same is true, under the act, of chiropractic treatment. From the act it appears very clearly that the act contemplates that only physicians may give the medical or surgical treatment for which compensation is allowable.

"Under ch. 147 a chiropractor is not a physician, even though he does treat the sick and treat diseases and diagnose. Under that chapter, physicians are licensed to practice medicine; Sec. 147.17; while chiropractors receive a 'certificate of registration in the basic sciences and a license to practice chiropractic.' Sec. 147.23. But 'no certificate of registration shall be considered as the equivalent of a license (to practice medicine). Sec. 147.17. And 'no person not possessing a license to practice medicine and surgery, or osteopathy, or osteopathy and surgery under Sec. 147.17 shall use or assume the title 'doctor' or

(Continued on page 567—adv. xix)

(Continued from page 566—adv. vixii)

pend to his name the words or letters 'doctor,' Dr., 'specialist,' 'M.D.,' or 'D.O.' Sec. 147.14 3). Thus these names and letters may be applied only to those who are licensed as physicians to practice medicine and surgery, and conversely those to whom the names and letters may not be applied are not physicians."

PUBLIC HEALTH CONFERENCE IN WASHINGTON

The March issue of *Northwest Medicine* has the following editorial comment on a national public health conference:

"A meeting of federal, state, county and city health officers was held at Seattle, February 20, for the purpose of discussing medical economics and public health matters, under the direction of Dr. H. J. Whitacre, president of Washington State Medical Association. While it was well attended by public health officers, there was a disappointing absence of representatives from the medical profession who it was hoped might attend in considerable numbers. Papers were presented dealing with many aspects of public health matters and problems of health officials, the discussion of which further developed questions of interest to all physicians and affecting the welfare of the general public.

"Both among physicians and laity there is a confusion regarding the duties of the health officer and county physician. The health officer is appointed to supervise the health of his district, such as control of communicable diseases, regulation of sanitation and allied interests, while the county physician is expected to care for the indigent of his county, having nothing to do with public health matters. When a full-time health officer is employed, there is no misunderstanding, since his duties are clearly defined. The part time health officer, however, who is engaged in private practice as well as looking after health affairs and treating the indigent, is subject to much criticism. Often he receives no compensation as health officer and treats the indigent on a fee schedule which may be subject to much abuse. The counties in which this prevails are the ones most criticized for failure to report communicable diseases, often due to hesitation on the part of some physicians to report cases to a public official who is their competitor in practice. The solution of these problems, as well as the establishment of a more complete system of health supervision, can be obtained by the appointment of district health officers. Thus, several counties, unable individually to maintain full time health officers, can do so by combining into one district.

"In all medical gatherings where medical economics is the subject of discussion, it is inevitable that interest shall center about the question of the

(Continued on page 568—adv. vix)

When we say S.M.A. is "Like Breast Milk" We mean similar in ALL these ways:

1. **Fat** - the same, both in amount and in kind
2. **Protein** - the same, both in amount and in characteristic low curd tension
3. **Carbohydrate** - the same, both in amount and in kind, namely lactose.
4. **Minerals** - adjusted to the standards set by human milk.
5. **Correlation** - the relationship of food constituents to one another is the same as in breast milk
6. **Other Physical Characteristics** - Caloric value, pH, depression of freezing point, electrical conductivity, are the same as breast milk.
7. **Buffer Curve** - varies within the same limits as breast milk
8. **Digestibility** - gastric emptying time is the same as breast milk.
9. **Stools** - similar in color, odor, and consistency to breast milk, and the bacterial flora is predominantly acidophile.
10. **Vitamin A** - regarded by many as the anti infective vitamin, is present in S.M.A. in adequate amounts
11. **Uniformity** - Composition of S.M.A. is always the same wherever fed
12. **Keeping Quality** - S.M.A. keeps and is safe to feed in any climate
13. **Simplicity** - no complicated formula to harass the busy physician and confuse the mother
14. **No Modification** - for more than 90% of well infants, S.M.A. requires no modification, although S.M.A. is very flexible

PLUS:

The Antirachitic Factor - Breast fed infants are customarily given cod liver oil to prevent rickets and spasmophilia. S.M.A. incorporates enough cod liver oil to prevent rickets and spasmophilia.

For Further Details and Trial Packages Send Coupon Below.

What is S.M.A.?

S.M.A. is a food for infants—derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil, with the addition of milk sugar, potassium chloride and salts, altogether forming an antirachitic food. When diluted according to directions, it is essentially similar to human milk in percentages of protein, fat, carbohydrates and ash, in chemical constants of the fat and in physical properties

S.M.A. was developed at the Babies and Childrens Hospital of Cleveland and is produced by its permission exclusively by

(Continued from page 567—adv. xix)

physician devoting a good share of his services without compensation. The unavoidable comparison is made between the free services expected from the physician and the compensated labor which are expended by all other professions and groups of citizens. This imposition upon the medical profession is constantly increasing in proportion of the multiplication of public hospitals and free clinics. Much attention was paid to this form of abuse. No adequate solution was proposed by which members of the medical profession might receive a square deal, but the general sentiment seemed to indicate that no relief may be anticipated until physicians shall unite in co operative effort which may bring relief."

GRADUATE EDUCATION IN VIRGINIA

The February issue of the *Virginia Medical Monthly* has a report of the Committee of Clinical Education, showing the courses in graduate education had been conducted by four-fifths of the City Medical Societies, two-thirds of the District Societies, and one-fourth of the County Societies. The report concludes as follows:

"One of the most interesting suggestions submitted referred to the educational importance of full reports to the family physicians in regard to patients admitted to the college hospitals, a suggestion endorsed by the Chairman of this Department as one that 'is perfectly reasonable and should unquestionably be done.' The problem of stimulating interest in society meetings was brought up in several reports—a problem which will most likely tax the zeal of interested officers for some time to come. Gratifying willingness to cooperate in educational programs was expressed or implied. In only two answers was the purpose of the Department of Clinical Education patently misunderstood: 'Our members do not want an instructor to come into this territory to tell them on home ground how to do their work,' and 'Our Medical Society will not consider any educational program put on by the Medical Society of Virginia in their home towns as they believe that it lowers their standing in the district in which they work.'

"It cannot be too often emphasized that the Department of Clinical Education has no intention of trying to 'put over' any program not desired by the members of a group. It exists only to further the educational activities of societies which need and request its assistance. It is not an outside body attempting to interfere in professional matters, but the arm of the Medical Society of Virginia created by it to reach out with definite encouragement to those of its members who are big enough in mind and heart to admit that they do not know it all and that they want to keep on learning. Fortunately for medical progress, they are the vast majority!"

DETOXIFICATION OF THE ENTERIC TRACT

● When such conditions as headaches, vertigo, chronic constipation, so-called chronic appendicitis, and gall bladder infections, urticarias, eczemas and arthritis are directly or indirectly

due to an absorption of toxin from the intestinal tract, the logical treatment is detoxification with Soricin.

Recent clinical research has demonstrated the feasibility of overcoming toxic absorption from the bowel by the use of the detoxifying agent Soricin—a physiologically standardized preparation of purified sodium ricinoleate.

Morris and Dorst have shown that "sodium ricinoleate detoxifies many organisms in the enteric flora in vitro" and there is worthy evidence to suggest that "sodium ricinoleate administered by mouth exerts a detoxifying action on the enteric flora in vivo."

Detoxification of the intestinal tract has been made available to the medical profession by the introduction of

CANCER CONTROL IN PENNSYLVANIA

The Commission on Cancer of the Medical Society of the State of Pennsylvania, of which Dr. J. M. Wainwright, of Scranton, is Chairman, offered a prize of one hundred dollars to the interne in a Pennsylvania hospital offering the best thesis on the subject "How to diminish deaths from cancer in Pennsylvania." The prize was awarded to Dr. W. A. Lell, of the Graduate Hospital, Philadelphia, whose plan is printed in the scientific department of the Journal. Dr. Lell would have the State establish and maintain six diagnostic cancer centers distributed throughout the State and outlines their plan as follows:

"These clinics should be conducted in an approved hospital by a full-time staff consisting of a capable surgeon, radiologist, internist, and well-trained assistants who shall carefully study the patient and obtain accurate records. This having been completed, the best plan of treatment is determined and carried out in an approved hospital of the district under combined supervision and cooperation of the tumor clinic and hospital staff. In addition to these diagnostic centers, a central bureau should be established whose function would be to supervise the activities of these clinics and of the approved hospitals in which patients are being treated. This bureau should serve as a central station for filing of records, data of tissue examinations, course of treatment, and ultimate fate of all the cancer patients being treated throughout the State."

Dr. Lell would have a commission appointed to establish and supervise the centers and set up the machinery for their administration. The Journal comments editorially on the plan as follows:

"The plan suggested by Dr. Lell for diminishing the death rate from cancer proposes no sensational method. He suggests a system of State diagnostic clinics, with a central bureau to keep records of cases, treatment, and cure, to suggest some conclusions in regard to causes and cures which might be obtained by the concentration of all the cancer records in the State as they are made, and a full study over a period of years. The dis-

"State clinics might be able to diminish the operations of quacks, and charge the public heavily for their unscientific and faked methods and methods of treatment. Very few of them have the approval of medical science. The proposed plan, indeed, is simple of social science because it sends the few scientific certainties. It is in the present on the of cancer.

"It is intended to give opportunity and impartial diagnosis and a chance with the help of such methods of treatment who have had some success. It admits that much rest they unknown and that medical science must have access to all available evidence if the cause and cure for cancer are to be determined."

*Fills the need for a dependable
antacid mineral water*

VICHY CÉLESTINS

This long renowned naturally alkaline mineral water assists in neutralizing excess acid and in regularizing functions of the digestive tract.

Bottled at the Spring in Vichy, France, under Government supervision, it meets the great need of the physician for constancy of composition.

PUBLIC HEALTH PRACTICE IN ARKANSAS, No. 2

An abstract of a report of the Council of the Arkansas Medical Society on the activities of the State Board of Health was printed on page 161 of this Journal of January 15. The report contained our suggestions regarding cooperation between the State Board of Health and the State Medical Society. The January number of the Journal of the Arkansas Medical Society contains the following reply of C. W. Garrison, Secretary of the Arkansas State Board of Health.

"We have just read and discussed the recommendations of your committee regarding the cooperative program with the State Board of Health and desire to inform you and through you the members of the medical profession of the State that we heartily agree that in order for this Board to project its program most effectively that it must be based on sound principles and in turn must receive the support of the Arkansas Medical Society and the medical profession in general. We have fully considered your recommendations and find that there is nothing in your recommendations which cannot be reasonably well harmonized with opinion and policies of this Board.

We are pleased to note that there is complete agreement on many of the points under discussion, and we assure the Council and the Arkansas

Medical Society that it is the policy of this Board to avoid encroachment upon curative medicine and so called state medicine, and every effort will be made to confine its activities to purely preventive measures.

"The Board also desires to advise the Arkansas Medical Society through its Council of its eagerness to cooperate with the Council in all matters pertaining to its practices in relationship to organized medicine and public health, and to work with the county societies for the betterment of public health.

"The Board deeply appreciated the careful consideration your committee has given to this matter and feels that it will only be a matter of a short time until a complete understanding will obtain and all differences composed. The Board further wishes to express its deep appreciation for the fine support of the Arkansas Medical Society in the years past and expresses the hope that full confidence and cooperation will be re-established at a very early date.

"May we respectfully urge in this connection indulgence and tolerance on the part of the medical profession as we attempt to adjust all differences to the end that we may reach a feeling of goodwill and complete understanding."

Mercurochrome-220 Soluble

in

OBSTETRICS

A statistical study of a series of over 9000 cases showed a morbidity reduction of over 50% when Mercurochrome was used for routine preparation.

AN OLD MEDICAL BILL IN SOUTH CAROLINA

The February number of the Journal of the South Carolina Medical Association has a full-page reproduction of a medical bill of a Doctor Hill to John Martini for services rendered from September 28, 1736, to January 2, 1738, amounting to 55 pounds and 10 shillings. A number of the items were for attendance on a Mrs. Hatty, the cook, and other members of the household, the items for services to her being as follows:

L. S. D.

"May 16, A bleeding to Mrs. Hatty's foot	0	15	0
Six hysterige bolus for ditto....	2	5	0
A cordial and hysterig julyp four once to ditto	1	0	0
June 7, A vomit for ditto	0	10	0
7, A pint of coroboratif fomentation for ditto	1	0	0
8, The fomentation repetet to	1	0	0
9, A purg for ditto.....	0	10	0
11, Some cardus and camomill-flower to ditto.....	0	5	0
25, A febrifug draught to ditto.	0	10	0
26, The draught repetet to ditto	0	10	0
Aug. 4, A bottel of stomach drops to ditto	0	15	0
Sept. 6, A pectoral linctus for the cook	0	15	0
9, A box of absorbens powder for Mrs. Hatty.....	0	15	0
12, A bleeding to the cook...	0	10	0
13, The pectoral linctus repetet to ditto	0	15	0
18, A vomit for Mrs. Hatty....	0	10	0
25, A purg for a neigroe gurle.	0	10	0
26, A bottle of stomach drops for Mrs. Hatty.....	0	15	0
Oct. 21, A vomit for fiba.....	0	10	0
Nov. 3, Some oyntment for ditto..	0	5	0
29, A purg for a neigroe child..	0	10	0
Dec. 17, A bleeding to Mrs. Hatty foot	0	5	0
1, A bottel of cordial and hysterig bottel to ditto....	1	0	0
19, A pectoral linctus for the cook	0	15	0
21, The linctus repetet for ditto	0	15	0
25, Ditto Linctus repete.....	0	15	0
1737/8 January 2, A pot six ounces of pectoral electuary for ditto cook	1	0	0
Six pectoral tablets to ditto....	0	7	0"
The last item was as follows:			
"Attendance on Hester Fleming in the Small Pox	10	0	0"

A TALE OF DOMESTIC HAPPINESS

She was a nagging nervous wife, he a raging irritable husband. They were told it was "all a question of diet." If the human animal is properly fed, he—or she—is likely to be amiable and easy going.

So he went on a three months' cure where fasting "alternated with carrots, salads, golden maize meal, porridge and plenty of milk." She too undertook a three months' rest and "a diet of cream, honey and raisins."

After three months they reunited; he more generous and less ferocious, she more docile and angelic. When regular food again threatened to disturb their domestic happiness, their physician recommended less drastic measures and prescribed CAL-BIS-MA.

A wise physician, he knew that the suffering from gastric hyperacidity is likely to disturb the most amiable disposition. Instead of a freak diet, regulation of the stomach function is the rational remedy.

Cal-Bis-Ma is a combination of calcium and magnesium carbonates, sodium bicarbonate, bismuth and colloidal kaolin, blended into a palatable powder. It neutralizes excess gastric

acidity quickly, efficiently and with lasting effect. . . We will gladly explain the therapeutic merits of Cal-Bis-Ma and send a professional trial package for the asking. . . . Send for it.

THE 126TH
ANNUAL MEETING
OF THE
MEDICAL SOCIETY
OF THE
STATE OF NEW YORK
BUFFALO, N. Y.

MAY 23, 24 AND 25
1932

(Continued from page 572—adv. xxiv)

The bill was paid and receipted by "John Martini."

A linctus is defined by the Standard dictionary as "a syrup-like medicine to be taken by licking or sucking," and is derived from the Latin *lingo*, to lick.

A bolus is defined as a large soft pill, made extemporaneously, to be taken at once. The doctor seems to have made six to cure Mrs Hatty of hysteria.

EXECUTIVE SECRETARY FOR LOUISIANA

The April number of the *New Orleans Medical and Surgical Journal* has a President's page in which Dr. S. C. Barrow gives the following arguments for the employment of an executive secretary by the Louisiana State Medical Society:

"The time is fast approaching, if not already here, when the State Society must have a full time trained Executive Secretary; a man scientifically trained and versed in the problems of organization; one familiar with the basic evils besetting the medical profession; one who can teach the rank and file, methods of procedure, and formulate uniform programs of action by the various Parish Societies, which will tend to the enlightenment of the public, hasten the relief from many present ills and defeat the many evil tendencies.

"The State Association, sooner or later, must put in the field, a man with such qualifications, one whose program will be to travel from one end of the State to the other, meeting regularly the Parish Associations, working out their individual problems and collectively, those of the State Association.

"With only half, or less, of the qualified physicians of the State, members of the State Society, there can be but one conclusion reached; that conclusion is, 'There is something wrong with the State Association.'

"A little self analysis will do us good. Louisiana needs a medical association which will function three hundred and sixty-five days out of the year, rather than four or five; she needs an association with live departments looking to the solution of all problems which concern the doctor. Under our present plan, this is impossible. Money must be spent and for such a purpose it will prove a most wise and profitable investment.

"It is our intention to suggest to the House of Delegates on May 9, that a carefully selected committee be appointed to look into the feasibility of such a plan and to make suggestion after careful study and investigations."

CANCER CONTROL IN MASSACHUSETTS

The March eighth issue of the *New England Journal of Medicine* contains the following description of a new form of cancer clinic that is being conducted in several cities in Massachusetts

"Clinics devoted primarily to the showing of 'cured' cases of cancer would be of great value to the profession as a whole or this reason the Cancer Committee of the Massachusetts Medical Society in cooperation with the Massachusetts Branch of the American Society for the Control of Cancer and the State Department of Public Health as sponsored such clinics

"These 'cured' Cancer Clinics are to constitute an important part of the State-wide Cancer Achievement Week Program April 4-10. These clinics will be held April 5 and 6

"A booklet is being prepared which contains the history of the 'cured' cases to be presented at the clinics. In order to be assured of the initial existence of cancer, sections on all these cases have been reviewed by a committee of pathologists consisting of Dr. S. Burt Wolbach, Dr. Tracy Mallory and Dr. Shields Warren. There will be a dinner for the medical and dental groups at the Boston City Club, Tuesday April 5

"A luncheon for the medical and dental groups will be held Wednesday, April 6, at the Boston City Club

"All the dentists in the State will be invited to attend the course. Special clinics have been arranged for them at the Harvard and Tufts Dental Schools and they will join the physicians at the Boston Dispensary clinic, the dinner, and luncheon sessions

"In addition to these activities for the medical and dental groups meetings for the cancer education of the lay public are to be held in Boston and other clinic cities"

PACKAGE LIBRARY SERVICE IN TEXAS

The service of the State Medical Association of Texas in supplying packages of printed material to the members is described in the March issue of the *Texas State Journal of Medicine* as follows

"Our Package Library Service may prove particularly useful just at this time, when our readers are preparing papers for the annual session, preparing to discuss papers at the annual session, or reading up on the subjects to be discussed there. We appreciate that quite probably most of the papers on the program have already been written and, as for that, read before county societies, as required by the State Association by laws, but even so, a check-up may be in order

"It may not be generally known, but the library of the State Medical Association has accumulated 23,401 reprints of articles published in the leading medical journals of the world. A large range of subjects is covered. They are filed in accordance with the classification of the Quarterly Cumulative Index Medicus. A whole-time, trained librarian, is in charge. Packages may be had, upon request, by any member of the State Medical Association. The cost of this service is nominal and intended merely to cover postage, which as a matter of fact it barely does. The charge is 25 cents per package, regardless of size or number of reprints included. Stamps will do. Packages may be held for two weeks or longer upon special request if the reprints included have not in the meantime been requested by others

"This service has received the enthusiastic and appreciative approval of quite a few of our members"

A packet Library service in California is described in the *New York State Journal of Medicine* of January 1, 1931, page 736, and a similar one in Wisconsin in the *JOURNAL of Medicine* 15, 1930, page 116

CLASSIFIED ADVERTISEMENTS

Classified ads are payable in advance. To avoid delay in publishing, remit with order. Price for 40 words or less, 1 insertion, \$1.50; three cents each for additional words.

WANTED: Salaried Appointments everywhere for Class A physicians. Let us put you in touch with investigated candidates for your opening. No charge to employers. Established 1896. Aznoe Service is National, Superior. Aznoe's National Physicians' Exchange, 30 North Michigan, Chicago.

ARLINGTON, New Jersey, 211 Stewart Av. —Attractive 7-room house; plot 120x103; oil burner; 2-car garage; 8 miles from New York City; 5 minutes' walk from station and bus lines; rent \$100 month or sell, easy terms, or exchange for reliable stock or bonds at par. Owner, Box 5, Care N. Y. State Journal of Medicine.

482 Linden Blvd., Brooklyn. Corner house for sale or rent. Ideal location for doctor. Phone Hegeman 3-7661.

FOR RENT: Physician's office, fully equipped, ground floor of private house. Good location, near subway, bus and trolley. Rent reasonable. 25-16 Newtown Avenue, Long Island City, New York. Telephone Astoria 8-4545.

Refined young Christian woman of thirty would look after doctor's office and assist with patients in return for room and board with small allowance. Typewriting and general office experience. Pleasing personality. Excellent references. Will go anywhere. Remuneration secondary to useful light occupation. J. H. M., Box 16, care N. Y. State Medical Journal.

POSITION WANTED: Physician experienced in mental disease, desires a responsible position in sanitarium specializing in these cases. Best of references as to professional ability, character, etc. Address Competent. Box 17, Care N. Y. State Journal of Med.

WARNING ON BICHLORIDE TABLETS

The drug trade press recently contained a warning from Dr. E. Fullerton Cook, Chairman of the Committee of Revision of the United States Pharmacopœia, concerning the danger to the public of bichloride of mercury tablets that, because of their shape or color, may be confused with tablets intended for internal use. His warning follows the tragic death of a friend who took bichloride tablets by mistake. A physician had recommended these tablets; a pharmacist had dispensed them. They were white in color, discoid in shape. The word "POISON" appeared on each tablet in raised letters, yet the accident occurred.

Eli Lilly and Company are said to have been the first manufacturers to recognize the need for ample precautions surrounding the sale and use of tablets of bichloride of mercury. The outgrowth of their studies was a bottle of distinctive design, diamond shaped, with serrated edges and the word "POISON" in raised letters blown in the glass. Even in the dark, Diamond Antiseptics, Lilly, are recognizable by touching the container. Diamond Antiseptic Tablets are diamond shaped; therefore, it is claimed that they cannot easily be confused with headache or other tablets. The word "POISON" appears on one side of the large tablet, which contains 7.3 grains of mercury

bichloride, and a skull and crossbones is printed on the reverse. Diamond Antiseptics, Lilly, we are informed, meet fully the requirements of both Federal and state food and drug laws. Neither physician nor pharmacist should take any chances, it would seem, when such "safety first" products as Diamond Antiseptics, Lilly, are available. See page xiv.—*Adv.*

TECHNICAL EXHIBIT OF S.M.A. CORPORATION

Specimens of human milk fat will be shown by the S.M.A. Corporation at the Annual Meeting, Medical Society, State of N. Y., May 23-25. Physicians attending the convention will have an opportunity to see the close similarity of S.M.A. fat to breast milk fat in chemical and physical properties.

An interesting motion picture will also be shown at their exhibit entitled "Infantile Spasmophilia."

S.M.A., an infant food resembling breast milk and containing cod liver oil, is claimed by its producers to be an automatic protection against rickets and spasmophilia.

A new product, known as SMACO Hypo-Allergic Milk, developed especially for infants and adults sensitive to milk protein, will also be exhibited by the S.M.A. people. Their Research Division will show a number of rare proteins and rare acids. See page xix.—*Adv.*

COLUMBIA UNIVERSITY NEW YORK POST-GRADUATE MEDICAL SCHOOL GYNECOLOGY

SEMINAR COURSES—one to three months, continuous throughout the year. Approximates 31 hours a week, including: clinical gynecology; diagnosis and office treatment; lectures in gynecology; demonstration of operative procedures; cystoscopy (6 hours weekly); endocrinology; gynecological pathology; follow-up clinics and ward rounds. Operative cadaver surgery in gynecology (12 lessons) by arrangement. Special courses in cystoscopy and endoscopy in the female, and in diagnosis and office treatment, by arrangement. Under the direction of Dr. Walter T. Dannreuther. For further information, address

THE ENEMA: ITS USE AND ABUSE*

By REUBEN FINKELSTEIN, M.D., BROOKLYN, N. Y.

THE use of the enema, as a therapeutic measure, dates back to very ancient times. An Egyptian papyrus of the fourteenth century B. C., gives directions for the preparation of enemas¹, and subsequently Herodotus noted their extensive use among the Egyptians², Hippocrates considered that enemas were preferable to purgatives and recommended the use of cylindrical suppositories of honey smeared with ox-gall as a still milder form of treatment. It is interesting to note that in the Jewish Talmud a number of centuries later, a rather similar method is mentioned. Instead of a suppository of honey, a short wooden stick was used to irritate the rectum, thereby causing a bowel movement³. In the second century B. C., Asclepiades recommended the enema for intestinal disorders, and later Celsus proposed it as a means for supplying nutrition per rectum⁴.

In the course of the following centuries, the enema was resorted to more or less regularly until the seventeenth century when it became very popular in France. During the next two hundred years, it was considered a panacea for all ills and its popularity spread to other countries of Europe. Even the medical caricatures of the period almost always represented the physician with a syringe ready to administer a clyster⁵. In early times the enema was given from a bladder or skin fixed to a metal or bone tube. The next improvement was the enema syringe invented by Avicenna in the tenth century. The present form of the enema bag with tube and nozzle dates from the middle of the nineteenth century⁶.

The enema is now chiefly administered for: The relief of constipation and intestinal distention.

2. The local application of medicaments to the rectum and colon.

3. The administration of absorbable medicaments.

4. The purpose of supplying nutrition and

fluids when mouth feeding becomes impossible or insufficient.

5. The diagnosis, with barium sulphate, of obstruction and various diseases of the colon.

6. Miscellaneous conditions.

Intestinal Relief: Constipation is the most frequent cause for the use of the enema. In this case, contrary to common belief, the solid masses are washed out only from the rectum and lower portion of the sigmoid, while the contents of the colon above the sigmoid are usually not affected. If, however, peristalsis of the colon has been stimulated, some of the contents may be forwarded into the sigmoid where they remain until a normal evacuation results or are again washed out by another enema. Much of the relief felt by the patient after an enema is due to the expulsion of the previously retained gases. However, constipation, caused by cecal retention which often follows appendectomy or chronic inflammation about the cecum, will not be benefited by the enema. Physiologically, the contents of the cecum are fluid and the addition of more fluid will not empty it, but will serve only to increase the pressure within the cecum, thus frequently causing pain because of the resulting overdistention.

The enema, nevertheless, is of undoubted value in treating spasm of the distal portion of the colon, in sigmoid retention, and rectal dyschezia. In these conditions, the enema breaks up and washes out the fecal masses. At the same time, the hot water will relieve the spasms of the bowel.

The usual case of constipation is due to the accumulation of solid material within the sigmoid and rectum, relief may therefore be obtained by an enema of normal saline or a five per cent solution of sodium bicarbonate. Such enemas do not overstimulate the bowel, and if the quantity is not excessive, they will not interfere with the normal peristalsis of the colon. In cases of severe impaction, however, more drastic measures are necessary. Four

* Read before the East New York Medical Society.

or five ounces of warm oil should be injected and retained as long as possible, even overnight. This is then washed out with a five per cent solution of bicarbonate of soda or even a solution of hydrogen peroxide, one part to three parts of water. The oil is not as irritating to the intestinal mucosa as soap suds⁷. Irritating clysters should not be administered in simple constipation and spasms of the bowel. They tend to increase the spasms and if used for any length of time will cause colitis or proctitis. Accordingly, such irritants as soap suds, ox-gall, turpentine and glycerin as a rule, should not be used in a simple enema.

The technique of administering the enema is as important as the contents. The lateral position is best; this avoids undue straining by the patient. At the same time the other organs fall away from the colon and thus lessen the pressure upon it. A short tip, or better, a catheter, should be inserted about two or three inches beyond the anus. In order to prevent undue distention of the rectal ampula and to permit the filling of the entire colon without cramps or spasms, the enema bag should be held no more than three feet above the patient.

The habit of using so-called colonic irrigations for the relief of constipation is of no more value than the usual enema, and under certain

circumstances may even be injurious to the bowel. The introduction of the rectal tube beyond the rectum is almost impossible and its improper manipulation may injure the delicate mucous membrane. The tube can be inserted beyond the recto-sigmoidal junction only when the entire colon is filled with fluid, as shown by the accompanying roentgenogram, Fig. 1. When the large rectal tube is introduced into a dry rectum it curls upon itself within the ampula and is of no more value than the ordinary rectal tip used in administering the usual low enema, Fig. 2.

FIGURE 2

Showing the rectal tube curled upon itself in an attempt to administer a high colonic irrigation.

FIGURE 1

The colon was first filled with an opaque enema. The double flow tube is pushed beyond the rectum into the sigmoid where its further progress is stopped by an angle in the colon. It also shows that only immediate part of the colon about the tip of the double flow tube is cleared of its contents by the so-called irrigation. The rectum below and the colon above the tip of the tube still retain their contents.

The return-flow tube, which is frequently employed in colonic irrigations, contains two channels, one for the introduction of the fluid and the other for its escape from the bowel. However, this method of washing out the colon presents a serious difficulty for, once the colon has been filled, further flushing takes place only around the openings of the return-flow tube. A simple demonstration of this fact can readily be obtained in the following manner. An opaque enema must be given and retained. Then a return-flow rectal tube should be introduced, under the fluoroscope, and water allowed to flow through one side and return through the other. It will be noticed that only that portion of the opaque enema will be removed which is reached by the openings in the return-flow tube. If the return-flow tube is placed six or eight inches above the anus the rectal ampula will remain filled as well as the entire colon above the point reached by the tip of the tube. This is likewise illustrated in Fig. 1.

The distention of the colon caused by the large amount of fluid injected into it when giv-

ing a high colonic irrigation, hinders its normal peristaltic action and often markedly delays it so that very little of the fluid is returned through the colon tube. Only when the colon regains its tone will the contents be discharged. The effect desired by the so called colon irrigation which is not obtained through the use of colonic tubes or return-flow tubes, can best be had by repeated enemas using the ordinary hard rubber rectal tip or catheter as previously mentioned.

Cleansing enemas continued for a long period of time are not advisable. They prevent proper peristaltic action of the bowel and gradually cause dilatation of the colon, at the same time removing the mucous so necessary as a lubricant to the mucosa. Such enemas should be used with other means to cure constipation and not as primary therapeutic measures.

Local Medication. In the treatment of diseases of the colon the medicaments should be applied in the form of a solution or powder. Powder should be applied through the proctoscope or sigmoidoscope and obviously will only reach a short distance from the tip of the inserted instrument.

Solutions of mild astringents, such as tannic acid, gallic acid, alkalies or weak solutions of silver nitrate, or massive doses of properly suspended acidophilus bacillus mixtures may be introduced by means of the enema. In cases of multiple polyposis, a six per cent solution of tannic acid will produce a tanning effect on the pedicles which will then atrophy and the polyps will be expelled.⁸ When a mild astringent is required a five per cent solution of powdered alum is often of value. All forms of colitis, dysentery, proctitis and parasitic diseases of the colon are benefited by the application of a proper enema.

Absorbable Medicaments. Such diseases as acute articular rheumatism, chorea, rheumatic cardiac diseases and sciatica are often benefited by rectal injections of solutions of sodium salicylate in large doses. On occasions, we have administered per rectum up to 250 grains of sodium salicylate in the course of twenty-four hours and have obtained remarkable results. It is well to remember that when sodium salicylate is administered per rectum and if the physiologic effects of this drug, such as head noises and ringing in the ears are not obtained within three days, either the dose given is not large enough or the absorption is poor because of some local disturbance and this form of treatment should be discontinued.

Nutrient Enemas. To supply nutrition and fluids to the patient in various diseases and after operations, is one of the most important

uses of the enema which has been developed within modern times. After operations, especially on the gastro intestinal tract, in shock in coma, in gastric or duodenal hemorrhages and in the treatment of peptic ulcers it is often necessary to supply nutrition and fluid per rectum. This may be accomplished by the Murphy drip or the continuous Harris drip, or by the so called "massive" enema in which case about ten ounces of fluid or nutrient material is injected into the sigmoid and forced to remain there until absorbed.

Until very recently, the erroneous idea was held that meat juices, eggs, salts, starch, sugar, milk and fruit juices, when administered per rectum, were all absorbed by the rectal mucous membrane. In 1901 Grutzner thought that he proved experimentally that particles introduced into the rectum ascend into the small intestine by retro peristalsis and were there digested. Riegal and Fleischer agreed with Grutzner. Hemeter, however, disagreed because he observed that after administering foodstuffs by enema they did not leave the rectum and were often evacuated by a cleansing enema the next morning. Hemeter on the other hand, believed that egg albumin, fat and milk may be absorbed from the colon as such and without previous digestion. In explanation of this phenomenon, he suggested the presence of a proteolytic ferment, working in an alkaline medium in the colon, which digests the proteins in the nutrient enema.⁹ We now know that this theory is erroneous, for no such ferment is to be found in the colon and organs of absorption for proteins, fats and carbohydrates, such as exist in the small intestines are not present in the colon and rectum. Only water, alcohol and crystalline material in solution, as dextrose, salts, sodium salicylate or sodium bicarbonate are absorbed by the rectum or colonic mucous membrane.

A five or ten per cent solution of dextrose is the ideal nutrient enema. Such an enema should be given either as a Murphy drip or continuous Harris drip. It may be combined with a physiologic solution of sodium chloride or a five per cent solution of sodium bicarbonate. Concentration of more than ten per cent is not advisable because it may irritate the mucosa with resulting proctitis. Alcohol is readily absorbed by any mucous membrane and may be given as a stimulant per rectum in dilute solutions.

Before the administration of rectal feeding in any form, the rectum should be flushed out with an enema of a physiologic solution of sodium chloride. The Murphy drip should be given slowly, not more than 30 to 40 drops per minute. The solution must be warm and the tip of the catheter should not be inserted

or five ounces of warm oil should be injected and retained as long as possible, even overnight. This is then washed out with a five per cent solution of bicarbonate of soda or even a solution of hydrogen peroxide, one part to three parts of water. The oil is not as irritating to the intestinal mucosa as soap suds⁷. Irritating clysters should not be administered in simple constipation and spasms of the bowel. They tend to increase the spasms and if used for any length of time will cause colitis or proctitis. Accordingly, such irritants as soap suds, ox-gall, turpentine and glycerine as a rule, should not be used in a simple enema.

The technique of administering the enema is as important as the contents. The lateral position is best; this avoids undue straining by the patient. At the same time the other organs fall away from the colon and thus lessen the pressure upon it. A short tip, or better, a catheter, should be inserted about two or three inches beyond the anus. In order to prevent undue distention of the rectal ampula and to permit the filling of the entire colon without cramps or spasms, the enema bag should be held no more than three feet above the patient.

The habit of using so-called colonic irrigations for the relief of constipation is of no more value than the usual enema, and under certain

circumstances may even be injurious to the bowel. The introduction of the rectal tube beyond the rectum is almost impossible and its improper manipulation may injure the delicate mucous membrane. The tube can be inserted beyond the recto-sigmoidal junction only when the entire colon is filled with fluid, as shown by the accompanying roentgenogram, Fig. 1. When the large rectal tube is introduced into a dry rectum it curls upon itself within the ampula and is of no more value than the ordinary rectal tip used in administering the usual low enema, Fig. 2.

FIGURE 1

The colon was first filled with an opaque enema. The double flow tube is pushed beyond the rectum into the sigmoid where its further progress is stopped by an angle in the colon. It also shows that only immediate part of the colon about the tip of the double flow tube is cleared of its contents by the so-called irrigation. The rectum below and the colon above the tip of the tube still retain their contents.

FIGURE 2

Showing the rectal tube curled upon itself in an attempt to administer a high colonic irrigation.

The return-flow tube, which is frequently employed in colonic irrigations, contains two channels, one for the introduction of the fluid and the other for its escape from the bowel. However, this method of washing out the colon presents a serious difficulty for, once the colon has been filled, further flushing takes place only around the openings of the return-flow tube. A simple demonstration of this fact can readily be obtained in the following manner. An opaque enema must be given and retained. Then a return-flow rectal tube should be introduced, under the fluoroscope, and water allowed to flow through one side and return through the other. It will be noticed that only that portion of the opaque enema will be removed which is reached by the openings in the return-flow tube. If the return-flow tube is placed six or eight inches above the anus the rectal ampula will remain filled as well as the entire colon above the point reached by the tip of the tube. This is likewise illustrated in Fig. 1.

The distention of the colon caused by the large amount of fluid injected into it when giv-

PSYCHOPATHOLOGY AND ORGANIC DISEASE*

By SMITH ELY JELLIFFE, M D, NEW YORK, N Y

JUST at this point in this symposium might I introduce the story of two rather well-integrated citizens who would witness a wrestling match at the Madison Square Garden in New York City. As they entered and took their seats, Londos and his opponent were in a clinch. After about 10-15 minutes one of these visitors looking up and noting Londos still in a clinch, said "Come on, Joe, let's go out, here's where we came in."

I am not certain that my tale is quite *a propos* save as to that aspect of my reappearance on the platform wherein it might seem that "here's where you came in"—and may be your state of bewilderment may more properly follow my remarks rather than have preceded them.

You have listened to two important aspects of psychopathology and psychotherapy—prophylaxis in childhood and adolescence by Dr Williams, and the Psychoneuroses and Psychoses, by Dr Brill. I would like to bring you into still deeper waters where the footing is not so secure, nor the catch so certain. I would ask your attention to the relations between Psychopathology and what is known as "Organic Disease."

In order to prepare the way, permit me to take you back to the beginning of things and by a series of lantern slides develop a concept of the human machine which will, I hope, give you something to bite on even if it threatens to dislocate any but the most solid of jaws.

I shall avoid the more heavy scholastic repetition of what should be well known ideas, how for instance, Descartes (1596-1650) and de la Mettrie developed the idea of man as a machine, nor shall I weary you with the mumbo jumbo of the philosophers and metaphysicians who have squabbled and will continue so to do over mechanistic and vitalistic antagonistic hypotheses, nor with that equally threadbare controversial topic of the relationship of body and/or mind.

Although we shall lean fairly heavily on general mechanistic conceptions I would in more simple terms emphasize the fact that Man is not a 'Jack in the Box'. Practically every activity that goes on in man is infinitely more subtle and complex than what we at the present time understand. And the reason is obvious if we only stop a moment to think about man as a time-binding animal. Although we glibly use the terms "heredity" and "constitution" it is but rarely that we realize how

long this heaping up of the past upon the past has been going on and just what has been happening in the gradual evolutionary ascent from Amoeba to Man in the billion years that it took to have this goal of Man reached.

I like to recall the term that Samuel Butler used about this process by which all experience in time became bound up in bodily structures. He called it "Organic Memory." And if you would ask for a clue as to who had worked up this set of problems most consecutively I would refer you to the works of Hering, and more particularly to those of Semon, starting with his celebrated study on the "Mneme." Should we but stop to imagine what this mnemonic inheritance really means the stoutest of us would be staggered. Should I by way of an interpolation state that at times certain individuals suffer from what I shall provisionally call "total recall" of much of these memory traces, i.e., are unable to keep them from pressing over the portals of consciousness, such patients we speak of as psychotic, as in delirium or in manic-stuporous states, for instance, and we can well understand why in times, not too long gone by, so many of them have been spoken of as "possessed."

Thus I would call your specific attention to at least two important preliminary considerations, namely, that accumulation of organic memories of billions of years in the making and which we will speak of as the "wisdom of the body," and those devices which have arisen to bind, inhibit, or repress organic processes from expressing themselves as simply as does the "Jack in the Box" with which figure I began this paragraph.

Just what these protective devices of physico-chemical binding, or physiological inhibition and of psychological repression are, will occupy us later after attention is called to a schematic representation of the energetic hypothesis—grossly mechanistic if you will—whereby the human being as well as all living organisms may be conceived of as capturing, transforming and delivering the energy of the cosmos of which they are an integral part. Man and his environment are one. He is not an independent isolated experience. He exists only by reason of and through this interchange of activities between his organic processes which his organic memory of how to handle them has, when successful, enabled him to live.

* Read at the Annual Meeting of the Medical Society of the State of New York at Syracuse N Y, June 2, 1931.

FIGURE 1

The slide before you (Figure 1) roughly indicates this situation. It is unnecessary for me to go into the details of the receptors which capture the energy any more than by saying that the kindergarten physiologies that speak of five senses must be relegated to oblivion. We have twenty and more definitely structuralized sensory receptors. Different types exist in every organ of the body and through the medium of a most highly complex switchboard series of nerve-net transformers all the literally billions of outside calls are handled by automatic processes. Here in the diagram may be seen a thumb sketch of physiology whereby and through which all the incoming experience becomes converted into processes of upkeep of the machine (anabolism and catabolism) and of the individual in society (behavior).

The moment one attempts to follow through any one of the incoming bits of cosmic reality—let us say a vestibular or an auditory stimulus we are into the thick of details of histological receptor, and physiological transmitter and connector complexities, the study of any one or the other of which some men devote an entire life to; as Helmholtz for instance did for the optical apparatus. I can refer you to no better guide of these complexities than C. Winkler's Manual of Neurology.

What does our "bodily wisdom" do with the billions of stimuli after they all stream in? Like any other billion year old factory which has been more and more successfully operated would do it has *organized* its responses, or if you will, they have organized themselves, and as in the next diagram certain patterns of performance have evolved. It is not of much particular moment what one calls these patterns; it is only desirable that in giving them a shorthand name, man should come to some sort of agreement as to what the name should stand for. Up to the present time biology has fairly well agreed, not without, of course, the usual clash of opinions about everything, to call the outstanding patterns of response

to these processes of capturing, transforming and delivering the cosmic energy—"instinct patterns."

FIGURE 2

Without going into the numerous objections we will follow this lead and for all types of living things, plant and animal, distinguish two instinct patterns which have come to be called that of Self-Preservation and that of Race Propagation. Schiller, the poet, it will be recalled termed them "Hunger and Love." While there has been and still is much dispute, filling millions of books, as to the comparative importance and significance of these two patterns I shall arbitrarily state that the creative, race-propagation pattern is the one which fundamentally must lead else there would have been no such thing as the evolution of new types of structure from Amoeba to Man. A moment's reflection will show this is obvious, although thousands of books are written about the more intimate details of the conflicting claims between the "self" and the "race." The slogan that "self preservation is the first law of nature" is one of those universally shouted slogans which like most universal slogans are always wrong. A great philosopher has been quoted for 19 centuries—"He who would save his life must lose it." Even though this quotation is rarely thought of as contributing to the significance of the conception that the race-propagation instinct pattern is the one that has the "beat" in life's flow from form to form, nevertheless this is what it signifies.

This leads to the next diagram that would dissect this internal pattern of striving or impulse, or urge, or drive, or any other synonym that one wishes, a little more in order to bring it into some objective form. All of this is still in the "wisdom of the body" although we are now coming a bit more into the open out of the tunnel of the unknown past.

In short no such thing as reproduction is going to take place, at the biological level, unless a union takes place between differentiated carriers of life's experience, termed respectively male and female. Some "ninnies," I call them, meaning no offence, set up a great to do as to the comparative values of male and female in this respect. At the biological level this is hokum. As no lock

FIGURE 3

operates (rightly) without a key, so no key is any good except for a lock and so it goes—male and female are like our previous pair, individual and environment. If the latter is out of gear—life is impossible; if the former—continuance of life in new forms is impossible. The exceptional forms of repetition through fission as in bacteria, potatoes or lily bulbs, are of no moment at this juncture.

And as our diagram further shows—that unless male spermatozoon, through penis-vagina transmission, fertilizes female ova, no new form results. This is again so obvious as to almost make one naive in saying it and yet an important principle is here involved. As all of you here know that when the urge, or drive or impulse—originally named after the God Eros—sometimes misses its object-choice (male—female) and/or its aim (penis-vagina) there results those anomalies of behavior described in the large chapter of sociological pathology of the inversions and the perversions.

This leads to the first large generalization about pattern activities which I shall emphasize as of paramount significance if we are ever going to understand the relations of psychopathology to organic disease.

This is that: *Any deviation from object or aim threatens the harmonious action patterns within the machine.*

There's a catch somewhere in this simple statement. It is literally true but needs an important emphasis to be put upon those aspects of man's impulses, drives, urges or what have you, of which man is not aware—that is within his *Unconscious*. We are not here concerned in this formulation with the individual's conscious notions concerning his object choice or his aims, although such may be in line with the vastly more important automatic unconscious processes of the wisdom of the body of which mention has been made.

An ancient prophet once wrote "All men are liars." In these matters psychoanalytic science prefers to use a more careful term. It says "all men rationalize." They have the tendency to make their belief agreeable; as out of the fulness of the heart the mouth speaketh, so most of our

explanations of our pattern motivation is autistic—i.e., wish fulfilling. Here is the catch that is necessary to understand if one would understand what part is played in the entire picture that may be termed psychological, or physis, or what Socrates called the soul. We will not split hairs just now about these similar and differing conceptions.

If our original postulate be correct that man is a billion year time-bound series of structuralized experiences with Nature then it can be understood that the vast majority of his activities take place absolutely beyond his knowledge, i.e., beyond his conscious perceptions. Attention has been called to the chemical bindings, reflex inhibitions and reflexes and psychological repressions that protect him from instant response to all of the stimuli about him, and which if such traps or devices were not there would reduce him, as sometimes does happen, to that situation of the humorist who would ask "What happens if a chameleon be placed upon a Scotch plaid?" Out of this we emerge with a statement cast in the form of a proportion.

As from minute to minute is to a billion years so are our Conscious reasons for doing things to the "Unconscious" processes that really bring them about.

This means then an entirely new technique has to be employed to get at the truth locked up in the wisdom of the body, i.e., the "Unconscious." Before entering into this new technique, as a technique, let me briefly outline what it has seemed to teach us and I do so in the next diagram which would offer a picture of our mental systems. This is slightly modified, for our purposes, from the ideas that Freud has conceived. This egg-shaped figure (Figure 4) may be said to represent three essential parts of our mental systems.

During the billion years of accumulation of experience there was fashioned a vast variety of automatic responses to Nature's stimuli to which the general term, the *Id*, might be applied. All forms of life have a psychic life, for by psychic we would here mean *total response*, or purposeful pattern action. In higher forms there developed out of the *Id* a perceptive system which became what we call "conscious" when by reason of environmental fluctuations automatic adaptive action was faulty. Such fluctuations needed quick sizing up in order to alter older structural repetitive habitual actions. To that part of the *Id* which was in conscious touch with reality as a tester, Freud, in his metapsychology, gave the name of "Ego." This "Ego" must not be confused with the popular term "ego" which more properly is termed the *Self*—or for myself I prefer the term the "M-ego."

FIGURE 4

Purely schematic diagram of the arrangement of the mental apparatus. Physical-chemical-biological experiences and impulses operating as primitive id forces—controlled for socialized expression (creative libido) by inhibiting, repressing, and suppressing forces of the Ego and Super-Ego.

An outstanding function of this part of the mental system, the Ego is to suppress and to repress the urges, or impulses, or action patterns of the Id which would be disadvantageous to the self, the individual, or to society. We speak of them popularly as self control, judgment, reason, logic, etc., etc. Through the study of science has come the richest store for this guiding instrument of the Ego to suppress consciously and repress unconsciously powerful Id forces.

As Freud studied dreams carefully he noted an extremely interesting series of phenomena such as a chemist might, by analogy, note in the process of fractional distillation or its reverse. He saw

that another system was at work changing the crude Id symbols, fractionating them so that they could come to some form of expression acceptable to the individual's Ego. He called this "Censorship" and it too was of the nature of repression—not "Censor" as has been so widely written. It is a term for a dynamic "process." Further consideration led Freud—and I speak very, very briefly here of this highly important part of the mental systems—to call this the Ego-Ideal or Super Ego, because it was largely built up from childhood upon precept and example—i.e., upon authority, first of the father and mother images and later by others. In the popular parlance one aspect of this Super-Ego is what is known as "conscience." It is somewhat related to what some people speak of as intuition. Dr. Brill has written of it partly as "Unconscious Insight."

Consider for a moment the diagram—where it will be noted that the Super Ego is wedged in between the Id and the Ego—one part in contact with the Unconscious, there reaching through the preconscious or foreconscious and at its upper level in contact with the "Conscious." Here is a sort of balancing, repressing system working as an auxiliary to the repressing system of the Ego. It is certain that certain processes in the "Id" will always be inaccessible to conscious control: repression is absolute. How much no one yet knows and this is of great importance to the student of so-called organic disease processes. That which from moment to moment is held under by repression but maybe made accessible by effort or by other factors is the *foreconscious* or *preconscious*: That which occupies, as it were, the center of awareness we speak of as *conscious*. It will be seen that Freud's formulation here is not one of location but one of dynamics. There is no such thing as *in* the unconscious; unconscious mind, etc.; such are faulty phrasings of this general conception. If to use a chemical simile one says that gasoline is "unconscious" in crude oil, but by a definite heat and pressure technique can be isolated out, i.e., be made conscious, one can get a rough idea of how these terms are understood. The "Id" is the crude oil. Should I change my metaphor to one more mechanical and very rough, think of a running internal-combustion engine of a Rolls-Royce car turned out after a billion years of experience in building. The motive power comes from the Cosmos of our first diagram. It runs day and night and is always on its way (Immortality of the Race). Its goal is some definite place and purpose (Object and Aim). Its patterns of action are the roads that lead there. The Ego in our scheme is the steering gear and the gas feed. The Super Ego—the hand and foot brake. If one is perfectly clear as to the place and the road, one needs but to step on the gas and steer with judgment, ever alert for some variable in the environment to auto-

matically shut off the gas or suddenly to put on the foot brake or if needs be suppress and repress all movement by the hand brake. The human motor only stalls with death.

Why is all this complicated series of dynamics necessary? Because from the cradle to the grave some parts of the mental systems are called into action. In childhood the Id forces are all powerful and the Ego is weak. The care of authority, the "Super Ego," is necessary. Here is where religion has been of so much value in the gradual development of man from the primitive to the present.

For the weaker the Ego, as with the infant, the greater must be the parental care for the individual. In a civilized community the State must play a similar role. For the weaker the Ego the greater the Fear needed to control, hence at the lower levels of the Super Ego one finds magic, superstition, ritualistic observances, etc. As the Ego grows and begins to understand physical and chemical realities the needs for authority outside become less and less and little by little the creative and destructive forces of the Id are subjected to greater conscious control.

In diagram 2 the life pattern was roughly divided into four stages. We might have been Shakespearean and made seven but four are sufficiently illustrative of the general idea. In the Archaic period (intra uterine), the libido is actively creating organs to fulfill the ancestral hereditary patterns in structure and function. In the nine months the libido has rapidly recapitulated the ascent of life from protozoan to mammal. A piteous, helpless animal at birth, but with a richer heritage behind it than before it. In the next 7 years, to relapse to Shakespeare's numbers the adaptive harmony of the organ needs is to be established. Here environmental forces are more variable than in the intrauterine bath. There is great rivalry among these various organs. Each seeks its own functional satisfactions by obtaining pleasure and avoiding pain by hook or crook or by the reality or the phantasy pathways. It is to this period that search will have to be directed for the roots of those organic disorders with which psychopathology may be concerned. As the personality enters into the conscious stage.

Cogito ergo sum" of Descartes the individual enters a "Narcissistic" stage! "Papa look —

Mama look," "everybody look at me," "at my this and that"! The libido Id strivings having obtained a fair degree of organ satisfaction now is focussed on the entire Myself, the "Me ego." I love me is the keynote of this, roughly speaking 7-14 year old developmental stage during which certain organ supremacy of striving is maturing. Then man enters the puberty period and his greatest shove forward towards "Id" impulse gratification takes place. With the exception of his Ego organ—the brain chiefly—all of his or

gans are as mature as they are going to be, speaking generally and for the average. It is at this period that a great deal of personality breakdown takes place for which Morel, the penetrating French psychiatrist, coined the expression—"stranded on the rock of puberty" and which marks the period when personality development is subjected to the greatest whirlwinds of environmental stress because of the force of the Id impulses. Here is where a well-balanced super-ego, from successfully adapted parents plays an important role and when ignorant, bigoted and malignant forces of magic, superstition, and false authority of education, religion or social activities start conflicts within the mental systems which augur ill for the developing individual.

Two concurrent trends of action patterns have been maturing throughout these four stages. In Diagram 5 is roughly shown the evolution from the infantile to adult organ libido utilization. At first the child lives only to breathe (and holler), then to eat (and swallow), then to urinate and then to defecate. Here prudery "a la Comstock, Sumner and Co" suggests Latin terms for the latter two homely words of repressed or suppressed enjoyment. The Latin takes the fun out but admits a wider expression of gratification. What one loses thereby in quality perhaps is evened up in quantity, this sort of balancing between primitive joys with their more austere social permissions in modified form is the great work of the Super Ego and Ego inhibiting and

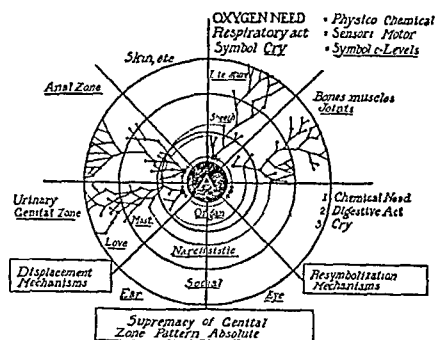

FIGURE 5

repressing systems. Thus by way of crude illustration one may say that the primitive joy of working over one's feces in the colon may be sublimated in the activities of the sculptor or dabbler in oils and paints. The plumber, hydraulic engineer or creator of "Muscle Shoals" works out to varying degrees of complete mastery the omnipotence that once gripped the bladder and started it on its pattern of eons of preparation

I might, had I the time and, you the endurance, trace out from the acorn of every organ's mastery of its destiny to the oak of its ultimate supremacy in the orderly socialized distribution of the titanic forces that reside in the Id of Everyman.

Of one special chapter in this evolution, that of the "supremacy of the genital" functioning, millions of words might be spoken and none ever the same that would trace the nascent impulses through organic growth, through adolescent self love, to object love and finally to the building of those values of the most supreme achievement in human society. If to that force the word "Libido" be attached I would remind you of its far reaching importance in every bit of living endeavor.

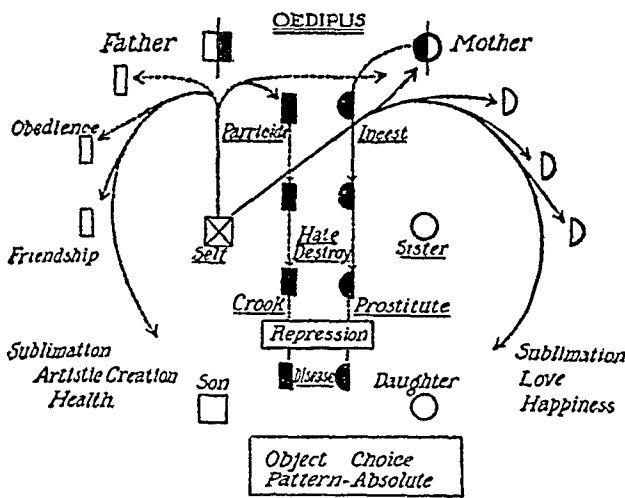

FIGURE 6

And finally to my last diagram which would seek to illustrate what Freud has called the "nuclear" complex in the human libido distribution, patterning it after the intuitive insight of Sophocles' tragic drama of King Oedipus. Were you to come with me into any one of our State Hospitals, you would very soon be amazed at the frank expressions of the Oedipus situation from numerous patients. As I have previously reminded you many of these patients are suffering from varying degrees of "total recall." The past of the "Id" breaks through the repressions of both Ego and Super Ego and the faint or stark skeletons of the Oedipus nucleus stand forth. Like Mark Twain's celebrated story of how human speech at the North Pole became frozen and then thawed out in a claque of strange sounds as the temperature became warmer, so the repressed material breaking through gives one a superior insight into "what everyone of us is dragging behind him unawares."

The pathway taken by the Libido in its developmental investments of objects away from those of the uterus, the cradle, the kindergarten, away from infantile bladder, or bowel, or muscular, or

skin pleasure—pain attachment to identifications of mother (pleasure principle) or father (reality principle) is roughly sketched in these two diagrams.

And this leads to the final statement and explanation of what is involved when certain types of organic disease are being dissected psychologically to endeavor to find the deviation from Object and Aim in the libido strivings.

To understand this attention might first be called to the universal mechanism of *Conversion* that mankind uses to as it were "pass the buck" to his Ego by paying penance to his Super Ego.

In its mildest forms it is seen behind the innumerable ready excuses that one gives when one would avoid something. Such are the innumerable make-believe "headaches" and "fatigue states" to get out of doing something and to continue doing something more desired. More heavily loaded conflicts bring about, not these semiconscious subterfuges, but repression, which pushing more strongly throws the conflict into the Unconscious. The Id, however, always demands expression and the Super Ego takes hold of it and says, "Yes, you can have it but it will hurt you." Here the hysteria conversion mechanism is in evidence. The punishment penance paid to the Super Ego blinds the Ego as to the real significance of the Id craving and so one has the innumerable kinds of bodily "organ neuroses" with which the hysteria literature is full. Now only one step further is needed to convert a benign conversion process which is called hysteria into a malignant conversion process which can make an "organ neurosis" over into an organic disease, when, for instance, a grasping, impatient stomach develops its peptic ulcer or an intestine its duodenal ulcer.

The one step further is simply a question as to the amount of libido investment that is frozen in a fixation at an organ erotic level and its persistence. I need hardly remind you how a frozen investment can upset one's financial adaptation after October, 1929's experience. The hysterical non-malignant conversion outbreak is a safety valve, a defence reaction against either specific local social environmental hardships or against discomforts of civilization at a more general level.

Finally I would show on the screen a rough outline of how a chronic malignant conversion might take the form of a hypertensive nephrosis. It could occupy me many hours discussing this one of similar mechanisms some of which I have put in print as have Groddeck, Deutsch, Allendy and others since my initial contribution to this type of problem in 1916.

Very briefly a distracted husband came to me demanding I save his wife. The doctors, he said, gave her six months to live. She had Bright's disease and needed a diet and rest in bed or she would die. It is no great news to you to be told

that some of us are a bit pessimistic and alarmists and I told him so and to calm down and tell me the story Here it is on the chart

A woman, aged 36, married, children 2, ♂, ♀, ♀, nephritis hypertension

Symptoms

Headache four years Blood pressure 240/250 mm
Albumin Diminished urea output Retention Asthenia
Edema Dyspnea. Constipation + + + Slight momentary lapses

Behavior

Able, energetic cultivated interests in home, children, society Two girls in family Devoted father, beautiful much admired mother Large family group of professional people Never peculiar No eccentricities

Unconscious

Oedipus evolutions, defective Strong father fixation
Rejection of male Homophilic Supremacy of genital zone, defective Urinary fixations Strong anal erotic components

FIGURE 7
Chart of symptoms of the case

I told him I had not treated kidney disease for many years but I would send her to the best hospital I know and take her over the works and then translate to his engineering mind the verbalizations of the internists They practically said "she had high blood pressure because she had kidney disease and kidney disease because she had high blood pressure" Being an engineer this did not go far with him, nor her as far as that goes and I agreed to do a little exploration of the "Unconscious" in the terms here already briefly sketched And since the dream is the royal road into the Unconscious my exploration began with the dream, the first one of which, she recalled while in the hospital was as follows

It was in the country somewhere, a path led from a house to a country road Coming from right to left, at a lickety-split rate of speed were two men in racing sulkies As they swept by in a cloud of dust, a woman ran out of the house towards them with dishevelled hair and apparently shrieking to stop—or what, she was not sure They went on their way up a steep hill without slackening their pace and when they got to the top one turned to the left and ran into a stone wall two feet high and smashed horse and sulky and everything to pieces

"Well," I said, "a cheerful picture and suppose you did a thing like that what would you think about it?"

"What do you mean?" she replied

"Well," I said, "an ancient Greek philosopher, Heraclitus, once said something like this This was 500 B C and long before Freud "For the waking there is one common life, but for those asleep, each one turns aside to his own privacy And do you imagine you could do with impunity what you dream? Is it not because you lie still and do not act that you can indulge your fancy?"

"Well," she said slowly, "one would be crazy to do a thing like that in the dream"

"Good," I said "let us see wherein there is a crazy drive that is destroying you" Here, you see, there is a different method of approach than the blood pressure—kidney disease—dog chasing his tail—mode of explanation

In the methodology of psychoanalysis it was very soon obvious wherein this woman was out of line with the inner laws of nature She was at odds with her own instinctive patterns The race instinct pattern was all wrong In spite of the fact that she had had 4 children she had been frigid Even clitoris manipulation left her cold Her organ erotic fixation was even more primitive than that, it was urethral She got her supreme gratification at that level She urinated quarts to get it, and drank gallons to get the quarts, and in a-b-c short order, the heart, the blood vessels and finally the kidney had to hand it along in double time and finally rebelled This is not the whole story It is only a glimpse at the main issues It would take many hours for me to outline to your or my satisfaction how this particular mode of organ outlet finally was chosen and what was the significance of early identifications and what were the patterns taken up into her "Super-Ego" And how this failure of the Super Ego to work with the Ego and the "Id" destroyed her, just as she had destroyed the man (her father) in the racing sulky in her dream

When the ancient psalmist said, "Vengeance is mine, I shall repay, saith the Lord," he was only saying in an intuitive lingo what the ancient dramatists said when they talked about Fate and what the modern scientific imagination calls the study of the immutable laws of nature When we refuse to get in line with nature, as registered in the faulty purposes of life—i.e., our mental states—even the kidneys, the blood-pressure and urea, proteid, ionic milieu become involved and this is but one formula for many diseases

She did not die in six months—she lived eight years of a useful, busy life and only went to bed in the last month of her life Innumerable details of what psychotherapy did to her blood pressure and her kidney states might be detailed here I might even be able to show how she escaped from the vigilance of the Ego and finally how the Super Ego forced the punishment of death But this would be a long, long story

NOTE

(Dr Jelliffe then demonstrated lantern slides with explanatory remarks of the malignant formation of a bony tumor, the development of oculogyric crises in post encephalitic states, a chronic esophageal diverticulum case that developed a psychosis when operation cured the diverticulum, a case of duodenal ulcer of psychogenic causation and an interesting chronic dyspepsia with rumination and cardiospasm which

was traced back to the infant's mastery over her mother when at the breast. Some of these cases have been reported more fully in special articles. See Bibliography.)

EARLY MEDICAL HISTORY OF THE MOHAWK VALLEY*

By ELLIS KELLERT, M.D., ELLIS HOSPITAL, SCHENECTADY, N. Y.

MEDICAL practice, in the Mohawk Valley, began long before the advent of the white man. Through numberless centuries the functions of the physician among the aborigenes had been combined with those of the priest, a condition that existed among all primitive and pioneering peoples. To the native American, the Indian, injuries sustained in accidents, the hunt and warfare were comprehensible but the metabolic or infectious diseases which quickly or slowly sapped the individual vitality, or those epidemics that swept the tribes leaving mourning in every tent, an unseen withering power, struck terror to the heart of the simple-minded savage. Toward such events, he not infrequently adopted the attitude of the fatalist and either abided the result or fled. In certain localities in America, the sick natives were without aid of any kind, not even the cymbals of the gaudily attired medicine man and when stricken, were deserted and allowed to perish like cattle. Elsewhere the natives were abundantly able and willing to help the sick. They used herbs, leaves, roots, and even certain minerals many of which were known to the white invaders and which today are used by the medical profession. Chief among these are quinine used for fevers, particularly malarial, and sulphur for skin diseases although the latter were rare except for ulcers. Rheumatism and agues were said to be common.

Physically or mentally handicapped individuals could not survive in the struggle for

existence among primitive people and so it was that the early explorers found "an almost barbarous people well proportioned, without blemish, strong in body, and no limping, crippled, lame, cross-eyed or blind ones." The exigencies of war or the chase did not permit such to survive. Yet illness was not rare among them for the strange white man who came to visit was often besought to aid a sick one. That many of their diseases were self-limited is suggested in the frank statement of Father Simon Le Moine who cured the sick and who writes in 1654, that "they took me for a great medicine man, having no other remedy for the sick but a pinch of sugar."

In the Mohawk Valley the Indians were of a particularly intelligent and advanced order as evidenced by their political unions, their arts and agriculture and their influence over that large area extending from the Mississippi River to the Atlantic Coast. The restricted diets to which the Indians were subject in winter must have resulted in deficiency diseases at times, were it not for their custom of gathering cranberries which although not dried would last the whole winter. After months of a pure meat diet without a single fresh vegetable, scurvy would most certainly have appeared were it not for the use of the cranberry with its antiscorbutic vitamin.

The ambitious Dominie Megopolensis, also recognized as a physician, came over in 1644, to live among the Indians, learn their language and possibly write a book. In fact, he did attempt to formulate an Indian grammar but was much confused by their use of words and

* Address by the President, before the Medical Society of the County of Schenectady, December 1, 1931.

phrases with which he thought himself familiar, and almost believed what he was jokingly told that the Indians probably changed their language every two or three years. He noted the absence of a marriage custom and that women after giving birth to a child, regardless of weather, would wash themselves in cold water or snow and go about immediately performing the usual drudgery. They could not be persuaded to lie down, fearing, that to do so, would result in death.

Indian girls allowed their hair to be cut all around thus explaining the origin of the modern bobbed-hair craze. They married quite young. When unwell for the first time, they were kept in a separate house apart from the men and supplied with food on a stick. There they remained until sick a second time, when they emerged and were allowed to select a mate. Despite the hard life of the female Indian she often lived to a ripe old age. Officers in Gen. Sullivan's expedition frequently noted in their diaries, the finding in the deserted villages of squaws about 100 years of age.

Our real interest, however, lies not with the Indian and his medicine man but with the white physician whose history dates back to a much earlier period than is commonly realized. Canada was settled many years prior to New York or New England and the first man to bring out his family and make his home in Canada was Hebert, an apothecary. The first man to found a seigniory, was Dr. Robert Gifford of Beauport and to him King Louis XIV granted a patent of nobility, the first to be awarded an inhabitant of Canada. At a time when the early English and Dutch settlements had extended but little beyond the Atlantic coastline it was a physician who travelled up the Mohawk Valley and gave many hundreds of Indians their first view of a white man. Previously on rare occasions the natives may have seen a French-Canadian *coureur de bois* or bush ranger who perhaps differed but little from themselves. That physician, one of the first white men to penetrate the dense forests of the Mohawk Valley came on a voyage of exploration and his account of that journey is most interesting.

The Dutch West India Company, which assumed the task of settling the newly discovered lands, felt the necessity of furnishing medical service. Each large ship as it left Holland was usually provided with a surgeon who remained among the colonists either as a practitioner or a settler. One of the earliest of these ship-surgeons was Harmen Meyndertsz Van den Bogaerd who came over in 1631, as surgeon of the ship "Endragh" or "Endracht." He landed at New Amsterdam where for a long time he practiced and un-

doubtedly was the first licensed surgeon to locate in New York. But Van den Bogaerd evidently was afflicted with the wanderlust for in 1633, he became surgeon to Fort Orange, the present Albany, where he achieved notice because of his activity in saving the life of Father Joques who had been captured and tortured by the Mohawk Indians.

In about a year, however, Van den Bogaerd must have tired of waiting for the healthy Dutch stock to employ him for on the 11th of December, 1634, together with two companions, he started on a tour of exploration and travelled up the Valley a distance of about 120 miles. This doctor-explorer was an out-doors man. He knew the woods and trails, was accustomed to live out-doors in summer and winter and the calls of beasts and birds in the virgin forest were pleasant sounds to him. The three explorers travelled the barely perceptible Indian trails or pushed through dense woods, a short distance daily. They slept out in the rain and snow, at times when it was almost unbearably cold and not infrequently walked all night in order to keep warm. When Willem Tomaassen's legs became swollen from the march the doctor made a few cuts with a knife and rubbed bear grease over them. This let the fluid out and reduced the swelling. No first-aid kit, no anesthetics, no antiseptics, no dressings. The march was resumed. They were drenched by the rain; and shoes and stockings froze to the skin. They noted the abundance of flat land, so dear to the Dutch heart, the many fir trees, the favorable sites for settlement and the strategic points for building forts. The hills and streams were also charted; likewise the Indian castles and villages, and the distances separating them. They mingled with Indians who never before had seen a white man, but all were friendly, polite and hospitable; especially after the receipt of presents. In fact, one cold night, a chief loaned Van den Bogaerd a lion's skin which truly was warm, but in the morning he found himself possessed of a hundred lice, something he had not intended to borrow. The Indians were dirty, and yet there was little evidence of skin disease. He found them using sulphur for many conditions especially sore legs resulting from long marchings. But of all their discomforts he makes no complaint except over the lack of a sense of shame on the part of the savages who crowded about at their meals, in their sleeping room, and even when the whites attempted to go to stool.

While at one of the villages he was asked, as so frequently happened, to see a sick man and on entering the room found there two medicine men. The following scene took place: "Lighting a big fire and singing, the Indian doctors closed the house carefully and each of them wrapped a snake-skin about his head. They washed their hands and faces and laid the sick man alongside

jury the victim frequently revived and often lived to a ripe old age.

Scalping was performed in the following manner: a knife resembling a Bowie knife was used and a circular incision made, starting at the hair-line on the forehead. By means of a sudden jerk with the free hand or even the teeth, if the hands were both occupied, the Indian tore the scalp from the skull. The scalps were stretched on small hoops and tanned with the hair on and marked for identification.

When the Revolutionary war broke out, the British in Canada offered a reward for scalps regardless of age or sex and consequently scalping became a big business. For the scalps of ordinary individuals, eight dollars were paid, for those of officials, as high as twenty dollars. The scalps were sold in Montreal where they were gathered in great heaps. What a pathetic sight; the pieces of skin with masses of long black hair, others with shorter gray hair and many, many others of smaller size with light colored ringlets, mute evidence of some horrible tragedy on an isolated farm. The whites themselves, occasionally took to scalping and skinning, for in the diary of an officer in Gen. Sullivan's army we read how, one day, he found a number of dead Indians and skinned two from the hip down for boot-legs: "One pair for the Major and the other for myself."

Many epidemic diseases swept the Mohawk tribes particularly after the coming of the white man. In 1663, small-pox was very prevalent in Beverswyck and Rensselaerswyck and daily deaths were recorded. It is said that a thousand Indians died as a result of this infection. In 1720, the Mohican Indians suffered from yellow fever, which spread from New Amsterdam to Albany by means of shipping and thence along the Valley. Again in 1746, a disease thought to be yellow fever raged among the Indians and destroyed many of them. The epidemic began in August and ended with frost. It was associated with a crisis on the 9th day and the patient who survived that day usually got well although many were left in a state of imbecility and others with swollen legs.

The influence of disease on the rise and fall of nations is not generally appreciated. Many an ancient civilization crumbled and disappeared as a result of pestilence. Ancient Greece withered beneath the onslaught of the malarial parasite and many other more modern nations might never have been born or survived, as a result of that same parasite were it not for the very fundamental discoveries of a Mohawk Valley physician, Theobald Smith, who first pointed out, as a result of careful scientific experiments, the role of the insect in the transmission of disease. Were it not for disease the United States of America might never have endured. In 1775,

when war seemed imminent, it was deemed expedient to keep the New York Indians neutral, for they guarded the natural passage to the west. After a great meeting, the tribes returned to their castles and soon thereafter an epidemic broke out among them which greatly reduced their available warriors. The British agents convinced the Indians that they were being punished by the Great Spirit for not taking up the hatchet of the King, which they readily believed and joined forces with the English. They accomplished little except to harass the frontier towns and perpetrate several massacres. The Indian depredations led to Gen. Sullivan's expedition which so severely punished the red man as to forever destroy any further opposition from him in New York State. By the year 1886, the Indians were reduced to 5,000 or about an eighth of the original number.

In 1832, cholera appeared in the valley settlements and was thought to be due to the wells. The water, usually clear and sparkling, was examined by prominent chemist-physicians who pronounced the samples "all to be free from any impurities which could be injurious to health." The doctors had made chemical examinations only. Pathogenic bacteria were unknown then and doubtless the water was full of cholera and dysentery microbes. Owing to the public suspicion of water, beer and cider were the common drinks.

One hundred and twenty-three years ago, the Valley saw established a medical college. The resourceful, intelligent physicians of central New York always alert to advance the science and art of medicine and who believed above all things in self-help, decided to establish a medical school. The hamlet of Fairfield, in Herkimer County, eight miles from Little Falls, was selected, probably because of its central location and because living costs would be low. There, a stone edifice was constructed in 1812, which became the College of Physicians and Surgeons of the Western District of the State of New York. The building measured 63 x 38 feet, was three stories high, contained a museum, anatomical theatre, dissecting room, class rooms, etc. A charter from the state was obtained together with grants totalling 15,000 dollars.

The college issued an announcement setting forth its advantages and making a plea for aid. We find the following statements: "Mineralogical specimens will be thankfully received for the cabinet, and if gentlemen desire an analysis they can be gratified." "The Professor of Obstetrics has been furnished with a good machine." This statement probably referred to a mannikin. "During the session of the college, advice will be given and operations performed gratuitously, in all surgical cases at Fairfield or its immediate vicinity, provided the class can be present." The

school flourished until 1840, when it closed because of the increasing demand for clinical and laboratory facilities which the small village of Fairfield could not supply. During the 28 years of its existence, 217 students were graduated and 19 subsequently became professors in other institutions, a fine testimonial to the character of the teaching by the faculty of that school.

The faculty consisted mainly of physicians who came from various parts of the State and delivered a concentrated series of demonstrations and lectures of about three months each. The faculty group was headed by a Dr. Willoughby who, together with a medical partner lived in a log cabin between Fairfield and Newport. These men, both bachelors, kept house, cooked and washed for themselves and made their daily rounds on horseback through the thick forests to the widely separated farmhouses. Willoughby was the professor of obstetrics at Fairfield, the man who operated the machine and managed the school. Patients must have paid their fees in those days for this backwoods physician subsequently removed farther west and founded and liberally endowed the Willoughby Medical College in Ohio.

The group of teachers included many well known men but most famous of all were the Becks of whom Theodric Romeyn Beck may be stated to have been the most renowned physician connected with the early history of the Mohawk Valley proper. The Beck family were of English origin but intermarried with the Dutch population.

Dr. Theodric Beck was born at Schenectady, August 11th, 1791, became a student in the grammar school, entered Union College in 1803 and graduated in 1807, at the age of sixteen years. He graduated in 1811, from the College of Physicians and Surgeons of New York and subsequently was associated with the famous Dr. David Hosack of New York City. He established himself in practice in Albany and became Professor of the Institutes of Medicine at the Medical school in Fairfield. He was a notable teacher and was greatly revered by students and colleagues. Beck also lectured on medical jurisprudence, a subject in which he attained great eminence. He wrote a thesis on Insanity. Teaching and lecturing soon occupied so much of his time that he gave up practice and in 1817, became principal of the Albany academy, during the time of the famous Joseph Henry. In 1829 he became president of the state medical society and so pleased that organization that he was re-elected the following year and also a third time, an honor accorded to but few men. Beck's first address was entitled "Medical Evidence" and in it he discussed the interests of the public and profession. He particularly urged the appointment of trained and experienced men to perform

post-mortem examinations realizing that special work in medicine required special training. In his second annual address, just about 100 years ago, he again stressed the importance of the fundamental studies such as anatomy, pathology, chemistry, materia medica, and spoke of the antiquated medical theories that were being discarded. Of the pathologist he said, "He proceeds to his high office at the risk of health—often, indeed, of existence." In his third address, he spoke on small-pox, urging compulsory vaccination. Only 26 years earlier, the first inoculation in America for small-pox, was performed in Boston. It will be recalled that in 1747 Gov. Clinton had prohibited vaccination in New York and its environs.

Beck was also interested in the museum of natural history, in the geological survey of the state and also investigated the minerals of the country. But medical jurisprudence continued to be his main study and culminated in the most authoritative work on that subject ever printed. Issued first in 1923, Beck's Medical Jurisprudence has passed through ten editions; a work that acquired international fame, that startled Europe with its scientific insight and comprehensive knowledge. In it is a chapter by his brother John on the subject of infanticide. This article, even today, is regarded as standard.

After a prolonged illness of obscure origin and in which gastro-intestinal symptoms predominated, Beck died November 19, 1855, at the age of 64 years. An autopsy was performed, probably by Dr. James McNaughton in the presence of seven other intimates of Dr. Beck. These gentlemen found a large heart with calcification of the mitral valve. "The coronary arteries were ossified," is a statement in the report. It is interesting to note, at that early day, reference to coronary sclerosis. There was thickening and induration of the pyloric orifice. Microscopic studies were not made in those days and the real nature of the stomach lesion will remain unknown but it is not unlikely that it represented that rare form of gastric cancer called linitis plastica.

Because of popular prejudice and lack of skilled observers, autopsies were very rare. The first post-mortem examination in the state was performed in 1690, on the body of Gov. Slaughter who died suddenly following a drinking party which celebrated the execution of Leisler and Milborne, who had rebelled against the governor's authority. Foul play and poisoning especially were suspected and because of great public clamor, an autopsy was ordered which was performed by Dr. Johannes Kerfbyle—assisted by five physicians. After a complete examination it was found that "he died of a defect in his blood and lungs occasioned by some glutinous tough humor in the blood, which stopped the passage thereof and occasioned its settling in

the lungs." Certainly one might apply that description to the modern diagnosis of pulmonary embolism, an interpretation suggested by Walsh.

One of the reasons for the decline of the medical school at Fairfield; the Old Pioneer School, as it was then called, was the opening of the Geneva Medical College in 1835, which attained considerable publicity over the enrollment of a woman student. Miss Blackwell, the student, sought to enter the college but the faculty did not wish to admit her and also did not wish to incur criticism for failing to do so. The professors felt confident that the student body would not want a female in class and so referred her request to the students. The students, however, voted unanimously to admit her to the college thus demonstrating how little faculties can judge the temperament of student bodies. Miss Blackwell ranked high in her studies and graduated and the faculty subsequently testified that the presence of a woman student "exercised a beneficial influence upon her fellow students in all respects." Nevertheless, a few years later Miss Blackwell's sister requested admittance to the school, and this time the faculty did not permit the students to vote on the matter and took sole responsibility for rejecting her. Shortly afterward, in 1837, this school because of diminishing classes, merged with Syracuse University becoming its medical department. After the close of the Fairfield school, the fine museum collection by Dr. McNaughton was transferred to Albany.

It was in 1820, that Dr. Alden March began his demonstrations and lectures in anatomy in Albany. He was capable and successful and his classes became so large that in 1830, he delivered a lecture on the establishment of a medical college in the city of Albany. He discussed the organization of such an institution and even considered full-time salaried clinical professors, something generally believed to be a recent invention. He did not approve such officials, however, for he said, "These professors, though able men, would soon become mere theorists, if not visionary speculators. They could not be sound, practical men, which seems to be at least important, if not absolutely necessary, in most branches of our profession." At that time the population of Albany was about twenty thousand and there was no hospital. He pointed out that most of the students at the Fairfield school came from eastern and central New York, that Albany could well support a medical school; that students could obtain good board and lodgings for two dollars a week and complete tuition for sixty dollars. Most medical institutes of that period, relied entirely on the reputation of one individual to attract students but March believed that a group of twelve or fifteen men of medium talents

but working in harmony could accomplish more than any one individual regardless of his ability. He also recommended that with the college there be established a Hospital and an Asylum for the Insane; a combination that after many years came into existence. Shortly after the closing of the Fairfield school the Albany Medical College was established in 1839, two years before the birth of one of its most eminent students and teachers. Born in the town of Root, near Canajoharie, in 1841, Dr. Albert Vander Veer obtained his preliminary education under the tutelage of a country practitioner. He became a student of the Albany Medical College during the first year of the Civil War and was then sent to the National Medical College in Washington where he received his degree in 1862. Returning to Albany in 1866, he began the practice of surgery and soon received appointments in the college and hospital. Dr. Vander Veer was among the first surgeons in the country to perform abdominal operations and attained a national and international reputation as a practical surgeon and medical educator. He received the highest honors accorded by State and National medical societies and was decorated by foreign potentates. He was to practical surgery what Beck was to medical jurisprudence and it is of interest to know that two such eminent men were born and labored in the Mohawk Valley.

The medical societies of the state were the original licensing bodies and so we find the Medical Society of the County of Schenectady organized June 11, 1810, under "An act to incorporate medical societies for the purpose of regulating the practice of physic and surgery." Article 5, of the act, provided that the censors should meet, on request, to examine all students in anatomy, physiology, surgery, midwifery, materia medica, pharmacy, theory, and practice of physic, and chemistry. The initiation fee was one dollar and dues, two dollars, payable quarterly. If a member failed to attend a regular meeting he was fined one dollar.

The members engaged in the highest type of medical practice characteristic of the times. No one was permitted under penalty of loss of membership to pretend that he possessed a secret remedy or cure for any disease not known to the profession as a whole. A fee schedule was also adopted and it was considered proper to charge one dollar and not less than fifty cents for visit and medicine for ordinary cases.

In 1841, owing to internal dissensions, meetings ceased for a period of 28 years. In 1869, the society reorganized and adopted a new set of by-laws January 11, 1870, from which date the society has enjoyed active scientific work and harmonious meetings.

SPOROTRICHOSIS IN NEW YORK STATE

By J G HOPKINS, M D, AND R W BENHAM, Ph D, NEW YORK, N Y

From the Laboratory for Medical Mycology and the Department of Dermatology, Veneral Disease Clinic, College of Physicians and Surgeons, Columbia University, New York.

SPOROTRICHOSIS is an infection which is usually confined to the subcutaneous tissues and the skin but which may occasionally attack internal organs. The various clinical forms were studied and classified by de Beurmann and Gougerot¹ and their work has been well summarized by Foerster.² Grutz³ has recently published a full discussion of the subject.

1 Lymphangitic form The most common form of sporotrichosis in the United States is a localized infection which begins with a primary lesion usually on exposed parts of the body, most frequently on the backs of the hands or fingers. This sporothric chancre is a granuloma which may form an abscess, but is more frequently verrucous or covered with moist vegetations. There is a variable degree of ulceration. It is surrounded by a red inflamed area which is moderately infiltrated. Usually secondary nodules develop along the course of the lymphatics draining the region. The nodules are at first freely movable, but later adhere to the overlying skin which becomes reddened, infiltrated and frequently ulcerates discharging a small amount of thin pus. The lymphatic vessels between the nodules are often so thickened as to be felt as hard cords. The regional lymph nodes rarely become involved. Infections of this type run an exceedingly long and chronic course if untreated. Fever and systemic symptoms are absent or mild. Extension to the internal organs is very rare. Solitary gummatous nodules and solitary abscesses have also been described as due to the sporotrichum.

2 Disseminated form In France a disseminated form of sporotrichosis has been more frequently observed. The lesions begin as rather hard subcutaneous nodules which are usually numerous. They appear scattered over the body as if resulting from a blood stream infection. As they grow they usually involve the overlying skin but the whole disease may run its course without ulceration. In some cases, however, all the nodules tend to form indolent ulcers of the type already described. DeBeurmann has described syphilitic forms in which the lesions fuse and break down to form extensive ulcers.

3 Epidermal form Although in most cases sporotrichosis begins with subcutaneous lesions, secondary superficial papular, pustular, or ulcerating lesions are sometimes seen in the neighborhood of the ulcers of the deeper origin. These were referred to by deBeurmann as sporotrichoides on account of their resemblance to papulo necrotic tuberculides. In some cases of facial infection the entire lesions are localized in the skin and form nodular crusted areas similar to those

seen in lupus vulgaris. Benedek has described a superficial form of sporotrichosis due to a different species of sporothrix from that found in the deeper lesions, and Guy and Jacob⁴ reported a case of intertrigo of the toes from which they isolated *Sporotrichum Schenckii*.

4 Sporotrichosis of the mucous membranes Secondary involvement of the mucous membrane of the mouth has been observed in the disseminated cases and Gougerot, Quellen and Escomal have described cases of primary infection of the pharynx. Sporotrichosis of the conjunctiva has also been observed and Wilder reported such a case due to a laboratory infection.

5 Skeletal Sporotrichosis A number of cases of sporotrichosis of the bones and joints and of the tendon sheaths and muscles have been reported. Some of these occurred without cutaneous lesions.

6 Visceral Sporotrichosis Pyelonephritis, orchitis and epididymitis due to the sporotrichum have been observed in patients with general infection. The question of pulmonary sporotrichosis is of considerable interest and has recently been discussed by Forbus.⁵ The fact that the sporotrichum has been isolated from healthy mouths, pharynx, and tonsils makes the finding of the organism in the sputum insufficient evidence of pulmonary involvement. In one patient, however, Shulman and Masson cultivated the organism on aspiration of tumor masses in the lungs which were localized by x-ray examination.

Diagnosis

The lymphangitic form of sporotrichosis begins with a chronic ulcerating and almost painless lesion of traumatic origin and followed by the development of nodules along the course of the regional lymphatics presents a characteristic picture that makes a presumptive clinical diagnosis possible. Pyogenic cellulitis, tuberculosis, syphilis and glanders must be excluded, although they rarely present a similar picture. Hodges⁶ and Shelmire⁷ have observed that tularemia may closely imitate sporotrichosis especially when aberrant subcutaneous lymph nodules along the forearm are involved. The prominent enlargement of the main lymph nodes usually present in tularemia and absent in sporotrichosis would seem important in the differentiation of these two conditions.

The disseminated gummatous form of sporotrichosis described by Gougerot also presents a strongly suggestive clinical picture. The localized forms of the disease may, however, closely

simulate syphilis, tuberculosis, blastomycosis, deep-seated trichophytosis leishmaniasis and granulomas due to drugs. The bone and visceral lesions also have no diagnostic clinical characteristics. The possibility of sporotrichosis must be borne in mind in diagnosis of all granulomas of obscure origin.

The most important means of diagnosis is direct culture from pus or an excised lesion. This is usually successful if made on Sabouraud's agar or other media of a pH of about 6.0 and grown at room temperature. The organism is practically never detected in smears of pus and rarely in sections from the lesions.

Widal and Abrami found that patients with sporotrichosis agglutinated suspensions of sporotrichum spores in dilutions of 1-100 to 1-500 and occasionally in 1-1500, whereas normal sera did not agglutinate above 1-50. Bloch and deBeurmann have obtained positive skin reactions with extracts of the organism similar to those obtained with tuberculin. (As the necessary materials are rarely at hand in an emergency, these indirect methods of diagnosis have been, in practice, of less value than the simpler method by culturing specimens taken from the lesion.)

Treatment

Sporotrichosis responds remarkably well to potassium iodide given internally in large doses. There are numerous reported cases where extensive surgical procedure has failed utterly and where cure followed the use of iodides. X-ray has apparently also been of value in treatment of the skin lesions.

FIGURE 1

Culture of *Sporotrichum Schenckii* in hanging drop showing typical clusters of spores at the end of short lateral branches.

FIGURE 2

Another hanging drop culture showing clusters of spores along mycelial threads.

Sporotricha

The organisms obtained from the large majority of the human cases of sporotrichosis resemble closely those originally described by Schenck and by Hektoen and Perkins. Strains vary somewhat in pigmentation, in the profusion of spores and in other minor characteristics. DeBeurmann has separated several species and varieties of the organism, but the differentiations that he has made have not achieved general acceptance. The careful studies of Davis indicate that the organisms called by de Beurmann *Sporotrichum Schenckii*, *Sporotrichum Beurmanni*, *Sporotrichum asteroides* and *Sporotrichum indicum* are all of the same species. Consequently the name, *Sporotrichum Schenckii*, is used in this report as synonymous with the more commonly used term, *Sporotrichum Beurmanni*. Two other distinct species have been recovered from human lesions—a *Sporotrichum Gougeroti* isolated first by Gougerot from a gummatous sporotrichosis and since reported in a few isolated cases and the *Sporotrichum Councilmanni* recovered once by Wolbach, Sisson and Meyer from a case of arthritis of the knee. *Sporotrichum Carougeaui*, *Sporotrichum Jaenselmi*, *Sporotrichum Lipsiensi* and *Sporotrichum Lesnei* are also apparently distinct, though rare, pathogenic species.

The organisms described as *Sporotrichum Dori* and *Sporotrichum Cracoviense* should probably not be classed under the genus *Sporotrichum*.

Sporotrichosis in New York State

Sporotrichosis is a disease of curious geographical distribution. It seems common in France

and in Brazil, very rare in England and Germany. Foerster collected one hundred forty-eight cases reported from the United States and there have doubtless been many others unreported. The great majority of these infections have occurred in the Mississippi Valley. The disease is apparently rare in New York State. We could find only four published cases originating here and in none of these was the diagnosis made definite by culture. Dr. Earl D. Osborne of Buffalo has told us of a case of his from which the sporotrichum was recovered. There may well have been other unpublished observations. In Sutton's textbook is a photograph of a case contributed by the late Dr. Wende of Buffalo, but no published account of it has been found. The first recorded cases were reported by Dr. G. H. Turrell,⁸ Smithtown Branch, Suffolk County, 1911. One was a boy of twelve, an inmate of the children's home, who presented two chronic ulcers on the toe and foot and a bluish-red fluctuating subcutaneous nodule on the back of the wrist. He later developed two similar lesions on the forearm and one on the scalp. The second boy in the same home developed similar nodules on the back of the hand and wrist. Smears taken from one of the ulcers showed, "an interlacing network of mycelial threads interspersed with sharply defined oval bodies." No cultures were made. The first patient had failed to improve under ordinary surgical treatment and in both there was marked improvement after administration of potassium iodide.

The clinical description of these cases makes the diagnosis of sporotrichosis highly probable. The microscopic findings were not convincing as spores are rarely found on direct examination of pus and mycelial forms have never been observed in lesions.

A third case was one presented by Dr. Lapowski⁹ at the New York Academy of Medicine, December 1918. The patient presented three nodular lesions on the anterior surface of the leg, the dorsum of the hand and a third extending around the right eye and adjacent portion of the forehead. The lesions improved under potassium iodide. No cultures or microscopic examinations were made. Neither Dr. Lapowski nor Dr. Wise who discussed the case would venture a positive diagnosis.

A fourth case was presented by Dr. Fred Wise¹⁰ before the New York Academy of Medicine in May 1921. The patient was an Armenian, age thirty-three, who had been in the United States only a few months. He presented a dime size ulcerated lesion on the dorsum of the right hand. There were also pea size subcutaneous nodules extending from the wrist to the shoulder. These nodules were hard and showed no signs of breaking down.

A case of sporotrichosis in which the diagnosis

was confirmed by finding the sporothrix in culture was presented by Dr. Howard Fox¹¹ before the New York Academy of Medicine in December 1921. The patient, however, was a sailor recently arrived in New York and the infection was probably acquired in the tropics.

The first case of sporotrichosis of which we are aware proven by culture and originating in New York State was observed by Dr. Earl D. Osborne.¹² We are indebted to him for the following report:

A young boy, age six, in excellent general health was brought in to me on June 27, 1928, with a history of having been cut on the forehead over the right eye two months previously. The cut was received while climbing a fence adjacent to which some shrubbery was growing. The cut had not healed although cleaned out and sewed up by a competent physician. The stitches had been pulled out and the cut opened up and had been draining for two months.

FIGURE 3
Colony of sporothrix recovered by Dr. Osborne from his case.

Examination revealed a linear lesion, one and one-half inches in length with a cystic, granulomatous appearance. A sero-sanguinous discharge was present. A number of small satellite lesions were present around the border. These lesions on pressure exuded a clear fluid, but no pus.

Smears and cultures were taken, examination of which revealed *Sporotrichum Schenckii*.

The lesion was treated with two skin units of 1-ray and the boy given 15 grains of potassium iodide three times a day. In three weeks time the lesion was completely healed.

Subsequent inquiry from the parents of this boy revealed the fact that there were numerous barberry bushes in the hedge adjacent to the fence.

We would like to present the report of a second case observed at the Vanderbilt Clinic last year. The patient S. K., was a Russian Jewess, married, age sixty-two, who was admitted in October 1929. Two months before she had injured her index finger with steel wool and a small pimple had developed from which she expressed a drop of pus. Following this, vesicular lesions appeared on the finger in the region of the puncture. A few days later she was in Monticello, Sullivan County, and as the finger was still sore she applied a poultice made of chopped leaves on the advice of friends. A week later the finger became more sore and inflamed and a group of pimples appeared on the back of the hand. From week to week, more pimples appeared extending up the arm, a few of them enlarged, looked like boils and discharged pus, but none of them hurt except when pressed. At times the entire arm became swollen and she had chills and fever. On

examination she presented a chronic paronychia of the index finger nail which when trimmed back exposed a granulating surface occupying the nail bed and a red swelling involving the distal phalanx of the finger. On the dorsum of the hand near the base of the index finger was an infiltrated plaque made up of individual, hard, papular lesions. Extending along the radial border of the wrist and forearm and around into the antecubital fossa was a chain of nodular lesions. Most of them were bluish-red and crusted on the surface. One was fluctuant. The most recent one in front of the elbow was of rubbery consistency. Several could not be seen, but could be palpated beneath the skin. There was no glandular enlargement, no skin lesions elsewhere and the patient complained of no systemic symptoms at the time.

Histological Examination

The lesion in front of the elbow flexure was excised and on section showed an inflammatory mass occupying the deep cutis and the neighboring portion of the subcutaneous fat. The mass was fairly well defined. The upper portion was made up of lymphocytes closely packed between fibrils of collagen. Fragments of disintegrating collagen bundles were distributed through the mass and scattered eosinophiles and mast cells. In the deeper portion were streaks of hemorrhage and wide areas of necrosis. In this portion there were numerous leucocytes, groups of plasma cells and large mononuclears and a few giant cells of the Langhan's type. Around the main mass were areas of lymphocytic infiltration around the blood vessels. This extended up into the papillary layer. These blood vessels showed marked swelling of the endothelium and degeneration of the walls which were infiltrated with wandering cells. Many blood vessels in the main mass were completely disintegrated. The epidermis was normal. No spores or mycelium could be found.

Animal Inoculations

An emulsion of portions of the excised nodule was injected into the testicles of two rats. These animals developed an orchitis and when killed, at autopsy a month later showed whitish nodules in the liver and spleen. The same sporotrichum was cultivated from these lesions. In further inoculation experiments multiple nodular lesions were produced in a monkey closely simulating the lymphangitic form of the disease in man.

Cultures

Cultures were made from pus expressed from the finger lesion and also from portions of the excised lesion and planted on Sabouraud's honey agar and on other media. After five days at room temperature small white colonies appeared which slowly enlarged becoming brown and later

FIGURE 4

Patient S. K.: Sporotrichic chancre on forefinger.
Secondary nodules on hand.

FIGURE 5

almost black at the borders. The centers became raised and convoluted, the borders flatish with faint radial grooves. Microscopic preparations showed the growth to be made up of delicate branching mycelium about 2 μ in diameter with rounded or pyriform spores and 4 by 6 μ . These were born in clusters at the ends of the short hyphal branches and also along the sides of the hyphae where in some cultures they accumulated in dense masses forming a sleeve around the hyphal thread. Numerous bundles of parallel hyphae (coræmia) were observed and in some cultures typical chlamyds spores. The organism was considered to be *Sporotrichum Schenkii*.

Cutaneous Tests

Scratch tests to stock preparations of *Sporotrichum Schenkii* and with a suspension of spores of cultures isolated from the patient produced no characteristic reactions.

Course

The patient disappeared from observation after

a week and the course of the disease could not be followed.

Sporotrichosis in Animals

There are two cases on record where sporotrichosis has been acquired by handling infected dressings (Foerster). In most instances, however, there is no evidence of contact with a previous case and the curious geographical distribution of the disease suggests that infections usually occur from some other source. In this connection there has been considerable interest in sporotrichosis of animals. In horses the disease takes

FIGURE 6

Rat inoculated with *Sporotrichum Schenkii* showing sporotrichic tumors of the testicles and feet.

the form of a lymphangitis of the legs. The first case was reported by Carrougeau from Madagascar; the second case by Page, Frothingham and Page from Pennsylvania. Meyer¹³ later made a thorough study of this disease and found it prevalent in certain parts of the United States.

In a case reported by Sutton¹⁴ it seemed prob-

FIGURE 7

Cross-section through foot of rat infected with *Sporotrichum Schenkii* showing osteomyelitis of all metatarsal bones.

able that a human infection originated from contact with a diseased horse, but in no other instance has such transmission been proved. Meyer concluded that the equine and human cases both originated from some other source of infection and were not directly related to each other.

Spontaneous sporotrichosis of dogs has been reported by Gougerot in France and by Meyer

FIGURE 8

Section through rat testicle showing sporothrix spores.

in the United States, but no human infections have been due to dogs with sporotrichosis.

Sporotrichosis of rats was observed by Lutz and Splendore¹⁵ at about the same time that they observed their first human case and one of these cases they attributed to the bite of a rat. They also observed the disease in rabbits and in cats.

Saprophytic Sporotricha

Sporotrichum Schenkii has been found in many isolated instances growing saprophytically, but no one frequent habitat has been discovered. After a long search for possible outside sources of infection Gougerot discovered sporotricha indistinguishable from the human strains and highly pathogenic for rats after repeated passage growing saprophytically in the French Alps. Cultures were obtained from the bark of a beech tree, from a horsetail fern and from thorns. Sartory cultivated the organism from the husks of blighted wheat and deBeurmann cultivated it from flies, wasps and ants. Lutz and Splendore found the organism in the mouths and on the fur of healthy rats and Meyer recovered it from the coats of horses, both from healthy animals and from those suffering from the disease.

All of these observations have indicated that

human infection with sporotrichosis is probably acquired either from contamination of a wound, by inhalation or by ingestion of sporotricha growing saprophytically in nature. In most of the instances where sporotrichosis has followed bites there is no evidence that the biting animal or bird was diseased. The most probable explanation is that their mouths had been contaminated with saprophytic sporotricha.

A most interesting observation in this connection was that of Foerster,¹⁶ that in a series of eighteen cases of sporotrichosis which he observed fourteen were employees in a tree nursery and ten had probably acquired the infection by inoculation of thorns of the barberry shrub. A thorn was removed from the initial lesion of two of the cases and in six others thorns had been removed from the fingers preceding development of the disease.

The frequency of the disease in gardeners, florists and other workers handling plants has been noted by other authors and while the evidence all points toward plant material as the commonest source of infection no one source has been established.

Sporotrichosis in Plants

It is of interest in this connection that there is a disease in plants caused by a sporotrichum. Carnations in greenhouses are frequently at-

FIGURE 9

Cultures of *Sporotrichum Schenkii*. From left to right:

1. Culture from infected rat
2. Culture from infected monkey.
3. Culture from infected carnation.
4. Culture from human case.
5. Stock culture from Col. B. K. Ashford.

tacked by bud-rot which occurs in epidemics. This disease has been shown by Wolcott (1905) to be due to *Sporotrichum poae* which is carried from plant to plant by a mite. The same sporotrichum causes a disease of June grass, but this species has never been found in a human case. In experiments reported elsewhere¹⁷ it was found that its inoculation into a monkey and rats produced only transient and uncharacteristic lesions. In this connection it seemed of interest to test the pathogenicity of the human sporotrichum for plants and it was found by one of us that the *Sporotrichum Schenckii* isolated from the case here reported would produce typical bud-rot in carnations. This is of some theoretical interest as it is perhaps the first instance of the transmission

of a human disease to a plant, but it has not greatly aided in the explanation of the origin of human sporotrichosis. The evidence so far collected by numerous workers suggests, however, that the *Sporotrichum Schenckii* will eventually be found to be a parasite on one or more plant forms.

Conclusions

Sporotrichosis which is common in the Mississippi Valley is a rare infection in New York. Two cases are reported proved by culture which originated in this state.

The same disease occurs occasionally in animals, but human cases usually originate from infection by plant material.

SCARLET FEVER CASE-FINDING

By FRANK W. LAIDLAW, M.D., MIDDLETOWN, N. Y.

From the March Number of the Mimeographed Bulletin of the District State Health Officer for Sullivan, Ulster, Orange and Rockland Counties.

Scarlet fever merits the thoughtful consideration of health officers, public health nurses, and all other workers in public health. School medical inspectors and school nurses may also find it worthy of attention.

The names *scarlet rash* and *scarlatina* are confusing to the people. Every physician, health officer, and nurse knows that they are both synonymous with the term "scarlet fever", and yet the names are often used in connection with actual mild cases or for the purpose of allaying the fears of parents in more severe cases. And, incidentally, the idea is conveyed or encouraged that "scarlatina" or "scarlet rash" is not so liable to be conveyed to others as the form dignified as "scarlet fever".

Every one who knows anything about the trans-

mission of scarlet fever knows that mild and atypical cases play a most active part in the spread of the disease in a community, and that their recognition and control is of great importance.

Instead of talking about "A light attack of scarlatina," or a "mild scarlet rash," while we are removing our hat and overcoat, and taking leave of the family, why not say "scarlet fever"? Everyone knows what that means.

The Diagnosis. Don't examine a case with the object of convincing yourself that it is *not* scarlet fever. Unless you can approach the problem with an "open mind" and with the intention of weighing the evidence for and against, you are not a diagnostician any way.

Don't reject the diagnosis of scarlet fever just because the tongue isn't "quite right", and don't

depend on the eruption alone. Consider the *entire evidence*, including possible exposure. The diagnosis is not easy in many instances, and it always deserves careful inquiry and study.

Inefficient methods of control: We frequently devote our attention wholly to the "known case," and stop there, doing, of course, the things tradition has prescribed.

A great deal of attention is placed upon the *location*, the *size* and the *color* of the placard placed on the outside of the house.

The severity of the restrictions placed upon the well members of the family, including the dog, seems to be thought by some to bear a direct ratio to the benefits accruing to the public. We mention the dog deliberately, for we had a perturbed school teacher 'phone us two or three days ago in regard to the activities of a canine belonging to a family in which a scarlet fever case existed.

The public, however, is beginning to expect more sensible, logical, and scientific work along this line.

Finding the source of infection: The time to control an outbreak of scarlet fever is when it begins—and it begins with the first case. Of course, if your previous policy has been one of main force, you won't know when the first case occurs; but we assume that you are getting reports of the cases.

The case should be intelligently and sensibly isolated, of course, *but don't stop there*. The infection was received from a source not more than a week back, and in the majority of instances less than a week. *That source may still be active; and other persons may have been infected at the same time.*

We know all about the alibis, "We ain't been nowheres and nobody ain't been here," and "Nobody has been sick at school," etc. A source existed *or the case would not have occurred*. Sources cannot always be found, but a lot more would be found if attempts were made to locate them. The efficiency of your control will depend upon your success in locating both sources and contacts.

Suppose that B is a regularly reported case of scarlet fever. You may not have other cases from B *after the case is isolated*; but what about those exposed to B before isolation? Unless these "contacts" are kept under observation (and they cannot be quarantined unless they are household contacts), other exposures will result.

But, B contracted the disease from some one, not more than a week before. Inquiry discloses

case A, perhaps a child who returned to school after a few days' absence on account of an alleged "cold." A has exposed others at the same time B was exposed—C, D, E, F, and G; these are probably sick at the same time as B; or perhaps were mild cases and were supposed to have recovered, but who constitute foci from which other cases result.

The following report describes an outbreak in which real scarlet fever work was done: On February 5 a case, G. R., was reported in one of the cities of the district. Instead of merely spiking up a sign, giving the necessary directions regarding the milk bottles, restricting the activities of the well members of the family, and directing the family to take down the sign in thirty days, some real information was secured.

It was found that the onset of case G. R. was February 4, and that there was reason to suspect that the infection was received at school. W. R. was found by the school record to have been absent, sick from January 22 to February 1. W. R. returned to school without the certificate required by Sec. 575 of the Education Law. It was ascertained that W. R. had undoubtedly been ill with scarlet fever.

An investigation of the contacts and their families disclosed 13 additional cases. These were found by active search in most instances. The easiest way, of course, is to wait for the reports to come in, for the energy of the nurse and the wear and tear on the health officer are thereby economized, and the outbreak takes the natural course.

In this particular instance it was found that a previous case, M. K., had developed on January 1, had returned to school on January 18, and had not been checked up. Further search showed that a sister, A. K., had come down with scarlet fever on December 27. Here, then, was a source or chain of infection running back through three generations of cases—a parent case, a grandparent case, and a great-grandparent case.

On further search the health officer found six other cases whose source of infection was the same as that of G. R., the first reported case. The health officer also found that four of these cases were the sources of infection of seven secondary cases.

This is an example of a real investigation, without which scarlet fever control amounts to very little.

A CASE OF ECTOPIC KIDNEY

By A. STRACHSTEIN, M.D., NEW YORK, N. Y.

QUOTING Young,¹ ectopic kidney may be either acquired or congenital.

The acquired form constitutes those cases of nephroptosis in which the descensus is due to increased weight of the organ through hydro-nephrosis or tumor, or faulty attachments. They are characterized by elongated ureters which by their bends or loops show evidence of descent.

The congenital ectopic kidney, on the other hand, is one which has never reached the normal level and is characterized by a ureter which is shorter than normal. The condition is usually unilateral, but may be bilateral.

The frequency of ectopic kidney is shown by Nauman,² who in a collected series of ten thousand one hundred and seventy-seven autopsies found twenty cases of this condition. Of these, twelve cases were on the left side, five on the right side and three bilateral. Of the thirty-eight anomalies of the kidneys studied by Braasch,³ three were ectopic kidneys. The condition is more common among women than in men, for in sixty-six cases collected by Strater,⁴ fifty-three were in women and thirteen in men.

I wish to report the following case that came under my observation: B. R. G. White male, married, age 35, was referred to me in July, 1930, with the following history: One year ago he was treated for prostatitis, although he denies ever having had any Neisserian infection. Three weeks ago he had an attack of pain in his right lumbar region simulating renal colic. This was followed by hematuria. As far as he can remember, this was the only attack of renal colic he ever had.

Prior to his consulting me, he received uroselectan intravenously with the result that while the left kidney showed normal outline and excretion, no trace or outline could be found of the right kidney.

Subsequently, I took a flat x-ray plate with negative findings.

Cystoscopic examination first at my office, and one week later at the Beth Israel Hospital, revealed a normal bladder, normal ureter openings. Both ureters were catheterized without any difficulty and both sides were secreting urine alike; indigocarmine intravenously showed up in strong concentration within three minutes from the left side, and only the faintest trace from the right side after a lapse of fifteen minutes. A retrograde injection for a pyelogram of the right side was now resorted to with the ultimate finding that

the right kidney is located in the median line of the pelvis, and that the upper aspect of the renal pelvis reaches a point directly below the brim of the pelvis. The ureter appears considerably shorter than its mate on the opposite side.

Summary: The salient points are:

- a. The rarity of ectopic kidney.
- b. Retrograde pyelography in many instances brings forward diagnostic facts that remain obscure to intravenous pyelography.

NEW CONDITIONS IN MEDICINE

Physicians are discussing the changes incident to modern times, and their adjustment to new conditions in medical practice. For over five years the Medical Society of the State of New York has had an extremely active standing Committee on Public Relations whose specific object is the promotion of the adjustment of doctors to the new conditions which have arisen in society

generally, as well as in the methods of medical practice.

The new conditions, both medical and social, are the result of a natural evolution in medical science and in the social instincts of the people. Physicians have shared the inspirations and aspirations of teachers, preachers, lawyers, and engineers in wishing to bring all forms of their

professional service to all classes of people. To do this requires extensive adjustments by both the physicians and the people.

Modern Methods—The first basic reason for a readjustment of medical practice is the great progress in the science and art of medicine and in its practice.

Former practice = Healing diseases

New practice = Preventing sickness

Future practice = Promoting health and vigor

Let no one make the mistake of supposing that the healing of diseases is an out-of-date form of medical practice—it is of greater importance and of wider application than ever, and will continue to require the services of the great majority of graduates in medicine.

There could be no practice of preventive medicine a half a century ago, before the germ theory of disease was accepted. Doctors began to practice it a generation ago when the nature of serums and the chemical processes of living cells became known. But preventive medicine cannot come into its full fruition until more extensive scientific discoveries have been made, and the people have become educated to its value and the certainty of its results.

The practice of the promotion of health and vigor will continue to be a long way in the future, for people will conform to their old customs involving over-work, excitement, and indulgence of appetites.

The adjustment of physicians to new conditions of disease prevention consists largely in pushing back the time of recognizing and treating a disease to its earliest stages—cancer while it is only a superficial sore; diphtheria before a membrane is visible; and tuberculosis while it is only a slight "cold." The older physicians generally are adjusting themselves to methods of early diagnosis remarkably well, while the recent graduates have been taught them routinely as if they had always been practiced. The doctor who keeps his own medical knowledge up-to-date is making a praiseworthy adjustment of his practice to changing times.

Evolution in Human Relationships—The second basic reason for the adjustment of methods of practice to changing times is found in the evolution of human relationships.

Former practice = The individual

New practice = The group

Future practice = The community

The practice of medicine is founded on individualism—the contact of an individual doctor with an individual sick person; and this relationship must necessarily continue, for it is the only principle that satisfies human nature. The mother chooses a school because she likes the teacher; the client chooses the lawyer whom he likes; and the churchman worships with the pastor of his choice. To the sick person, the doctor is always

an individual—"my" doctor. It is unthinkable that this relation will ever be abolished; but the doctor will do well to keep it in mind in trying to adjust his methods of practice to the changes of modern times. The most influential doctor is the one who is friendly—whose chief concern in life is to bring that particular patient with whom he is talking back to health and strength.

However, changed conditions of modern times have introduced the element of civic responsibility. No man in New York State can live a self-contained life as he could half a century ago. The physician, most of all, is keenly aware of the effects of community conditions on both the production and the cure of disease. A laboring man, for example, cannot control the sanitary conditions of the factory in which he works, nor can he pay for the nursing care and hospitalization for his sick child. A realization of these needs came first upon groups of citizens who organized hospitals and public health nursing services, and supported them by their voluntary offerings; but the inequality of the burden has led to the evolution of public sentiment and the enactment of laws that the official community—the town, city, or state—shall provide the medical care which the individual citizen cannot provide for himself. If this evolution is carried to its logical conclusion, all medical services will be under government control, and all doctors will work for the State.

Medical Societies—Physicians have realized the tendencies of the times, and have organized themselves into voluntary groups for the purpose of considering medical problems. A group everywhere recognized as necessary and fundamental is the County Medical Society. Although only about seventy per cent of practicing physicians belong to county medical societies, yet it is by far the largest and most representative of all groups of physicians, and is generally accepted as being the "Medical Profession" of a community.

While the courts have held that a corporation cannot practice medicine, yet practically the county society is the natural medical advisor of the county and its component communities. County societies have taken up this activity so recently that many of them are like recent graduates whom no one knows. But a county medical society has the advantage over the young doctor in that it is impersonal, and can offer its services to the officials, and even insist that they shall listen to the advice of the doctors.

The adjustment of physicians to new conditions consists largely in the assumption of the practice of "civic medicine" by county medical societies. If a physician is dissatisfied with the public health actions of a public official, the county medical society offers him a natural medium for correction; or if a doctor wishes to promote a new public health activity, his county

medical society is the authority to represent the medical profession. An individual doctor who wishes to adjust himself to new conditions in the practice of medicine can do so by engaging actively in the work of his county medical society.

Medical Leadership—A doctor is neither a dictator, nor a propagandist. He offers his services to the people; and they accept them for two reasons:

1. They feel the need of his guidance.
2. They have confidence in him.

The ideal condition of medical practice is that the physicians of a community, either individually, or as a county medical society, shall be the source of advice in all matters relating to disease and health. But, as a matter of fact, three groups of medical advisors are in active operation:

1. Physicians and their societies.
2. Boards of health.
3. Lay health organizations.

Public sentiment in health subjects is molded largely by lay health organizations which have

abundant endowments to be used largely for educating the people, and for financing "demonstrations" of clinics and other public health activities. Physicians are not always receptive to administrative ideas dropped upon them by outside "authority." By whatever methods these organizations came into existence, they are here, and physicians are compelled to deal with them. They constitute a "new condition" to which physicians must adjust themselves. It is entirely practical that the county medical societies shall deal with these lay health organizations, and shall offer them medical advice; especially regarding the administrative methods to be adopted. A physician is first of all a healer, and is primarily constructive in his suggestions. If he considers a lay health organization as a patient needing treatment, let him make his diagnosis and therapeutic suggestions in the same spirit and manner that he would give advice to an influential business man. If the doctor approves the objects and methods of the lay health organization, he will best adjust himself to new conditions by friendly cooperation.

LOOKING BACKWARD

This Journal Twenty-Five Years Ago

Sending tuberculosis cases to the country:—The dangers of sending cases of tuberculosis to the country to enjoy the "fresh air" without supervision, are set forth in the following editorial in this Journal of May, 1907:

"In an article on the dangers of sending consumptives to the country, published in *Charities*, March 16, 1907, the tuberculosis nurse of the Instructive Visiting Association, of Baltimore, reports upon fifty-five cases sent to the country during the last eighteen months. Of these, only two were really benefited; thirty-two returned to the city worse than when they went away; and eight died in the country. It is further stated that it is safe to assume that fifty-five centres of infection were created (as the cases were sent to farm houses), and it is doubtful if any of these infected houses was afterwards cleaned or dis-

infected with a view to making them harmless. In one instance, three members of the household contracted tuberculosis after the death of the primary patient. Another case was that of a woman who, while under surveillance of the tuberculosis nurse, used a sputum cup and slept alone. She was sent to the country, where she quickly relaxed her discipline, slept with her little child, and returned to the city in a dying condition, the child also having contracted the disease.

"It is very properly contended that if a patient cannot be watched over by a sanitarium or competent authority, he should remain at home. The facts seem to show that rarely is a consumptive capable of sufficient moral courage to undertake the rigorous open-air treatment alone. Ordering the patient to the country often simply shifts the responsibility and spreads the disease."

MEDICAL PROGRESS

Treatment of Some of the Commoner Lid Conditions — In the treatment of *blepharitis* Oscar Wilkinson recommends that attention should first be directed to diet—removal of excessive carbohydrates—and to personal and local hygiene. In the squamous type the margins of the lids should be cleansed with 5 per cent solution of sodium bicarbonate, and after thorough massage, the borders of the lids should be swabbed with 1 or 2 per cent yellow oxide of mercury ointment. In ulcerative *blepharitis* citrine ointment and vaseline, equal parts, massaged into the lid borders hot once a day is most effective. Recurring pustules of the lid should be carefully touched with 50 per cent solution of carbolic acid or with Lugol's solution. The treatment of *chalazion* is both local and surgical. The lid edges should be massaged and 1 per cent yellow oxide of mercury applied, or cold boric acid. If, in removing the tumor surgically, the thickened membrane is not excised, the bottom of the cavity should be dried and trichloroacetic acid applied, and thoroughly neutralized with bicarbonate of soda solution. *Ectropion* and *entropion* may be spastic, senile, or cicatricial. In the spastic type the associated eye disease should be treated. In obstinate non-inflammatory cases relief may be had by the injection of alcohol or the use of the galvano cautery point. The latter measure is also useful in the senile type of this condition. The treatment of the cicatricial types is surgical, the procedure being adapted to the individual case. For entropion of the upper lid Wilkinson prefers the Webster operation. *Eczema* of the lids demands the same general treatment as *eczema* in other regions of the body. The local treatment consists in the application of mild astringents, such as mild boric acid, glycerin, and camphor lotion. Calamine wash is one of the most effective remedies. Where itching is annoying zinc oxide ointment to which is added 5 grains of carbolic acid to the ounce will often give relief. In chronic cases ammoniated mercuric ointment is useful. In intractable cases the *trays* carefully used are often beneficial. *Nevi* and *warts* may be readily removed by fulguration. Excision followed by cauterization with trichloroacetic acid is effective. *Sties*, if seen early, may sometimes be aborted by the application of citrine ointment and vaseline applied with a heated probe. Early incision, however, is desirable. The best anaesthesia can be obtained by painting the proposed line of incision with carbolic acid on the tip of a fine applicator covered with a mere strand of cotton. For debilitated subjects with recurrent sties iron and arsenic are indicated together with

autogenous vaccines. *Trichiasis* may be treated by electrolysis or by surgery. Where only a few hairs are present electrolysis is the method of choice. For *xanthelasma* some process of removal is necessary. Trichloroacetic acid and fulguration have been recommended, but excision is the method of choice.—*Southern Medical Journal*, March, 1932, xxv, 3.

Observations on a Case of Agranulocytosis.

—A case that appears somewhat out of the common is reported by Theodore Dumitresco in the *Archives des maladies du coeur* of January, 1932, in which there was total absence of granulocytes in the blood, and in which the characteristic vesico-bullous elements were distributed not only in the throat but over nearly the entire surface of the body. The case was further characterized by the presence of a bacillus morphologically resembling *B. perfringens* in the histologic sections, in the organs and in the smears of the bone marrow. An exanthem resembling measles was observed scattered over almost the entire body, which developed in places into bullous and ulcerated vesicles. The patient a man of 41, had been ill only 3 days when admitted, and the case terminated fatally 32 hours later. Microscopic examination of 6 smears of the bone-marrow revealed only 65 white cells, most of which were mononuclears, and the rest myeloblasts. There were no polynuclears and no myelocytes. Nucleated red cells were numerous. Large bacilli resembling the perfringens were scattered irregularly through the bone marrow. This picture demonstrates that agranulocytosis is due to insufficient formation of granular elements, and not to their excessive destruction in the blood. Examination of the bone marrow is thus shown to be of great interest in determining the etiology, since there is a tendency among diagnosticians to trust the results of blood examination, whereas it is the myelopathy that should concern them. In the majority of cases the patient succumbs because the bone-marrow is no longer capable of producing the granular elements required to combat the infection. The etiology of the agranulocytosis itself is still obscure. In the case outlined, the distribution of the bacilli throughout the organs and bone-marrow suggested an anaerobic septicemia, perhaps of dental origin. There is, however, the possibility that this agranulocytosis was provoked by some antispecific treatment unknown to the author and of more or less recent date, the patient having been in too clouded a mental condition to be questioned about this. Again the fact that the patient's work had exposed him to ben-

zene vapors may have played a part in the causation. The total absence of granulocytes both in the blood during life and in the bone-marrow smears is stressed as well as the possible correlation between this finding and the very rapid evolution of the agranulocyte syndrome in this case.

Some Clinical Aspects of Coronary Disease.

—Thomas F. Cotton, writing in the *British Medical Journal*, February 27, 1932, i, 3712, emphasizes the importance of distinguishing the symptoms of angina pectoris from the syndrome of coronary obstruction, since upon this differentiation depends the treatment, and not infrequently the life of the patient. In relation to angina he stresses the importance of vasoconstriction, not only local and involving the coronary arteries, but also as a widespread phenomenon, producing elevation of blood pressure during the attack in certain patients. He brings out the fact that the contributory toxic causes of secondary angina, such as gall-bladder infection, goiter, or other focus of sepsis may influence the course of true angina pectoris. He comments on the variable rôle of the higher centers in the production of angina pectoris; in some patients there exists almost a mathematical relationship between the degree of effort and the production of pain, emotional factors being insignificant or absent; others are predominantly influenced by anxiety, anger, and excitement. It is in the latter group, and in patients in whom widespread vasoconstrictor influences are manifest, that aspects of angina pectoris appear which have hitherto been largely neglected. This group in which there is no clinical evidence of structural disease constitutes perhaps 25 per cent of all cases with symptoms resembling true angina.

The coronary thrombosis syndrome is sudden in onset, the pain is anginal in character and distribution, lasts for hours or days, and, contrary to the pain of angina, usually occurs when the patient is at rest. It is often accompanied by respiratory distress and vomiting. Signs of embolism may be expected. Of those who recover, probably 50 per cent of all cases, some may lose their symptoms within a few days; others develop signs of congestive failure or of angina pectoris, and may have exhaustion symptoms and a low blood pressure for weeks or months. The average anginal patient is likely to die within five years from the onset of symptoms, while with coronary occlusion the period of survival is not more than two or three years. The treatment of angina pectoris is largely ambulatory, while in coronary occlusion rest in bed for a month is essential, and preferably for six weeks. Good nursing and sedatives are more important than circulatory stimulants. If there are signs of congestive failure and auricular fibrillation or flutter, digitalis is indicated. Adrenaline should be reserved for patients with signs of heart block, and quinidine

should be restricted to rare cases of tachycardia of unusual duration.

Hypophysis and Metabolism.—In addition to its morphogenetic, sexual, and endocrine rôle, says B. A. Houssay, writing in the *Revue française d'endocrinologie*, of December, 1931, the hypophysis has important metabolic functions. Its insufficiency produces a moderate and inconstant lowering of the basal metabolism, while its excessive functioning frequently has the opposite effect. It stimulates endogenous protein metabolism and fixation of proteins in the tissues; hence its rôle in growth, acromegaly and gigantism. Exogenous protein metabolism is, however, little affected. In hypophyseal insufficiency, destruction of proteins in the tissues is diminished; this is especially striking under fasting conditions and in induced pancreatic and phlorizin diabetes; bacterial action is decreased; thus we may understand the extraordinary survival of hypophyseoprivic dogs in which the pancreas has been removed. Elimination of creatinin is less in hypophyseoprivic animals, whether fasting or otherwise. The specific dynamic action is frequently diminished in hypopituitarism in human beings and in rats (omnivorous species), but is generally normal in dogs, which are carnivorous. The blood sugar is normal in well nourished hypophyseoprivic animals, but is lower during fasting than in the controls. Hypoglycemic crises are rather frequent, and are fatal if not treated promptly by sugar. These animals do not tolerate well those substances (insulin, phlorizin) that produce hypoglycemia. Induced hyperglycemia and glycosuria are less intense, and are greatly influenced by fasting. Implantation of hypophysis (in the toad), on the contrary, aggravates these conditions. It is quite probable that acromegalic diabetes is due essentially to hyperpituitarism. All these modifications are explained by assuming that hypophyseoprivic animals form less sugar at the expense of endogenous proteins. At the same time, in diabetic conditions, they consume more sugar than the controls (there being partial retention of the sugar administered, and often increase of the respiratory quotient). Disturbances are due essentially to a lessened formation of sugar, and not to a greater consumption. The hypophysis would tend to stimulate the consumption of endogenous protein and its transformation into sugar.

Medical Applications of Anti-Colibacillary Serum.—H. Vincent directs attention to the great frequency and importance of *B. coli*. He reminds us that this microorganism may implant itself in any organ or tissue of the body. It may be the cause of grave septicemias, especially in children. It is not only dangerous by reason of its infective properties, but because of the toxin it produces. Contrary to the general opinion,

Vincent holds that there is only one variety of *B. coli*. This species produces two types of toxin (1) A neurotropic thermolabile exotoxin, which causes widespread damage to the motor and sensory cells of the spinal cord, and also attacks the encephalon, the peripheral nerves, and the sympathetic and vagus systems (2) an enterotropic thermolabile endotoxin, the ill-effects of which are exerted on the intestine, the mucosa, the intestinal glands, and Peyer's patches, as well as upon the hepatobiliary apparatus. Close observation reveals symptoms more particularly due to one or the other of these toxins or to their association. Experimentally, it is possible with these toxins to set up choleraform symptoms in rabbits (endotoxin), or even nervous symptoms, such as ascending paralysis, monoplegia, fantastic behavior. Vincent has prepared a therapeutic anti-colibacillary serum which in numerous cases of grave colibacillosis yielded rapid and conclusive results. Its use is indicated in colibacillary septicemia. As this condition closely resembles typhoid and paratyphoid fevers, the diagnosis must be based on the blood culture. With the injection of from 20 to 40 c.c. of the serum a day the temperature usually returns to normal on the second or third day, and other symptoms subside. Suppurative pyelonephritis and cholecystitis caused by *B. coli* likewise yield to this treatment. It is quite possible that some of the cases described as Landry's ascending paralysis are due to intoxication produced by the neurotropic exotoxin of *B. coli*. As soon as symptoms of this condition make their appearance, the anti-colibacillary serum should be injected, as it will neutralize the toxins and bring about recovery. Typical illustrative cases of this kind are cited. In cases of double intoxication with gastrointestinal disorders associated with excessive mental irritability, periods of depression, symptoms of neurasthenia or even of psychasthenia the serum has brought about recovery. The rapid disappearance of this complex group of symptoms demonstrates that the etiology and pathogeny of chronic enterocolitis must be regarded from a new angle. It should be considered as a toxic-infectious disease, more toxic than infectious. Vincent also cites examples of dementia praecox, following colibacillary septicemia, in which six injections of 40 c.c. each of the serum effected a cure. — *American Journal of the Medical Sciences*, March, 1932, LXXXIII, 3.

Treatment of Pneumococcus Peritonitis — According to Nové-Jossierand, it must be maintained in a general way that patients suffering with pneumococcus peritonitis are likely to be in a state of pneumococemia, that is to say, that they have to combat a grave general infection which may have involved other organs without giving any definite signs of the fact in the early stages of the disease. The peritonitis is diffuse at the outset. All that is seen at first is a marked

tumefaction of the mesenteric ganglions, and a peculiar condition of the small intestine, which is vascularized and gives back, upon palpation, a viscid sensation that is quite unique. After 24 hours there is a mucous exudate of no great amount, diffused among the loops, and it is not until the second day that a serous or purulent effusion of any importance is observed. The question arises whether this peritonitis should be operated on emergently like other grave cases of peritonitis. Such operation is useless during the early hours, owing to the slightness of the exudate and the impossibility of its evacuation. Moreover, the source of the infection cannot be correctly determined, in view of its diffuse and often septicemic nature. But in actual practice, the difficulty of its differential diagnosis from appendicitis does not permit the laying down of abstention from operation as a formal rule. Every effort should be made to reach a diagnosis, and if there is a reasonable amount of certainty, one should play a waiting game, keeping the patient under strict observation meanwhile, since in diffuse forms of peritonitis the indication for operation may exist from the second day on. If, however, the diagnosis remains doubtful, it is safer to operate, but the procedure should be of the simplest and as short as possible, in order to reduce the dangers to a minimum. Local anesthesia is the method of choice. The peritoneum should be opened, for the inspection of the appendix, and if this is not incriminated, there should be no intraperitoneal maneuvering; a drain should be placed in Douglas' cul-de-sac, and the peritoneum closed again. The decision is easier at the end of 24 to 48 hours, when either the patient will be in a state of general peritonitis with nothing to lose through operation, or there will be definite signs pointing toward resolution or an encysted peritonitis, in which case the operation may be deferred until the third week. — *Journal de médecine de Lyon*, February 20, 1932.

Intravenous Glucose Infusion by the Drip Method in the Treatment of Severe Puerperal Infection — Kirstein, writing in the *Deutsche medizinische Wochenschrift* of January 8, 1932, says that in 1925 he announced to the Gynecological Congress in Vienna his method of treating severe puerperal infections with slow intravenous infusion of 10 per cent glucose solution given by the drip method. He has since used the method in coli-peritonitis, and has never lost a case. Very recently a grave case of streptococcus peritonitis was brought to a successful outcome by its use. Kirstein attributes this cure to the simultaneous administration of enormous amounts of adrenalin, of which the patient received 93 c.c. of a 1:1000 solution in 72 hours, partly in the infusion and partly by subcutaneous injection. Twice during this time the woman appeared to be in extremis, but no let up of the treatment was

allowed, 1 c.c. being given every 15 minutes. After a few hours of the drip-infusion it is customary to observe (though there are exceptions) a very steep drop of the temperature and pulse curves. This must not in the least be regarded as a collapse phenomenon, though one at first has the impression of its being such. While one must not, of course, rely solely on the infusions in severe puerperal infection, it is worthy of mention that 3 desperate cases in which large doses of anti-streptococcus serum had proved useless responded to glucose infusion. Instead of antitoxin Kirstein advises an iodine preparation. The intravenous drip-infusions of 10 per cent glucose should be begun as early as possible, and should be accompanied by large doses of alcohol. It is recommended that surgeons make use of slow glucose infusions in cases of severe infection in all fields. Apart from its effect in diseases of bacterial origin, the infusion is a useful supportive measure, especially in connection with postoperative treatment.

The Clinical Significance of Precordial Tenderness and Its Relationship to Pain.—Because of the lack of knowledge concerning the common finding of precordial and substernal tenderness Frederick Kellogg and Paul D. White have made a clinical study of the subject with particular reference to the presence or absence of heart disease. From 3,770 consultation cases they collected 328 cases of definite precordial tenderness, an incidence of 8.7 per cent. The sign was more than three times as common in women as in men. It was found more often after the age of forty than before. There was no relation between the degree of tenderness and the type of pain complained of. Fifty-three patients who showed precordial tenderness complained of no pain. In the tenderness series effort syndrome was common and the combination of organic disease with effort syndrome decidedly common. Congestive failure was twice as common, relatively, in males with tenderness as in females. Nervousness was noted in 40 per cent of all cases. There was a tendency for the knee jerks to be hyperactive in the tenderness series, presumably because of a hypersensitive nervous system. The general condition of these patients is apt to improve, while the tenderness is likely to persist for years. The results in this series differ from those of Kahn who found tenderness present in 90 per cent of all patients with angina pectoris and in no patients with normal hearts, whereas in this series it was present in only 12 per cent of cases of angina pectoris and in 2.3 to 15 per cent of the patients with normal hearts. The authors conclude that precordial tenderness may occur in an individual with a hypersensitive nervous system, whether or not there is serious heart disease. In the present series it was more often found when there was a combination of heart disease and

nervousness than with either condition alone. The factor of nervous irritability and fatigue is certainly of greater importance in the production of the sign than is organic cardiovascular disease, for in cases of very severe, acute and fatal coronary thrombosis there may be no tenderness whatsoever.—*New England Journal of Medicine*, March 31, 1932, ccvi, 13.

Ventricular Fibrillation: An Overlooked Cause of Death in Diphtheria.—There appears to be no doubt, say J. Chaliel and Roger Fromont, in the *Archives des maladies du cœur* of February, 1932, that diphtheria sometimes produces troubles of rhythm which we know today under the name of prefibrillatory ventricular disturbances, and which embrace the entire gamut from double rhythm, ventricular extrasystoles of a polymorphous nature, to salvos of terminal ventricular tachycardia and fatal ventricular fibrillation. These are the disturbances that constitute a number of complex diphtheritic arrhythmias. It is a striking fact that side by side with those diphtheria cases which present evidence of heart block through auriculo-ventricular dissociation, during the days or hours just preceding death, there are other very different ones, characterized by marked tachy-arrhythmia, which appears to be due to the interception of a basic rhythm, that is already rapid, by extrasystoles, sometimes single and sometimes coupled or grouped in short salvos. The P wave has disappeared, and there is a deformation of the ventricular complexes, the form of which is also variable from one moment to another, and the direction now negative, now positive. It is difficult to determine with precision the frequency of this death from ventricular fibrillation. Death from heart failure in diphtheria is relatively rare, not being over 10 per cent. But this ventricular fibrillation can certainly be held responsible for a certain number of sudden deaths during the course of diphtheria. A case of Strecher's is on record in which a common sinus tachycardia on the eighth day of diphtheria had become 4 hours later a rhythm chopped with polymorphous ventricular extrasystoles, followed by death one hour after the last tracing. It is thus seen that a diphtheritic heart may pass in 5 hours from a normal rhythm to ventricular fibrillation, and that death may under these circumstances be not only sudden but absolutely unforeseen. There are, nevertheless, in diphtheria, ventricular extrasystoles in salvos that show a benign evolution; in such cases the toxic or inflammatory disturbances that underlie the phenomenon, instead of evolving fatally toward death, regress rapidly under the influence of energetic treatment. It thus appears that the usual elements of prognosis in this disturbance hold good during the course of diphtheria.

LEGAL

A REVIEW OF SOME INTERESTING X-RAY BURN CASES

By LORENZ J. BROSNAN, ESQ.
Counsel Medical Society of the State of New York

In recent years a number of cases have been instituted against doctors based upon burns received by a patient from the use of the x-ray, either for treatment or for diagnosis. A case recently decided by one of the Federal courts may be of interest as illustrative of how the courts deal with such cases.

A woman had consulted a doctor H, the defendant, with respect to an ailment of the glands of her neck and throat. Dr. H was a well trained specialist in skin diseases, specializing particularly with the use of x-ray in relation to skin diseases. He had been practicing medicine for about twenty years and specializing in x-ray work for about twelve. The condition of the woman was diagnosed as a pronounced case of tubercular adenitis of the lymph nodes, a tubercular condition of the glands on both sides of the neck running down to the middle of the clavicle and in the armpits. There seems to have been no question but that her condition was serious, for one doctor subsequently testified that if such a condition remained without treatment the usual result would be either a breakdown of the glands involved, and a chronic discharge through open sinuses, or rupture into the blood vessels, with consequent general spreading of the tubercular condition, and resultant death. Dr. H considered the proper treatment to be the administration of the x-ray, for a surgical operation to remove the glands would have necessitated an incision extending from a point near the ear down to the middle of the clavicle, and as the court described it, "with the complete cleaning out of everything in the neck on both sides, and in addition to that would have required operation in both armpits, and probably the operation would have extended from either the armpit up to the clavicle, or from the clavicle down, or both, so as to get out the intervening glands." Dr. H undertook the treatment of the case with x-ray, and such treatment extended over a period of about ten months, one side of the neck being exposed every other week. At the end of that time, the condition of tubercular adenitis was completely cured but some time after the administration of the last x-ray treatment, a condition of x-ray burn appeared on the patient's neck.

Some time thereafter, a suit was brought claiming damages for negligence in causing the burn asserting in particular that the doctor was negligent in too frequently exposing the plaintiff to

his x-ray apparatus and in subjecting her to exposures of excessive duration.

When the case came up for trial the plaintiff called a physician as an expert on her behalf, who qualified as an x-ray specialist. A hypothetical question was put to him embodying the plaintiff's theory of the treatment administered to her by the doctor and the opinion was expressed that the treatment so accorded her was not proper practice. He asserted that if exposures to x-ray treatment were continued by the defendant after the appearance of a "reddish glow characterized as a recent sunburn," in his opinion the doctor was not exercising ordinary skill and ability. Upon cross examination, however, the plaintiff's expert admitted that x-ray treatment was proper care for tubercular glands and said in addition:

"The factors employed in the giving of x-ray treatment depend entirely upon what the treatment is given for. The treatment and dosage and distance and duration of treatment in the case of tubercular adenitis would be different from many other troubles. I know of x-ray treatments being given when there has been an erythema.

That is largely a question of judgment on the part of the person giving the treatment. Whether they would give a subsequent treatment or not would depend upon the man's judgment, of course, upon the exercise of judgment upon his part, regardless of technique, the erythema following a dose of x-ray probably is the one more or less constant factor that controls the man's subsequent dosage, and that of course does depend on his judgment, and that is the only way it can be determined. It is a matter of judgment in the light of the skill possessed by the man who is giving the treatment. I do not know anything about the treatment in this case."

On behalf of Dr. H, the defendant, several physicians, who qualified as experts, testified that telangiectasis may follow x-ray treatment where the highest degree of skill and care has been exercised, and further that there is no known method of determining in advance whether a reaction resulting in a burn will follow the administration of x-ray. Such experts also asserted that the operator is bound to exercise his best judgment in view of the conditions that he is treating and in view of all the conditions he alone using his best judgment, must decide, erythema or not being present, whether he should continue his treatments.

The defendant himself testified that he had used his best judgment in the matter and stated, among other things:

"As to whether I could have afforded her greater protection by extending the length of time between exposure of the same area, that again is entirely and absolutely a question of individual judgment. It was a question based largely upon the condition of plaintiff, and I felt that the chances for the grave yard were very, very good, if the treatment were not pushed and the intervals were not made short."

A verdict was rendered in favor of the plaintiff by the jury for the sum of \$15,000. An appeal was taken. The Appellate Court, however, reversed the judgment of the trial court on the ground that it found no evidence in the record to justify a conclusion that the defendant was negligent. It stated in its opinion:

"It is conceded that Dr. H. possessed the requisite degree of skill and ability; that *x-ray* treatment was the recognized treatment for tubercular glands; it clearly appears that the length of time between exposures of the same area depends upon existing conditions and the judgment of the operator; that telangiectasis may occur even if the highest skill is exercised in the treatment. As already observed, there is no evidence upon which it reasonably may be found that Dr. H. did not exercise his best judgment and ability in treating the plaintiff, or that in his treatment of the plaintiff he failed to exercise the care and skill ordinarily possessed and exercised by others in the profession."

It seems clear that the trial court and the plaintiff in said case proceeded principally on the theory that the burn itself was evidence of negligence, and could not otherwise be explained. The attempt was to establish liability through the so-called doctrine of *res ipsa loquitur*, which is explained by a leading legal encyclopedia as follows:

"Where the thing which caused the injury complained of is shown to be under the management of defendant or his servants, and the accident is such as in the ordinary course of things does not happen if those who have its management or control use proper care, it affords reasonable evidence in the absence of explanation by defendant, that the accident rose from want of care."

If such a doctrine were applicable to cases of *x-ray* burn a doctor would practically be held to insure the result in such a case. However, the courts have taken a more sensible attitude. In another similar case it was recently said:

"The standard of care, skill and diligence required of an *x-ray* operator is not fixed by the *ipse dixit* of an expert, but by the care, skill and diligence ordinarily possessed and exercised by

others in the same line of practice and work in similar localities." . . .

"Plaintiff's case rested upon the charge of negligence on the part of the defendant in administering an excessive dosage, but depended in the main upon his own testimony. The doctrine of *res ipsa loquitur* is not recognized in this State and therefore proof of the burn was no proof of defendant's negligence. Plaintiff had the burden of showing that he suffered an *x-ray* burn, occasioned by an overdosage or exposure of his foot, and that such happened because defendant failed to exercise the reasonable and ordinary care, skill and diligence possessed by others in the same line or practice and work in similar localities.

The evidence discloses that *x-ray* burns do occasionally occur in the ordinary course of exposure and in spite of the highest diligence and skill to prevent them; the risk being that persons of a certain type and temperament are susceptible to a burn while persons of a different type and temperament, under the same circumstances will not suffer a burn. It also appears that this idiosyncrasy cannot be determined before or during the time of exposure, but is manifested only by subsequent developments. Plaintiff assumed the risk of a burn from a proper exposure to the *x-ray* and defendant incurred the liability to respond in damages if the burn was occasioned by his negligence."

Likewise, in a recent case where a plaintiff who had received *x-ray* treatments for eczema with a burn resulting therefrom, was prosecuting a malpractice action, another court said:

"One who is an *x-ray* expert is not an insurer and does not bind himself to make a correct diagnosis and effect a cure or to respond in damages. He is only bound to possess reasonable skill and to use ordinary care, and if he makes a mistake in his conclusion, he is excused from liability if, possessing reasonable skill, he has used ordinary care. He is not liable for an honest mistake in judgment. . . . A failure to cure is not enough, in itself, to raise an inference of negligence in the diagnosis and in the treatment adopted."

The court further stated:

"Only those are qualified to testify as to whether there was negligence in the method of treatment who possess the skill required to administer such treatment, who are themselves experts in such treatment, and to them the jury must listen. The uncontradicted evidence in this case shows that appellant had the necessary knowledge and skill to treat the appellee for eczema with an *x-ray* machine; that the treatment of that disease by *x-ray* is a proper treatment and recognized by all authorities; that appellee was suffering with that disease; that appellant treated, but once therefor with an *x-ray* machine, using a standard machine. All of the expert witnesses who testified as to the method

of treatment used by appellant, as given by himself, testified that such method was proper for the treatment of eczema."

A review of these and other cases on the same subject demonstrates that in nearly every instance where a court has submitted an x-ray burn case to the jury, the lay jury has resolved the is-

sue adversely to the physician. In other words, the lay mind cannot contemplate that under certain circumstances an x-ray burn may occur even with the best of care and skill. Fortunately, the injustice of some of the verdicts in these cases has been rectified by the appellate courts to which the cases have been carried.

ALLEGED NEGLIGENT TREATMENT OF HEMORRHOIDS

A doctor who specializes in the treatment of rectal diseases was consulted by a young man with respect to rectal bleeding. The doctor found a number of hemorrhoids, sore and bleeding, and advised an operation. Under a spinal anesthesia the hemorrhoids were lifted, tied off, and excess tissue removed. Vaseline dressings were applied, held in place by adhesive strips. The patient remained in the hospital under the doctor's care for about a week, and thereafter on two occasions called at the doctor's office for dressings. About three weeks after the operation the doctor received word that the man had entered a hospital because the hemorrhoids had again begun to bleed. The doctor immediately went to the hospital, took the man to the operating room, tied off the bleeding areas, and packed the rectum. As the hospital was a considerable distance from the doctor's office he left the patient under the care of a member of the staff of that hospital, and gave full instructions as to the further care of the case. He left instructions that a blood transfusion be given the man, and was subsequently informed that the transfusion was given, and that the patient improved rapidly. The doctor never saw the patient again, and heard nothing further

of the matter until several weeks later a letter was received by him threatening suit based on malpractice in performing the operation on the plaintiff.

The patient instituted such an action, claiming in his complaint that the operation performed by the defendant doctor was so negligent that as a result he ever after was caused frequent bleeding to such an extent as to make him anemic. Plaintiff in his complaint further attempted to charge the defendant with responsibility for his being unable to attend to his vocation for many months and the expense of medical treatment undergone subsequent to the first operation performed by the defendant.

Plaintiff started said case in a county other than the county in which the defendant resided and treated the plaintiff. A motion was made to change the place of trial to the county where the doctor resided on the ground of convenience of witnesses. Said motion was adjourned from time to time at the request of the plaintiff's attorney, and before the same was ever argued the plaintiff and his attorney consented to discontinue the action, terminating the matter in favor of the doctor without trial.

LOSS OF TEETH DURING TONSILLECTOMY

A young man made arrangements with the defendant, a doctor who specialized in general surgery, to have his tonsils removed. The patient entered a hospital and was prepared for the operation. An assisting physician undertook to anesthetize the patient by ether. It was found that double the normal amount of ether was required to render him unconscious. When examination showed that he was sleeping and relaxed, a gag was adjusted in his mouth and his throat was examined. Just as the surgeon was about to remove the left tonsil the patient suddenly came partly out of the anaesthetic, snapping his jaws shut on the mouth gag which caused the two central upper incisor teeth to be bent forward and loosened from their sockets so that they were in a horizontal position. The gag flew out of the patient's mouth and before pro-

ceeding further with the operation the surgeon removed the two teeth. The ether anaesthetic was then supplemented by a hypodermic of morphine, and the surgeon proceeded with the tonsillectomy. So far as the actual removal of the tonsils were concerned the operation and the recovery therefrom were normal.

The patient some time later brought an action charging that the defendant was responsible in damages to him for negligently breaking off two of his front teeth during the operation of tonsillectomy.

The case, however, was never noticed for trial and after a considerable period of time had elapsed, a motion was made on the part of the defendant to dismiss the case for failure to prosecute. Said motion was granted and the case was thus terminated in favor of the defendant doctor.

NEWS NOTES

REDUCED RAILROAD FARE TO BUFFALO

All members of the Medical Society of the State of New York purchasing tickets to Buffalo on account of the State meeting which begins on May 23rd, should be sure to secure a certificate

from the ticket agent at the time the ticket is purchased, as fare and one-half on the certificate plan will be authorized by the New York Central Railroad.

ANNIVERSARY MEETING AND BANQUET

The law of April 10, 1813, incorporating the Medical Society of the State of New York required the society to fix the time and place of the annual meeting, which was called the *anniversary* meeting.

The Anniversary Meeting this year will be held on the evening of Tuesday, May 24, in the Hotel

Statler, Buffalo, immediately following the banquet. The principal speaker will be Dr. George David Stewart, Professor of Surgery in the University and Bellevue Hospital Medical College, who has a rare faculty of combining science and literature with entertainment worthy of an audience of high class physicians.

COMMITTEE ON PUBLIC RELATIONS

The regular monthly meeting of the Public Relations Committee was held in the Hotel Syracuse, Syracuse, on Thursday, April 21, 1932. The following were present: Drs. Sadlier, Fisher, Hambrook, Mitchell and Lawrence; Dr. W. D. Johnson, President of the State Society; Dr. T. P. Farmer, Chairman Public Health and Medical Education; and Dr. F. H. Flaherty, of Syracuse.

The Committee considered a report made to the Executive Committee of the State Society on February 1, 1932, by Dr. J. N. Vander Veer who had been appointed Liaison Officer between the Medical Society of the State of New York and the New York State Department of Health in regard to the public health aspects of venereal disease control. The Committee also considered the plan promoted by the State Charities Aid Association, the principal features of which are as follows:

1. The establishment of clinics in rural communities.
2. Securing State aid for the clinics.
3. Enlisting the aid of the county committees on tuberculosis and public health.
4. Educating the public.

The attitude of Dr. Vander Veer is indicated in his article, "The County Medical Society in Venereal Disease Control," printed in this Journal June 1, 1931, page 712.

The Committee adopted the following resolution:

"WHEREAS, we are informed that the State Charities Aid Association proposes to develop a program for the dissemination of information regarding venereal diseases and their treatment;

"BE IT RESOLVED, that it is the sense of the Public Relations Committee of the Medical Society of the State of New York that we favor the educational program as outlined to us, when carried out in conjunction with the State and Local Health Departments; but we are opposed to the State Charities Aid Association or any lay organization engaging in the treatment of venereal diseases or superintendence of such treatment as outlined in their report. We consider the treatment of venereal diseases to be a responsibility only of the State and Local Health Departments in conjunction with the private physicians, and we are further opposed to any program which would induce other than indigents to seek treatment at public clinics, for two reasons: first, it is intruding upon the prerogative of every practitioner who wishes to treat said diseases; and second, it would incur unnecessary expense upon the State and community, as well as pauperize those members of society who accept while being able to pay for their treatment."

A meeting of the Committee was held with the chairmen of the Public Relations Committees of the section in the vicinity of Syracuse. The following representatives were present:

G. S. Lape	Broome County
C. F. McCarthy	Cayuga "
J. D. Olin	Jefferson "
D. H. Porter	Lewis "
Charles D. Post	Onondaga "
W. B. Clapper	Ontario "
M. J. Stearns	St. Lawrence "
F. W. Lester	Seneca "
G. S. Carpenter	Tioga "
Ralph Sheldon	Wayne "
E. C. Foster	Yates "

Representatives from the following counties were excused because of illness or other reason: Chemung, Chenango, Herkimer, Oneida, and Tompkins.

Doctor Farmer referred to the injunction given by the House of Delegates at its special meeting to the public health committee to assist county societies who may desire such assistance in informing themselves upon the advantages of the county health unit form of public health work.

Doctor Mitchell emphasized the necessity of regular meetings of the county committees.

Doctor Hambrook dwelt upon the desirability of having the personnel of county committees remain permanent. The work of a public relations committee is not readily initiated, and if the personnel is changed each year, a committee cannot be expected to accomplish very much.

Doctor Post, chairman of the committee of the Onondaga County Society, reviewed some instances where the county society might have profited by the assistance of an active public relations committee,—for instance, at the time when the Milbank Fund was developing its public health demonstration in Syracuse. The county society has formed a working relationship with the local tuberculosis association, but this could have been done much more effectively had it been done through the public relations committee. The county society and the tuberculosis association have an active joint committee that has conducted a radio program. The county society also, as such, has been instrumental in assisting in having an inefficient welfare officer removed.

Dr. G. S. Carpenter, from Tioga County, presented the following report of his committee's activities:

"The society had four members on the Tioga County Public Health Committee, which had charge of the nursing service throughout the county. Much publicity was given in this way to the general public through the press.

"Members of the public relations committee were also on the committee of the local charities aid, and with them organized and financed a clinic in tuberculosis held at the Tioga County General Hospital, quarterly. This clinic is being continued in 1932.

"Due to lack of appropriation by the Tioga

County Board of Supervisors, the public nursing service was discontinued January 1, 1932. However, this work is being carried on, in a measure, through the cooperation of the local State Charities Aid Committee, on which committee is serving several members of the Tioga County Medical Society who are assisting materially in directing the work of that organization."

A public health exhibit was sponsored at the County Fair in the fall of 1931, under the joint auspices of the Tioga County Medical Society, Tioga County Public Health Committee, the Tioga County General Hospital, and the State Charities Aid. At this Fair a tent was kept open with a nurse in charge, with whom mothers could leave their babies, and food was provided for the children. Each afternoon a lecture on some public health topic was given. The subjects included tuberculosis, cancer, and annual health examination.

Doctor Sheldon, of Wayne County, reported that his committee had worked hard to have the health work of the county organized under the unit plan; that the County Society had passed a resolution, but the board of supervisors had turned them down. His committee is now endeavoring to prevent the supervisors from abolishing their public health nurse program. The committee is planning to ask the board of supervisors for the appointment of a county board of health. Since the last election they have had a new board of supervisors and his Public Relations Committee has been enlarged by two members, for the purpose of presenting to the supervisors a program by which the physicians will receive remuneration for services rendered to charges of the commissioner of public welfare. Last year, owing to the depression, no fund was available for the conduct of the children's health camp, an activity which the county has always supported. When his committee presented the matter to the board of supervisors it received authority to conduct the camp as usual, with assurance that the supervisors would finance it.

Doctor McCarthy, of Cayuga County, stated that there is great need for an active public relations committee in his county. He emphasized the necessity that physicians insist on the appointment of their nominees upon health organizations, both lay and official.

Doctor Stearns, of St. Lawrence County, stated that the Committee on Tuberculosis and Public Health in his county is particularly solicitous regarding the cooperation of the county society. It has rendered especially valuable service in helping the physicians secure public health nurses. The chairman of the public health committee of the county society is also chairman of the county committee on tuberculosis and public health. In conjunction, the two organizations have recently secured tuberculosis hospital facili-

ties for people of the county. They have in past years developed very successful clinics for immunization of children against diphtheria. This year, by agreement, no clinics will be held until after the parents have been given ample opportunity to have their children immunized by the family physician. This committee has started a survey of health activities in the county along the line requested by the public relations committee and hopes to be able to report its completion at the next meeting.

About a year ago the Federation of Women's Clubs made a survey of Ogdenburg and in their report made certain recommendations regarding the manner in which health conditions might be improved.

Doctor Olin, of Jefferson County, reported that the Public Relations Committee of the Jefferson County Medical Society is composed of five members, three from the city of Watertown, and two from the country towns. The membership directly links the medical society with important lay organizations dealing with health matters. Meetings are held monthly immediately preceding the Society meetings and on occasion. He gave a long list of lay organizations whose health activities are directed by physicians who are members of the committee.

The committee works in harmonious cooperation with the public health committee of the society. During the last two years our major activity has been the promotion of the county health unit plan for Jefferson County. Through the activity of these combined committees, which were charged by the Society with the work of the promotion of this plan, the matter was presented to the Board of Supervisors December, 1930, and in cooperation with the Jefferson County Tuberculosis and Public Health Committee many addresses have been given by members of the Society throughout the county, as well as press publicity to educate the public in the provisions and advantages of the county health unit. Under these auspices a county-wide organization has been formed to work for this end, entirely under the guidance of the society. The combined committee has also presented to the society a general plan for a unit adopted to our local needs. Much effort has been put into this work, which the committee has regarded as perhaps the paramount duty of the local profession to the county at the present time.

The committee has been in consultation with the central council of the Parent-Teachers' Association of Watertown to arrange for the examination and correction of defects in pre-school children in the city, the examinations being voluntarily conducted by Doctor Heizer, school physician.

Arrangements have recently been made by the

public health and public relations committees with the Medical Inspection Bureau of the State Department of Education, for more systematic sight testing of the school children throughout the county and recording of degrees of acuity of vision, for an efficient follow-up for proper correction, and for sight-saving and education of children with more serious defects.

Doctor G. M. Fisher read a report on Oneida County sent by Doctor T. H. Farrell. This is published on page 617 of this Journal.

Doctor Clapper, of Ontario County, reported that his committee had assisted in arranging clinics for the immunization of children against diphtheria and in having the high school children of Victor x-rayed and tuberculosis tested. They are now engaged upon developing a school clinical program. He regretted that the Society's relationship with lay agencies is not as harmonious and effective as it might be.

Doctor Lape, of Broome County, said that a very successful anti-diphtheria program had been conducted in Binghamton during the past year. Much work for an active public relations committee remains to be done. Examination of school children is done almost entirely by school physicians. Last year the Y.W.C.A. sought cooperation with the medical society in giving employed women in the city a physical examination.

Doctor Lester, of Seneca County stated that cooperation with the lay agencies in his county stands much in need of development. While the relationships are cordial, yet initiative for work rests almost entirely with the lay agencies, and the need of medical supervision has not been forcibly impressed upon them.

Doctor Foster, speaking for Yates County, said that the physicians individually have very pleasant relationships with the lay agencies. The individual physician is quite satisfied with the way in which the county welfare work is conducted, but the society as such has had practically no share in any of these activities and it might be much to the advantage both of the public and the physicians if the work were systematized by a County Public Relations Committee.

Doctor Porter, of Lewis County, stated that his public relations committee is but six months old, and therefore he had not much to report; but he was stimulated by the reports he had heard and felt that he could, on his return, develop an active and useful committee. He spoke at length of the problems involving the development of the new county hospital, but he said that he thought many of the difficulties would in time right themselves. He particularly called attention to the fact that under the rules and regulations which were suggested by the public relations committee, the physicians of the county do not seem to have as much responsibility and authority as they deserve

PUBLIC RELATIONS COMMITTEE IN ONEIDA COUNTY

The following report of the Public Relations Committee of the Medical Society of the County of Oneida by its chairman Dr. T. H. Farrell of Utica, was read at a conference of the chairmen of the Public Relations Committees of fifteen counties of Central New York conducted on April 21, 1917, in Syracuse by the Committee on Public Relations of the Medical Society of the State of New York.

In reviewing the work of the Public Relations Committee of Oneida County, it may be of interest to note the factors which have made for success. In the first place, the membership of the committee was chosen with great care, so as to represent all sections of the county. Only doctors were selected who were known to take an interest in health matters beyond their own practice. Then no line of action was decided on until it had been thoroughly discussed by the full committee plus the President and Secretary of the Society. As far as possible the chairman always associated with him some other member in the personal work that is so essential in getting results.

Council on Tuberculosis and Public Health. Our first and most valuable contact was with the Oneida County Council on Tuberculosis and Public Health. This was made easy by the fact that Dr. G. M. Fisher was a member of this executive committee. The members were looking for other avenues of promoting public health besides their work for the control of tuberculosis. They welcomed most heartily the interest and cooperation of the county medical society. After a free and frank discussion with our committee they enlisted in a campaign to promote periodic health examinations. They supplied all the clerical help and arranged with various groups of women for talks by such doctors as we could persuade of the importance of this work and of their ability to tell lay people about it. The diffidence of the individual doctor to speaking in public has been one of our greatest handicaps. Once the ice is broken and he finds that he has an inexhaustible fund of information, he is keen to do it again, if he has any flair for speaking.

Tuberculosis Tests. About one year ago this organization appealed to our committee for help in extending its preventative work in the tuberculosis of children. The superintendent of our new County Tuberculosis Sanitarium was willing, yes anxious, to apply the tuberculin test to all school children, and to make x rays of the chests of those who had a positive reaction, but this met with much opposition from the school doctors. We finally succeeded in having the county society adopt a resolution to the effect that all contact cases in the schools and children underweight should be given the tuberculin test. The result is shown in table one.

Age Years	CONTACTS			NON CONTACTS		
	No Tested	% Reacting	Percent Reacting	No Tested	% Reacting	Percent Reacting
5 & under	14	11	78.5	44	1	2.5
6	4	3	75.0	92	6	6.5
7	29	14	48.0	112	20	17.0
8	14	10	71.0	110	29	26.5
9	23	18	82.0	124	53	42.0
10	24	19	79.0	129	50	39.0
11	22	20	90.0	138	82	59.0
12	22	19	86.5	80	47	58.0
13	16	14	87.0	73	45	61.0
	168	128	76.2	902	333	36.9

Table 1 Results of tuberculin tests

X-ray Tests. The superintendent of the Oneida County Tuberculosis Sanitarium also cooperated in taking x-rays of the chests of children suspected of having tuberculosis with the result shown in table 2.

	Contacts	Non Contacts
No x-rays taken	188	193
Recommended to Sanitarium	20	5
Recommended for Symptom Study	22	8
Recommended to open air class	16	5

Table 2 Result of x-ray diagnosis in 381 children

Council of Social Agencies. We are fortunate in Utica in having a Council of Social Agencies. The Council is a group of two persons—one an executive and one a Board member—from each of the eighty or more health, relief and welfare organizations in this city associated for the common good. The council is, therefore made up of persons acquainted and responsible for all work in the City of Utica, which is supported either by public or private philanthropy.

During the second year the Council for convenience, was divided into four groups, viz. Health Group, Children's Group, Family Group, and Character Building Group. These groups made special study of the work in their respective fields, taking up case study or tracing an involved social problem through the various organizations which would naturally be concerned or involved. The group leaders directed this study and the results were summarized and brought before the general council.

The health group comprises 19 organizations as follows: Board of Health, County Tuberculosis Sanitarium, Summer Tuberculosis Camp, Oneida County Tuberculosis Council, Utica Academy of Medicine, Oneida County Medical Society, 5 hospitals, Children's Hospital Home, Central Association for the Blind, School Inspectors, Dental Society, Dispensary, Visiting Nurses and Child

Health Association, Y. W. C. A., Y. M. C. A. For two years the chairman of the Public Relations Committee has been chairman of this group. In response to a questionnaire, the following special problems were suggested for study:

1. Ascertain the working forces of health agencies and the kind of services each organization is equipped to render. How can this present system be improved?

2. The education of the family in the care of children after they are dismissed from the Children's Hospital Home.

3. A clearer correlation of the child health group, schools and Camp Healthmore Organization for the prevention of tuberculosis.

4. Systematic examination of teeth in schools; who should get free service and who should pay; not a wholesale free service.

5. How best to segregate persons afflicted with infectious eye diseases.

6. Preservation of county health department.

7. Health progress as a convenient responsibility.

8. Systematic follow up work on hospital cases.

9. Periodic health examinations.

10. The cost of health and other institutional service.

This will give some idea of the diversity of interest and the lines of thinking of this group. This last winter the special problem was, "How can we improve the educational facilities for training our nurses?"

Health Talks: A work which has brought the County Society a great deal of publicity in the press is the series of health talks given in the various industrial plants in the city during the last three winters. These are under the auspices of the County Medical Society, Utica Dental Society, and the Industrial Department of the Y. M. C. A. The detail work is all done by the secretary of this latter department. We are responsible for providing fifteen doctors as speakers on topics mutually agreed upon. Some doctors enjoy speaking to the workers in these plants; some do it out of a sense of loyalty to the County Society. Part of our job is to find out how each talk went over and be guided accordingly in making up the list of speakers for the next year. The talks for winter were on these topics:

Heart strain in industry.
Visual efficiency.
Wounds and bruises.
Coughs and colds.
Contagious diseases.
Care of the teeth.

Public Welfare Law: Our relations with the Commissioner of Public Welfare have been quite cordial. One of our committee happens to be a supervisor of the county, which facilitates our relations with this department. We found that the commissioner recognized the rights of the doctors under the law, but emphasized the necessity of his adhering to certain simple rules in order to enjoy the benefits. In order to familiarize the doctors of the county with these requirements, we embodied them in a letter and later arranged for the commissioner to address the county society and to answer questions. The following standards were agreed upon for the administration of the State Welfare Law.

1. The family physician of the patient shall be employed as in private practice.

2. When a doctor is called to attend a patient under this welfare law, he shall *at once* notify the commissioner and get a written authorization for his attendance. This authorization must be renewed every two weeks for continued attendance.

3. In an emergency, the physician shall give the proper treatment at once; and within 24, or at most 48, hours, obtain the proper authorization for his treatment.

4. Additional authorization shall be obtained for unusual problems such as x-rays, laboratory analysis, consultation and surgical operations.

5. The following shall be considered standard in regard to medical fees:

Office Calls	\$1.00 to \$ 2.00
House	2.00
Uncomplicated Confinement	25.00
Surgical Operations	5.00 to 50.00
Anæsthetist	5.00
Assistant	5.00 to 10.00
Complications	Extra
Tonsil and Adenoid Operation ..	10.00
Hospital	10.00
Ordinary X-ray	5.00 to 10.00

Owing to the fact that the Medical Society of the County of Oneida a year ago last fall voted against a compulsory health department, after the Public Relations Committee had carried on a campaign of education for several months, we have done nothing further along this line so far as the doctors are concerned.

Our committee tries to keep the county society informed of the self-sacrificing work of the Public Relations Committee members of the Medical Society of the State of New York, and of their decisions and advice.

FINAL LEGISLATIVE BULLETIN

April 26, 1932

Now that the thirty-day period has expired, you are without doubt eager to have the legislative season closed on your books. There follows a statement of the bills that were enacted into law and their chapter number.

Senate Int No 256—Westall, Public Health Law, providing each city becoming part of a county health district shall be entitled to one additional representative on county health board, all members of the board to be residents of the health district. Chapter No 81.

Senate Int. No 368—Wicks, Public Health Law, by empowering health commissioner to make rules with reference to disposition of bodies of persons dying on trams, boats, or other carriers for transporting persons. Chapter No 267.

Senate Int No 399—Nunan, Greater New York Charter, to permit medical board of teachers' retirement system to designate a physician or physicians to make medical examinations. Chapter No 393.

Senate Int No 417—Lord, by providing property held for hospital purposes in name of corporation organized to manage hospital for benefit of city shall be exempt from taxation to same extent as property of corporation organized exclusively for hospital purposes. Chapter No 328.

Senate Int No 634—Wicks, Public Health Law, by requiring State Health Commissioner on request to supply certified copy of birth and death records unless same does not appear to be necessary or required for judicial or other proper purposes. Chapter No 113.

Senate Int No 635—Wicks, Public Health Law, by changing provisions relative to requirements to practice midwifery. Chapter No 198.

Senate Int No 636—Wicks, Public Health Law, relative to district records to be kept by registrars of births or deaths. Chapter No 93.

Senate Int No 913—Webb, abolishes office of coroner in Dutchess County and creates office of county medical examiner. Chapter No 376.

Senate Int No 967—Thompson, Mental Hygiene Law, by providing hospital unit at Kings Park shall be known as Veterans' Memorial Hospital division devoted exclusively to care of war veterans. Chapter No 436.

Senate Int No 1219—Wicks, Public Health Law, relative to approval of laboratory examinations by the Health Commissioner. Chapter No 310.

Senate Int No 1383—Hewitt, Education Law, relative to payment of fees, fines, penalties and other moneys into State Treasury. Chapter No 446.

Senate Int No 1444—Hewitt, Public Health

Law, by naming new state tuberculosis hospital near Ithaca as the Herman M. Biggs Memorial Hospital. Chapter No 246.

Assembly Int No 277—Esmond, Public Health Law, relative to pathogenic germs, to use of bacteria for criminal purposes and to method of transporting live germs. Chapter No 151.

Assembly Int No 440—Jenks, Mental Hygiene Law, relative to committing certain mentally defective persons to state institutions. Chapter No 73.

Assembly No 526—Ostertag, General Municipal Law, authorizing a superintendent of a public general hospital to maintain a revolving petty cash fund not to exceed \$100.00. Chapter No 102.

Assembly Int No 1137—Potter, Mental Hygiene Law, to permit use for civilian patients of acute medical and surgical building in hospital unit at Kings Park, if commissioner thinks care of veteran soldiers and sailors treated there will be promoted. Chapter No 195.

Assembly Int No 1271—Wallace, Penal Law, by making it a felony to wilfully or unjustifiably interfere with, injure, destroy or tamper with any horse, mule, dog or other domestic animal used for racing, breeding or competitive exhibition of skill. Chapter No 413.

The amendment which probably will have the widest interest is the Westall bill, which increases the number of physicians required on county health boards from two to three (chapter No 81).

May we say again that the Committee is most grateful to the chairmen for the hearty cooperation we have had this year. We hope that you will not completely lay aside your legislative ideas, but prepare immediately for a conference with the legislative candidates. Many of the societies held conferences with their legislators last fall and in every instance they were considered both by the physicians and the legislators as of great value. Two important matters that can be discussed at such conference this year are: The need of opposition to the anti-vivisection bill (dog bill) and the distinction between the Medical Society and State Departments.

We hope that you have written your legislators thanking them for their cooperation.

If changes occur in chairmanship, will you please advise Dr. Lawrence of the name of the new chairman, or have the secretary of the society do so?

HARRY ARANOW,
JOHN J. BUETTNER,
MARSHALL CLINTON,

Committee on Legislation

ONEIDA COUNTY

The monthly meeting of the Oneida County Medical Society was held on April 12 in Faxon Hospital, Dr. E. M. Griffith, Chadwicks, presiding. In the absence of Dr. T. H. Farrell, chairman of the committee on public relations, the secretary, Dr. William Hale, Jr., read his report, which included testing for tuberculosis of all city school children who are known to be contacts of other members of tubercular families. This work has been carried on by Dr. William C. Jensen of Broadacres Sanatorium, under direction of Dr. Stephen A. Mahady and Dr. James W. W. Dimon. (See page 617.)

Beginning this week the same type of work will be extended to include the entire county, under the combined efforts of Dr. Jensen and Dr. Halsey J. Ball, district health officer. Dr. Farrell's report also showed the work done for local institutions in the way of health lectures under the auspices of the Utica Dental Society and the Oneida County Medical Society so arranged by the industrial secretary of the Y.M.C.A. It is planned to have similar courses the coming year, with more industries entering into the project.

Dr. H. J. Ball, District State Health Officer, reported for the public health committee, outlining community health work that is its project.

Dr. George M. Fisher, reporting for the legislative committee, announced approval by the county society of the action taken by the Legislature in its recent session on medical bills.

Dr. F. M. Miller, reporting for the committee on medical economics, outlined the work his committee is doing as an adjunct to the committee of the State Medical Society, with particular reference to investigating the cost of sickness in families.

The speaker for the day was Dr. R. C. Van Etten, professor of obstetrics at the Physicians and Surgeons Hospital, and attending obstetrician at Sloane Hospital, New York City.

There were about sixty physicians present. Luncheon was served by the hospital staff, following which the physicians were extended the privilege of reviewing the maternity setup and inspecting minutely the operating rooms, utility rooms and ward services.

WILLIAM HALE, M.D.,
Secretary.

CORTLAND COUNTY

The Cortland County Society met at the Cortland County Hospital on April 22nd to hear a paper read by our full-time health officer, Dr. D. R. Reilly, on the timely subject "The Care of the Indigent Sick."

Dr. Reilly stated that no satisfactory plan was being followed at the present time, but a plan should be drawn up as the new Welfare Law furnished a basis on which to work. At the present time the Welfare Committee is swamped with requests and may collapse under the pressure.

Dr. Reilly believes the Iowa plan of contract between the governmental officials and the county

medical society can not be used in New York State because it would interfere with the Welfare Law.

Warning was given that if the medical profession does not act and make suitable plans, then others less able will do so and the physicians will be the losers.

President High Frail appointed the following Welfare Committee to study the subject: James Walse, Chairman, Claude E. Chapin and Dr. R. Paul Higgins.

ORTON E. WHITE, Secretary.

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Elsmere Hall on April 19, 1932, was called to order at 9 P.M., the President, Dr. Smiley, in the Chair.

Election of candidates being in order, it was moved and carried that the Secretary be instructed to cast one ballot for the following applicants for membership:

Drs. Max Hochman, George A. Howley,

William LaVine, Joseph Rosenheck and Henry L. Sanft.

The Secretary presented the Report of the Nominating Committee designating candidates for all offices for 1932-33.

Dr. Projector reported in the matter of the Study of the Report of the Governor's Committee on the Workmen's Compensation Law. The Subcommittee's Report was presented at

the meeting called by Dr. Smiley and was adopted with certain changes. This report will be ready for presentation to the Society at its next meeting and shall be brought before the State Medical Society meeting in May.

The scientific program proceeded as follows:

A. The Roles of the Internal Secretions of the Ovary in Health and Disease, Robert T. Frank.

B. The Enduring Quest for Rejuvenation: Retrospect and Prospect, Carl R. Moore.

C. Discussion, Abraham J. Rongy, Harry Aranow, Raphael Kurzrock, Joshua H. Leiner. The discussion was closed by Drs. Frank and Moore.

The President expressed the thanks of the Society to the readers of the papers and to the gentlemen who discussed them.

I. J. LANDSMAN, M.D., *Secretary*.

MONROE COUNTY

A meeting of the Medical Society of the County of Monroe was held in the Academy of Medicine Building, Rochester, on March 15, 1932, with the President, Dr. B. J. Slater, presiding.

Drs. K. E. Birkhaug, Abraham Fischer, and Frank Valve, were elected to membership.

Chairmen of Committees for 1932 were announced as follows:

Membership: Dr. J. J. Rooney.

Legislative: Dr. L. F. Simpson.

Post-Graduate: Dr. S. S. Bullen.

Public Relations: Dr. A. G. Morris.

Public Health: Dr. E. G. Whipple.

The following Sub-Committee Chairmen were also announced:

Tuberculosis: Dr. J. J. Lloyd.

Heart: Dr. R. B. Crain.

Cancer: Dr. J. M. Swan.

Social Hygiene: F. J. Garlick.

Child Welfare: Dr. John Aikman.

Communicable Diseases: Dr. G. S. Price.

Mental Diseases: Dr. Kirby Collier.

Prenatal Care: Dr. L. E. McCaffrey.

Health Education and Periodic Examinations: Dr. W. A. Sawyer.

The speaker of the evening, Dr. Grant C. Madill of Ogdensburg, N. Y., spoke on "Medical Education; Its General Trend and Problems," bringing out the following points of interest:

1. Today there are 13,000 applications for the 7,000 available accommodations in our medical school.

2. The problem of the relation of hospital practice to private practice as yet is unsolved.

3. Dr. Madill favors the awarding of advanced medical degrees for physicians who specialize in a particular field.

4. It was the opinion of the speaker that if the Regents required of all groups concerned in the treatment of the sick the equivalent of premedical training now required by all doctors of medicine, it is inconceivable that the applicant would wish to limit his activity to a single therapeutic regimen.

5. The recent legislative activity of the osteopaths was discussed by the speaker.

The meeting was adjourned at 10:20 P.M. Attendance: 64.

W. A. MACVAY, *Secretary*.

RENSSELAER COUNTY

A regular meeting of the Medical Society of the County of Rensselaer was held at the health center, Troy, on Tuesday evening, April 12th, with the President, Dr. J. B. Burke, in the chair, and the Secretary, Dr. C. J. Handron, recording.

Mr. George Roth, representing the Credit Bureau of the Chamber of Commerce, spoke on the service given by that Bureau to the merchants of Troy and vicinity. He said the Bureau furnished its patrons with information relative to the pay

habits of individuals and not opinions. Such information is impersonal and absolutely confidential.

The society went on record as approving the work of the Rensselaer County Tuberculosis and Public Health Association in eradicating tuberculosis.

Dr. Mathew Kehou of Cohoes was proposed as an associate member by Dr. Hambrook.

Dr. C. F. Kivlin addressed the society on the

subject of "Mucocoele of the Appendix." He cited a case of his own and showed photographs. It was discussed by Dr. P. L. Harvie.

Dr. Wm. B. D. Van Auken read a paper on "General Practice of Medicine before Specialism of Practice." It was discussed by Drs. C. A. Birmingham, C. Hemstreet, and T. F. Judge.

Dr. A. W. Benson read a paper entitled "Troy and the White House Conference," giving a brief description of the conference, and reporting the findings which were obtained through the cooperation of our County Society and various local welfare agencies. A corps of registered nurses made a house to house canvass and secured the necessary data in 350 families, representing 574 children. Dr. Benson reported that 65 per cent

of our pre-school children had received a health examination; 38 per cent had been immunized against diphtheria (a very good showing and due largely to the campaign in which 26 of our physicians donated their services). The figures showed that 15 per cent had been vaccinated against smallpox, and only 4 per cent had ever received a dental examination. Dr. Benson asked for a continued interest in the recommendations of the Division of the White House Conference dealing with the medical care of children.

The meeting adjourned for a social hour at 11 p.m.

WILLIAM B. D. VAN AUKEN, M.D.,
Reporter.

ROCKLAND COUNTY

Forty members of the Medical Society of the County of Rockland were guests of the Lederle Laboratories at Pearl River for their regular meeting held on Wednesday afternoon, April 27th, 1932.

A tour of inspection of the institution was made with an explanation of the use of the newer products. The recent development of liver extract for injection in the treatment of pernicious anemia was of unusual interest. The value of the maggot treatment for chronic infections was amply demonstrated. The preparation of various serums was shown.

The speaker of the day was Dr. Richard Kovacs, Professor of Physical Therapy at the Polyclinic Hospital, and Chairman of the Committee on Physical Therapy of the New York State Medical Society. Since this field, which includes all forms of electrical therapy, natural and artificial light, and massage and other forms of manipulation, is broad, the doctor could only cover it in outline, but he emphasized that such treatment should be used only by those who are well trained in the fundamentals of medicine and surgery. Many interesting lantern slides were shown.

Dr. Adolph Eichorn, Director of the Veterinary Department at Lederle, spoke of the growing menace from undulant or Malta fever, and stated that thirty per cent of all marketed milk contains the organism. The only means of preventing its transmission to man is by the active pasteurization milk. Its diagnosis can be made only by the agglutination test.

Dr. Edward Roberts and Mr. Stanley Beard, officials of the Lederle Laboratories, welcomed the members to the institution.

Dr. Russell E. Blaisdell, Superintendent of the Rockland State Hospital, invited the Medical Society to his institution for the June meeting.

A resolution on the death of Dr. Merton J. Sanford of Suffern, was presented and adopted.

The applications for membership in the Society of Dr. George G. Stone and Dr. Alan J. Maged both of Suffern were received.

Among the guests present were Dr. A. B. Hirsch of New York City, Editor of the *New York Medical Week*, and Dr. H. G. Wahlig of Seacliff, New York, Secretary of the Nassau County Medical Society.

WILLIAM J. RYAN, M.D., *Secretary.*

KINGS COUNTY

A regular meeting of the Medical Society of the County of Kings was held on Tuesday, March 15, 1932, in the MacNaughton Auditorium of the Library Building, 1313 Bedford Avenue, Brooklyn

The scientific program was as follows

- 1 Address "Method in the Study of Bright's Disease" Jean R. Oliver, M.D., Brooklyn, Professor of Pathology, Long Island College of Medicine
- 2 Address "Characteristics of Different Types of Bright's Disease" Donald D. Van Slyke, Ph.D., Sc.D., New York City, Member of Rockefeller Institute

THE MONTH IN ABSTRACT

The Director of Medical Activities reported to the Trustees and Council that during the month of February the Coordinating Committee of the Five County Medical Societies had given consideration to the health examination problem, municipal hospital conditions, and various other items, that the Coordinating Committee had received a request for action from Kings County, with regard to joint meetings between dentists and doctors, the regulation of massage operators under the Sanitary Code, and a diphtheria prevention plan. This plan had been approved by the Coordinating Committee for transmission to the other county societies.

During the month the Committee on Medical Economics had considered a number of problems, including a series of questionnaires from the American Medical Association.

The Committee on Public Health had elaborated a diphtheria program, had conducted the medical information service, which involved the answering of over thirty inquiries a week covering information on cancer hospitals, reference to physicians, assistance in locating physicians and the like, had conducted radio broadcasts, and had conferred with the Visiting Nurse Association.

The Committee on Illegal Practice had conferred with representatives of the State Department of Education regarding various complaints. During 1931 over twenty of the cases were investigated in Kings County by the Department, but had not required any action, a number of violations had been stopped without prosecution, of the cases requiring criminal prosecution all had been convicted except one that is pending trial.

The Milk Commission had conducted its usual activities and had held its regular monthly meeting. It desires to call the attention of the medical profession to the importance of Certified milk. The profession does

not thoroughly realize the nutritional value of unpasteurized milk which is produced and distributed under the supervision of the County Society—A milk received by the consumer under a seal which is placed upon the bottle at the farm—A milk which comes from cows tested for tuberculosis and undulant fever—A milk of low bacterial content, delivered by express service from the cow to the consumer—A milk, in short, which the medical profession should prescribe under all circumstances where a nutritional problem will be aided by including in the diet a fresh, clean, wholesome, natural milk.

The Sub Committee on Polymyelitis had continued its study of cases occurring in the epidemic of last Summer, and had received valued assistance from the Visiting Nurse Association hospitals and individuals. Much information is being accumulated for analysis about what did occur, the need for and the amount of after care, and similar items.

The Chamber of Commerce Public Health Committee had, through sub committees, considered the diphtheria problem, the transportation of polymyelitis cases in need of orthopedic clinic care, and similar problems of community interest in the field of health.

On March 1, 1932, the Executive Committee of the Second District Branch met in the offices of the Queens County Medical Society, to consider plans for future activities of the Second District Branch. It was decided that the Second District Branch would hold an informal outing and meeting in June, Queens County Medical Society acting as host. It was also decided that the regular annual meeting would be held on November 17th, 1932, at the Hotel St. George, in Brooklyn, with Kings County acting as host. A clinical program is to be arranged for the annual meeting in November. The committee from the Medical Society of the County of Kings, arranging the scientific program, will provide formal papers for the meeting on the evening of November 17th. This committee has arranged for clinics and conferences at various hospitals for the morning of November 18th, and, on the afternoon of the 18th, demonstrations of fresh pathology, presented from the point of view of pathologists and clinicians. During these two days, it is expected that the Section on Pathology of the Medical Society of the County of Kings will provide a suitable exhibit, correlated with the program to be arranged.

Our librarian, Mr. Charles Frankenberger, is giving his annual course of lectures to the first year men of the Long Island College of Medicine, on "Medical Literature and Bibliology."

The purpose of these lectures is to acquaint medical students with the literature of their profession; to instruct them in the use of the various bibliographic indices and reference works; and to explain the first steps in consulting medical literature. The Long Island

College of Medicine is the first medical school to inaugurate such a course as a required part of its curriculum.

JOSEPH RAPHAEL, M. D.,
Associate Secretary.

A regular meeting of the Medical Society of the County of Kings was held on Tuesday, April 19, 1932, in the MacNaughton Auditorium of the Library Building, 1313 Bedford Avenue, Brooklyn.

The following scientific program was presented:

1. Address: "Histological, Pathological and Bacteriological Considerations in Valvular Defects in Rheumatic Fever." Louis Gross, M.D., New York City.

2. Address: "Undulant Fever" (Brucelliasis). Walter M. Simpson, M.D., F.A.C.P., Dayton, Ohio.

In his monthly report to the Council of the Society, the Director of Medical Activities indicated the increasing volume of work that has been coming before the Society. In illustration, he stated that he had attended a number of meetings and conferences outside of the Society building, and that committee activities in the form of meetings and special work on the part of committee members had been greater than usual.

It was reported that the Executive Committee of the Second District Branch had formulated plans for an outing meeting on Wednesday, June 8th, at a golf club, with Queens County acting as host. The Executive Committee of the Branch also determined to hold the 26th Annual Meeting on Thursday, November 17, 1932, in Brooklyn, repeating the successful scientific meeting and banquet which was held last November. The tentative program calls for a morning devoted to clinics, an afternoon of papers on practical medical topics, and an evening banquet and business meeting, at which the officers of the Branch will be elected for the coming year.

With regard to medical service under the home relief plan, the Director reported that the City's inability to provide sufficient funds had resulted in a few authorizations for physicians to receive. Those which had been given were for payment through the Society office.

Dr. J. H. H. attended the Tenth Annual Con-Milbank Memorial Fund and deliberations of the Section on The conference, as a whole, had and endorsed a report from the 4 Centers. Surgeon-General

Cumming of the United States Public Health Service presented the Section's report which indicated the difference between the promotion of preventive medicine as an educational procedure and the application of the principles of preventive medicine, which is the practice of medicine and surgery and should be conducted by the medical facilities of the community rather than by the health agencies. The Conference adopted the recommendation of the Health Center Section that "Every health center should have as one of its important functions a definite program for the development of cooperation between families and physicians to the end that there shall be more universal participation (outside of official health work) in preventive medicine and health promotion. This would involve the development of such a program through county medical societies and the adequate provision of personnel for the organized medical profession."

The Milk Commission and the Special Committee appointed by the Council has been particularly active during the month.

The Committee on Medical Economics, through various sub-committees, has been active during the month considering the problems of group practice, contract practice, the dispensary question, the workmen's compensation problem, and the like. Its members have attended many meetings.

The work of the Committee on Illegal Practice during the month involved a number of conferences with representatives of the State Department. Some anonymous complaints were received with regard to the practice of medicine by unlicensed individuals. Such complaints usually receive no consideration. Investigation in one case brought out the apparent fact, as was to be expected, that a complainant lacking sufficient stamina to give a name, is in all likelihood spitefully attempting to harass an individual. The person complained about indicated a desire for a full investigation and offered to cooperate.

The educational activities of the Society during the month have been confined, as far as the laity are concerned, to radio broadcasts and one talk on Diphtheria.

A special diphtheria program is being conducted by the Department of Health in the section of Brooklyn known as the Red Hook-Gowanus Health District. This area is bounded

by the East River, Gowanus Canal, Atlantic Avenue, Flatbush Avenue, Prospect Park West and Ninth Street. Physicians practising in this section are requested to report to the Committee on Public Health their observations in regard to Diphtheria work, and to urge their clientele to

have their children immunized in the physician's office.

The Friday afternoon lectures at five o'clock on clinical subjects are being continued under the management of the Kings County Medical Society.

A special meeting of the Medical Society of the County of Kings was held on Thursday, April 28, 1932, in the Library Building, under the auspices of the Committee on Medical Economics.

At this meeting there was an endorsement of the formation of a Loan and Relief Committee to

seek out and aid those members of the medical profession in the county who may be in need of financial help. Other questions discussed were the dispensary problem, the economic aspects of health examinations, group clinic activities, and compensation cases.

ALBANY COUNTY

The February meeting of the Medical Society of the County of Albany was held in the auditorium of the Albany College of Pharmacy on Tuesday evening, February 23, 1932.

On motion of Dr. James N. Vander Veer the Society accepted the recommendation of the Press Relations Committee of the State Society that we affiliate with the Third District Branch Group. The President was instructed to appoint one member to serve as our local representative. Dr. Arthur W. Wright, Director of the Bender Hygienic Laboratory, was subsequently appointed.

A memorial of our late member, Dr. Baxter T. Smeltzer, was read by Dr. La Salle Archambault, and on motion of the Society these resolutions were ordered spread upon our minutes and copies sent to the family of the deceased.

Dr. Curtis T. Prout was unanimously elected to membership.

The resignation of Dr. M. J. Keough of Cohoes was presented and accepted.

On motion of Dr. Daniel O'Leary the President was instructed to appoint a special committee to confer with the Council of Social Agencies for the purpose of considering a program of establishing a central registry for dispensary patients.

The scientific program was presented by the following physicians, all members of our society:

"Recent Progress in the Study of Focal Infections," Dr. James W. Bucci. Discussion led by Dr. Kenneth Crounse.

"Gas Gangrene Complicating Appendicitis," Dr. Clarence Traver. Discussion led by Dr. Edgar A. Vander Veer.

"Carcinoma of the Body of the Uterus Associated with Pregnancy," Dr. Arthur J. Wallingford. Discussion led by Dr. John A. Sampson.

"Excretion Urography," Dr. I. J. Murname. Discussion led by Dr. James N. Vander Veer.

The Society had no delinquent members during the past year. I quote from a letter recently received by our Treasurer, Dr. Frances E. Vosburgh, from Dr. Frederick E. Sondern, Treasurer of the Medical Society of the State of New York:

"Thank you very much for your check, thus placing Albany County in the well deserved and much to be envied position of an Honor County, something I do not think has ever happened before in any county with a membership of 249."

HOMER L. NELMS, Secretary.

DUTCHESS-PUTNAM

A regular meeting of the Dutchess-Putnam Medical Society was held on Wednesday, November 18, 1931, at 9 p.m. at Vassar Brothers Hospital, Poughkeepsie, N. Y., with the Vice-President, Dr. William H. Krieger, in the Chair.

The following physicians of Poughkeepsie were elected to membership.

Drs. B. E. Roberts, H. J. Christensen, and H. C. Rosenthal.

Drs. Sobel, Breed and Gosse were appointed a nominating committee to report at the December meeting.

Dr. J. E. Sadlier presented a memorial to the late Dr. Samuel I. Jacobus, who practiced medicine in the village of Millbrook for forty-three years until his death on August 12, 1931, aged 70 years. The outstanding service recorded in the memorial was as follows:

Dr. Jacobus kept in touch with each advance in surgery as well as medicine and saw that his patients, poor and rich alike, received the benefit of such knowledge. Hence for many years the Town of Washington was in the advance guard in having proper and timely attention given to such cases. Again this intense interest in his patients and desire for their welfare was duplicated by his co-worker and friend, the late Dr. David H. MacKenzie, and together they gave to their com-

munity an advanced type of service which speaks in no uncertain terms of the advantage of the personal and individual attention of the family physician, and constitutes a warning to those who would relegate medicine to state control or any other plan which subordinates the family doctor.

The following special committee on Economics was appointed:

Dr. A. W. Thomson, Chairman; Drs. S. E. Appel and Earle Voorhees.

Scientific Program:

Dr. Albert Pfeiffer and Dr. James N. Vander Veer of Albany addressed the Society on "The Venereal Disease Program."

Present: Drs. Pfeiffer, Krieger, Rogers, Williams, Conger, Gosse, Jacobus, Breed, Bulkley, Cadwell, Peckham, Coborn, Poucher, Christensen, Rivenburgh, Borst, Card, Le Soine, Conklin, Marks, C. E. Lane, Davison, Voorhees, Wicks, Tabor, O'Neill, three Vassar Brothers Hospital internes, Rosenthal, Harrington, Vander Veer, Carpenter, Deyo, Leonidoff, Stoller, Sobel, Stibbs, Harold Crispell, Sadlier, C. A. Crispell, J. N. Boyce, Mr. Spross and Mrs. Myers. Total, 44.

The meeting adjourned at 11:15 p.m. for refreshments.

H. P. CARPENTER, *Secretary*.

A regular meeting of the Dutchess-Putnam Medical Society was held at St. Francis Hospital, Poughkeepsie, N. Y., April 13, 1932, at 8:45 p.m., with the President, Dr. William A. Krieger in the chair.

Dr. Burton T. Simpson, Director, New York State Institute for the Study of Malignant Disease, gave a paper on "The Responsibility of the Practicing Physician in the Control of Cancer."

Discussion by Drs. Pallister, Marks, Breed, Sadlier and Card.

Dr. Maurice C. Ashley, of Wappingers Falls, N. Y., was elected to membership.

Dr. John A. Card gave a verbal report of the legislative committee.

Dr. J. W. Poucher read the following memorial to the late Doctor Burns.

"Dr. Edward M. Burns, during his thirty-seven years of professional life, has typified the ideal relationship between patient and physician. Service in its truest, broadest meaning actuated him in his work. He gave freely of his knowledge and skill acquired by years of study and hard earned experience, but always with so much humanity and kindness that it had become so natural to him that it was expected and was always given. He was worthy of the following epitaph by Kipling:

"For as he trod that day to God
So walked he from his birth,
In simpleness, and gentleness, and honor, and
clean mirth."

See also the editorial on page 397 of the April first Journal.

A report of the committee on blindness was read and the President was appointed chairman of the committee to act with Doctors Card and Roberts on the report.

The meeting adjourned at 10:45 p.m. for refreshments.

Thirty-seven members were present as follows:

Drs. Krieger, Cavanaugh, Palliser, Peckham, Thomson, Borst, Rogers, Tabor, Gilbert C. MacKenzie, Bauer, O'Brien, Breed, Marks, Card, Roberts, Rivenburgh, Carpenter, Sadlier, Christensen, Voorhees, Simpson, Gosse, C. J. McCambridge, Richard Boyce, Sobel, Poucher, Malone, J. N. Boyce, Davison, Toomey, Price, Green, Simon, Harrington, Rosenthal, Coborn, Benson.

Twenty-four nurses from St. Francis Hospital were also present.

H. P. CARPENTER, *Secretary*.

THE DAILY PRESS

Reg'lar Fellers

His First Flight

By Gene Byrnes

From New York Herald Tribune January 22 1937

THE PHYSIOLOGICAL EFFECTS OF COLOR

The appreciation of color may be as keen as that of sound, but it is far more rare. Yet there are a few people in whom jarring colors produce the same degree of discomfort that discordant noises induce. The laws of color harmony are as definite as those of music, but most persons are blind to them, and even deaf to their vocabulary. The *New York Herald Tribune* of March 30 describes a lecture on the laws of color, a description of which is reproduced here in order to inform physicians that there is a scientific basis for the suffering which color sensitive persons undergo when they are compelled to look at jarring colors.

"The laws of color as they apply to modern designs in fabrics, costume design and interior decorating were described by Miss Grace Cornell, associate instructor in the education de-

partment of the Metropolitan Museum of Art, in a lecture before the Fashion Group yesterday afternoon at the museum.

"She described color knowledge as coming from three sources in the experience of every individual. These included the sight of colored objects in gardens, or grocery store windows, colors of the passing moment and not to be studied too seriously, second, colors to be studied and appreciated, such as the design in an Oriental rug, and third, colors which stirred the emotions, such as those in a magnificent sunset or a Titian painting.

"The three elements in color she described as value, chroma and hue. These were applied on the stage to two interior decorating schemes, one warm and one cool, and to three costume schemes all using Corsair blue, but varied to suit the individuality of the model."

FINGERPRINTS

The *New York Times* of March 28, comments editorially on the value of fingerprints.

"At the hearing in Albany last week on the pistol bills, Governor Roosevelt asked one of the champions of the new legislation if he thought it derogatory to be fingerprinted. 'Yes, I certainly do,' was the reply, 'and there are thousands of other citizens who feel the same way.' 'Well,' the Governor rejoined, 'I don't.' The witness was probably right about the number of citizens who felt the way he did about it. There is no prejudice more persistent than that against the taking of fingerprints

save as a method of criminal identification. But it is an utterly unreasoning prejudice. Why is it more degrading to press one's thumb on a piece of paper than to sign one's name to it? Hundreds of thousands of soldiers in the A E F had their fingerprints taken without dishonor. Nobody can apply for a job in the Federal civil service today—an honorable fellowship—without submitting to the fingerprint test.

"An up State judge warned the Governor that 'a majority of up-State citizens' refused to obey the present law requiring fingerprints

as a condition of pistol permits. If that is so, they are the victims of superstition, and need the 'schooling' the witness sarcastically suggested. In the old days even kings had no objection to having their fingerprints taken. They used them for seals. That the prints have since come into almost universal use as a means of identifying criminals only goes to show to how much wider use they could appropriately be put in ordinary civil life. A signature can be forged, but not a fingerprint. Even a man who cannot write need never lack identification so long as he has a thumb or two. Already baby footprints are recorded in hospitals throughout the land. The day will come when fingerprinting will be considered as much a matter of course as having one's photograph taken."

The *New York Herald Tribune* of April 7 contained the following item on the demand for fingerprinting in New York City:

"Since the kidnaping of Charles A. Lindbergh, Jr., many parents have applied to the New York Police Department to have their children fingerprinted, it was revealed yesterday by Commissioner Edward P. Mulrooney. The requests were granted in every instance, and all prints were turned over to the parents. Most of the requests came from the better residential sections of Manhattan.

"Although the Police Department is not prepared to handle the task, Commissioner Mulrooney believes some system of universal fingerprinting would be of benefit to persons of all ages. It would serve as positive means of identification under all circumstances."

THE GINSENG MARKET

The effects of international trade ramify to the remotest sections of the United States, as is shown by the following editorial in the *New York Sun* of March 26:

"Compton, an Ozark hill town of northern Arkansas, is about as far from Shanghai as it is possible for a place to be and it might be supposed that in interests its forty-four inhabitants had nothing in common with Shanghai's thousands or China's millions. In that estimate, however, the world failed to take into consideration the influence of world commerce. The New York market did not watch more closely the course of the present trouble in the Far East than did this small town in the Ozark hills. The reason is evident. Compton is the seat, the center, of the production in America of the Chinese sacred medicinal plant ginseng. It sends to China a ginseng which the natives say comes near to comparing favorably with the original Korean product, and in this it had a monopoly. The market, which had been good for more than a quarter of a century, went "all to the hound dogs" when the Japanese and the Chinese began fighting in Manchuria.

From \$50 or \$40 a packet the sacred root dropped to less than a dollar, and a dull market at that price. Wall Street could not voice a louder complaint than did Compton.

"The Korean supply had been falling off for years and the Chinese Emperor had ordered a complete discontinuance of the cultivation and sale until the soil had recovered its natural strength and productivity. Much of the American offering was pronounced lacking in the desired medicinal properties, and eventually about the only rival which the Ozarks had in production was the ginseng found in the hills of eastern Kentucky, a region similar in soil qualities, moisture and sunshine to the northern Arkansas hills.

"Compton has not lost hope; it is passing through its dull period cheerily, inspired by the faith that when the Far East war is over its ginseng will find a new and better market. Commerce has a long arm and distance seems to count little in its calculation. Somehow it has the capacity for carrying the best that the maker can produce to the market where it has the best sale."

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.

- CLINICAL ATLAS OF BLOOD DISEASES** By A. PINEY, M.D., M.R.C.P. and STANLEY WYARD, M.D., M.R.C.P. Second edition. Octavo of 105 pages, illustrated. Philadelphia, P. Blakiston's Son & Co. Inc., 1932. Cloth, \$4.00.
- MAN AND MICROBES** By STANHOPE BAYNE-JONES, M.D. 12mo of 128 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1932. Cloth, \$1.00 (A Century of Progress Series).
- APPLIED PHARMACOLOGY** By A. J. CLARK, M.C., M.D. Fourth edition. Octavo of 590 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc., 1932. Cloth, \$4.00.
- BIOCHEMISTRY IN INTERNAL MEDICINE** By MAY TRUMPER, Ph.D. and ABRAHAM CANTROW, M.D. Octavo of 454 pages, illustrated. Philadelphia, W. B. Saunders Company, 1932. Cloth, \$5.50.
- MANUAL OF BACTERIOLOGY** By ROBERT MUIR, M.A., M.D. and the late JAMES RITCHIE, M.D. Ninth edition revised by CARL H. BROWNING, M.D., D.P.H., and THOMAS J. MACFARLANE, M.D., D.P.H. 12mo of 866 pages, illustrated. New York, Oxford University Press, 1932. Cloth, \$4.75 (Oxford Medical Publications).
- A TEXT BOOK OF PSYCHIATRY FOR STUDENTS AND PRACTITIONERS** By D. K. HENDERSON, M.D., F.R.P.S. and R. D. GILLESPIE, M.D., M.R.C.P. Third edition. Octavo of 595 pages. New York, Oxford University Press, 1932. Cloth, \$4.50 (Oxford Medical Publications).
- A SURVEY OF THE MEDICAL FACILITIES OF THE STATE OF VERMONT** By ALTON PEEBLES, Ph.D. Octavo of 321 pages. Chicago, The University of Chicago Press [c. 1932]. Paper, \$1.50 (Publications of the Committee on the Costs of Medical Care No. 13).
- MIDWIVES, CHIROPODISTS, AND OPTOMETRISTS Their Place in Medical Care** By LOUIS S. REED, Ph.D. Octavo of 70 pages. Chicago, The University of Chicago Press [c. 1932]. Paper, \$1.00 (Publications of the Committee on the Costs of Medical Care No. 15).
- SURGICAL CLINICS OF NORTH AMERICA** Vol. 12, No. 2, April, 1932 (New York Number). Published every other month by the W. B. Saunders Company. Philadelphia and London. Per Clinic Year (6 issues). Cloth, \$16.00 net, paper, \$12.00 net.
- TEXT-BOOK OF MASSAGE AND REMEDIAL GYMNASTICS** By L. L. DESPARD. Third edition. Quarto of 474 pages, illustrated. New York, Oxford University Press, 1932. Cloth, \$6.00 (Oxford Medical Publications).
- DISEASES OF THE KIDNEY** By W. GIRLING BALL, F.R.C.S. and GOSFREY EVANS, M.D., F.R.C.P. Octavo of 424 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc., 1932. Cloth, \$7.50.
- RECENT ADVANCES IN BACTERIOLOGY AND THE STUDY OF THE INFECTIONS** By J. HENRY DIBLE, M.B., F.R.C.P. Second Edition. Octavo of 476 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc., 1932. Cloth, \$3.50.
- HANDBOOK OF TROPICAL FEVERS** By N. P. JEWELL, M.D., D.P.H. and W. H. KAUNTZ, M.D., D.P.H. Octavo of 485 pages, illustrated. New York, William Wood & Company, 1932. Cloth, \$6.00.
- MENTAL NURSING (SIMPLIFIED)** By O. P. NAPIER PEARNS, M.R.C.S., L.R.C.P. 16mo of 304 pages, illustrated. New York, William Wood & Company, 1932. Cloth, \$2.00.

BOOK REVIEWS

EMERGENCY SURGERY. By JOHN WILLIAM SLUSS, A.M., M.D., and JOHN WALTER MARTIN, M.D., F.A.C.S. Assisted by DAVID HART SLUSS, M.D., F.A.C.S., and CAMILIUS BOWEN DEMOTTE, B.D., M.D. Fifth edition. 12mo of 879 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc., 1931. Flexible cloth, \$5.00.

In these pages we have a broad and fairly lucid attempt to describe under the heading of Emergency Surgery the more urgent of the surgical procedures.

The authors have assembled in readable form a mass of material which, for many physicians, may not otherwise be readily available.

While we cannot agree that the outline has been strictly limited to Emergency Surgery, the inclusions are conceded as perhaps necessary to the development of the entire theme. In the chapter on Anesthesia the reference to Ether as being the safest emergency anesthetic is the statement of greatest value. The section on Spinal Anesthesia may well have been limited to the final paragraph.

As stated in the preface the volume should be of most value to the physician doing occasional surgery of the emergency type. This value is attested by the issue of a Fifth edition in a book of convenient size and printed in very legible type.

STANLEY B. THOMAS.

ILLUSTRATED PRIMER ON FRACTURES. Prepared by the Cooperative Committee on Fractures. Under Auspices of Section on Surgery, General and Abdominal and Section on Orthopedic Surgery in cooperation with Department of Scientific Exhibit of the American Medical Association. Second edition, revised and re-edited. Quarto of 63 pages, illustrated. Chicago, American Medical Association, 1931. Cloth, \$1.00.

This booklet is, as its name implies, a Primer on fractures, and furnishes in a brief and concise manner a wealth of material, and the collective thoughts of the best and most experienced minds on that subject.

Unfortunately, its brevity limits its description to a degree that makes it inadequate for the successful treatment of any fracture. It deserves especial favorable commendation on its advice on immediate splinting traction when necessary, and on the repeated urgings of X-Rays, Antero-posterior and lateral views, especially after reduction and other emergency measures advocated.

The use of the slow or medium setting plaster of paris as advocated, is of no advantage and may allow the displacement of the reduced fracture before it is fully hardened.

As a means of warning against the pitfalls in the treatment of this very important branch of surgery, it is invaluable.

As a guide to the proper treatment of fractures it lacks the most necessary detail and one would be obliged to obtain that information from a standard text book on the subject, or better still, through proper hospital or other training.

One cannot fail to note with favor the sound advice given on the reduction and immobilization of various types of fractures, as well as on the advantage of early active motion of the injured limb, especially when the fractures are at or near a joint.

The text within these covers is freely illustrated by a number of drawings and diagrams, which are very simple and self-explanatory.

Anyone treating fractures, cannot upon thorough digestion of the contents of this book, no matter what the

amount of his previous experience had been, fails to gain some additional concrete knowledge to his present foundation.

N. H. RACHLIN.

TABLES OF FOOD VALUES. By ALICE V. BRADLEY, B.S. Quarto of 128 pages. Peoria, Ill., The Manual Arts Press, [c.1931]. Cloth, \$2.00.

Miss Bradley presents a very valuable compilation of foods and their values. It is divided into two parts. Part 1 contains tables showing the food value of ordinary servings of commonly used foods. In addition to the carbohydrate, protein, fat and caloric values of foods, there are listed Ca, P and Fe content, vitamin value, value as source of bulk and the acid or base reaction of the ash. In the second part the same properties are classified and calculated on a percentage basis in 100 gram portions.

It is a valuable ready reference for anyone interested in the nutritional value of foods.

WILLIAM S. COLLENS.

THE INBORN FACTORS IN DISEASE: An Essay. By ARCHIBALD E. GARROD, K.C.M.G., D.M. 12mo of 160 pages. Oxford, Clarendon Press, 1931. Cloth, \$2.75.

It was known as early as the beginning of the Christian era that some individuals are more liable to disease than others and that diseases have peculiar familial and hereditary characters. In the prologue the author presents an interesting history of the writings on diathesis. The book is divided into two parts: first on the basic principles of predisposition to disease and second, on the types of predisposition. Prof. Garrod supports Aristotle's definition of health as being "an inborn capacity to easy resistance to those unhealthy influences that may ordinarily arise," and disease "a lack of the capacity." Thus the author elaborates on these inborn capacities as being or varying qualitative differences. For example the tubercle bacillus on invading the human organism will manifest varying types of clinical syndromes depending upon the individual resistance or vulnerability of the individual. While in one case its presence is recognized by invasion of the lungs, in another it will invade the meninges. Again some infants will develop scurvy on diets which others can take with impunity. There are interesting chapters on the chemical basis of individuality, and the inheritance of morbid liabilities. In the second part of the book the author discusses the kinds of predispositions and takes up systematically the role of structure in disease and tissue defects. He cites examples of the inherited character of these rarer abiotrophies such as myositis ossificans, or the syndrome of blue sclera and brittle bones as of mesodermal defects. Ectodermal defects are illustrated by absence of teeth or absence of sweat glands. The brittleness of red blood cells occurring in hemolytic jaundice seems to be another manifestation of an inborn tissue defect. And so occur the chemical defects which are manifested by variations in resistance to infection, errors in metabolism such as oochronosis, cystinuria, biliary calculus formation, osteoarthritis and finally chemical defects as exist in the immunological diseases such as the allergies.

The author has written a beautiful and stimulating essay and has expressed in fine literary style the philosophic conclusions of many years of study of the nature of disease. The reader is forced to agree while reading this interesting book that the Mendelian law of recessives and dominants plays an enormous part in the natural history of conditions which we call diseased states.

WILLIAM S. COLLENS.

DIAGNOSIS IN JOINT DISEASE A Clinical and Pathological Study of Arthritis By NATHANIEL ALLISON M.D., F.A.C.S., and RALPH GHORNEY, M.D. Quarto of 196 pages, illustrated. New York William Wood and Company, 1931. Cloth \$11.00

This treatise is a Clinical and Pathological study of arthritis from the Orthopedic Service of the Massachusetts General Hospital and the Harvard Medical School assisted by the DeLamar Mobile Research Fund. The period of the study was the years 1924 to 1930. The number of cases studied were 289.

The great object in the study was more definitely to determine a true diagnosis of each case by covering all possible findings, to weigh each finding as to its relation with the disease and so come to an intelligent solution of the problem. Furthermore a very definite thought in the work is an attempt at simplification of the nomenclature.

One who reviews this book is tempted to give his own working classification of arthritis but such a display would only confuse the attempt of the authors. Like most classifications the authors go very well on the bacterial side but confusion occurs when they come to the arthritis of truly unknown etiology when they must swing from that which causes the condition to the result.

The book closes with a large number of case histories that are exceedingly interesting and instructive. The illustrations and make up of the book are most excellent. J. A. C. R.

MEDICAL ELECTRICITY FOR STUDENTS By A. R. I. BROWNE. Third edition. 12mo of 245 pages illustrated. New York Oxford University Press [c1931]. Cloth \$4.00 (Oxford Medical Publications).

In this excellent book the author presents a most concise and yet inclusive exposition of the basic principles of medical electricity. The volume is divided into three parts devoted respectively to electricity and magnetism, medical apparatus and electrical treatment. There are interesting chapters covering the basic elements of electro physics as well as the more technical descriptions of apparatus and treatment. The book is well written in a most fascinating and interesting manner. It is clearly printed and illustrated and can be highly recommended to the practitioner as well as to the student of physical therapy. JEROME WEISS

MODERN MEDICAL TREATMENT By C. BELLINGHAM SMITH M.D. FRCP, and ANTHONY FILLING M.D., FRCP. Two volumes. Octavo of 1406 pages illustrated. New York, William Wood and Company, 1931. Cloth \$12.00

These two volumes on Modern Medical Treatment are carefully written, accurate, concise and present the subject in a comprehensive manner. The more usual conditions of disease of the various systems are clearly given and differential diagnoses are stated with especial emphasis on pathological conditions of the nervous system and the digestive system given in the greatest detail. A study of this work will well repay one and give a clear idea as to treatment as followed out by the British. This work is printed in Great Britain is excellently presented and a work of which the publishers may feel well satisfied. HENRY M. MOSES

APPROVED LABORATORY TECHNIC Clinical Pathological, Bacteriological, Serological, Biochemical, Histological. Prepared under the Auspices of the American Society of Clinical Pathologists by JOHN A. KOHLER M.D., DR. P. H. and FRED. BOERNER V.M.D. Assisted by C. ZENT GARNER A. B. M.D. Octavo of 663 pages illustrated. New York and London, D. Appleton and Company, 1931. Cloth, \$7.50

The Approved Laboratory Technique comprises a well assorted and large number of procedures, which practically cover the whole field of clinical and experimental laboratory work. The authors deserve particular praise for the clarity of their description and lucidity with which the subject is presented.

It does not detract essentially from the value of this book that the authors failed to give sufficiently detailed instructions in some points. Thus no mention is made of the fact that the determination of blood in the feces is of no value unless the patient has been on an appropriate diet for a number of days. Another instance of this kind is the omission of a catalysing agent (palladium) the presence of which is necessary if anaerobic cultures are to be made in a hydrogen medium according to Smilie.

In the discussion of vaccines it is said that bacillus proteus does not lend itself for the purpose of vaccine preparation. Yet to quote the recently appeared British system of bacteriology, bacillus proteus vaccines have been of service in the treatment of various conditions.

It is regrettable that in the discussion of sedimentation tests the Westergren method is omitted which is quite popular in many institutions in this country and probably the most widely used method abroad. We cannot fail to draw the attention to the discussion of the pregnancy tests in this book. The test given as Aschheim Zondek test differs from the one described by Zondek in his last few communications. This book advises to inject five mice once with different amounts of urine, whereas the real Aschheim Zondek test requires repeated injections of the same amount into all five animals. We wonder if following the instructions given in this book would not prove to be misleading.

It is somewhat surprising to note that the important chapter on complement fixation tests goes under the name of Kolmer's test for complement fixation. As a matter of fact Kolmer's test is a modification of Wassermann's reaction and of the test devised by Bordet and Gengou for complement fixation in general. Wassermann's name which is attached to the complement fixation test for syphilis all over the world does not once appear in these pages with the exception of the index where the reader is referred to Kolmer's test. We are sure most readers would be inclined to appreciate Kolmer's valuable work much more if due credit would be given to the real originators of the procedure.

As a whole the book seems to be a valuable aid in the performance of the daily laboratory routine.

M. A. GOLDBIEHER

CHILD HEALTH AND THE COMMUNITY An Interpretation of Cooperative Effort in Public Health By COURTNEY DINWIDDIE. Octavo of 80 pages illustrated. New York The Commonwealth Fund 1931. Cloth \$1.00

This is a publication of the Commonwealth Fund child health program. There were four communities of a population of 100,000 to 120,000 each selected from various sections of the country and in each a child health program was instituted by the Child Health Demonstration Committee administrators of the Commonwealth Fund for this work. Maternal and child health services were set up. The relation of the physician and general public to these services is taken up. There is an appendix which takes up some of the technical work in more detail and a complete bibliography.

The work shows how a small city or rural county may set up a well rounded community health service program and include the expense as part of its yearly budget. From the standpoint of the physician a plea is made for greater training in the medical schools in the field of preventive medicine and in public health.

STANLEY S. LAMM

OUR NEIGHBORS

DISTRIBUTION OF PHYSICIANS IN INDIANA

The leading article in the April issue of the Journal of the Indiana State Medical Association is on the subject "The distribution of physicians in Indiana," by Dr. Thurman B. Rice, of Indianapolis, Associate Professor of Bacteriology and Public Health in the Medical School of the University of Indiana. The article is intensely practical and readable and will have a strong appeal to every physician who is interested in Medical Economics.

Dr. Rice had in view an immediate object which he stated as follows:

medical service. In particular it has been intended to help the graduates of Indiana University School of Medicine in the momentous decision which faces every graduate. The study is one of several that are being made concerning matters pertaining to the distribution of disease in Indiana. Economic, sociological, political, racial, and every other sort of relation that might be of medical interest are being represented in form similar to the figures herein represented.

"Indiana is a particularly favorable state for such a study for several reasons. 1. It is a perfectly balanced state as a result of the fact that its only really large city is in the exact geographical center of the state, and its cities of secondary size are distributed evenly about the periphery. 2. It has no large foreign problem. 3. It has no large negro problem. 4. It has good vital statistics, having been in the United States Registration Area for Deaths since 1900. 5. It is at the center of population of the United States. 6. It is a state that is well known for the reason that it is crossed by nearly all travelers who go between the East and the West or Middle West. 7. It is the smallest state (in area) west of the Allegheny Mountains and so can be studied easily by one who is located centrally. 8. It is perhaps the best example of an 'average' state.

"This paper is offered in the hope that it may serve to stimulate other similar studies. We have no doubt that many of the same relations that are found to exist in Indiana have their counterparts in other states."

The essential element in the article is a series of twenty-one maps on the following subjects which are indicated by shadings:

Map 1. Population per physician in the United States by States.

Map 2. Wealth per capita, by States.

Map 3. Population per physician in practice in Indiana.

Map 4. Average age of physicians in actual practice.

Map 5. Medical supply and demand.

Map 6. The distribution of urban and rural population.

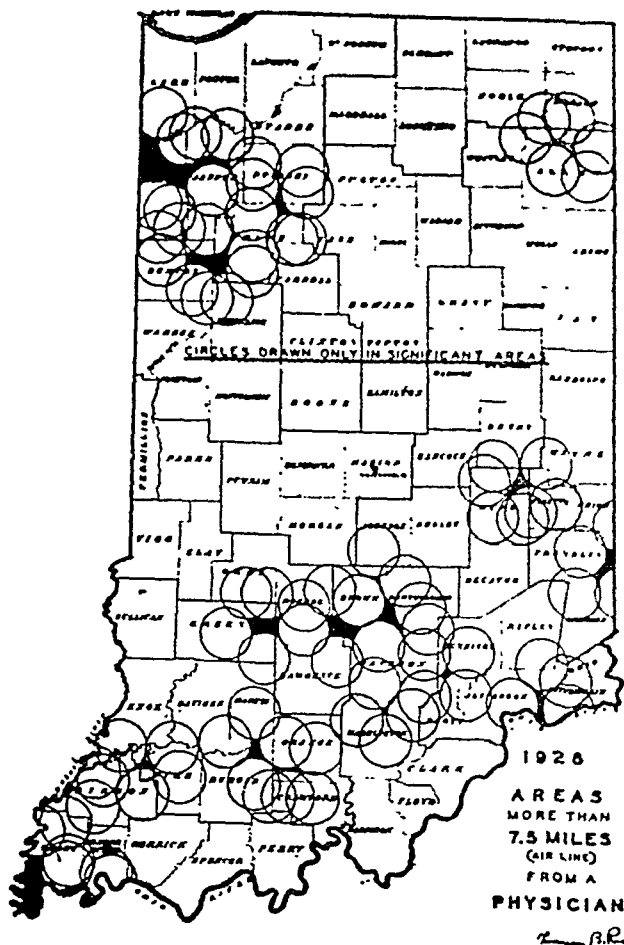

Map 7. Loss in population since the last census.

Map 8. Gain in population since last census.

Map 9. Assessed wealth per capita of the population.

Map 10. Assessed wealth of the county per physician.

(Continued on page 634—adv. xii)

Distribution of physicians in Indiana. The black sections indicate those areas which are more than seven and one half miles from a doctor.

"The present study was begun with the intention of making available information concerning the distribution of physicians and other facilities which may be of interest to the members of the profession, to young graduates seeking locations, and to communities which may be in need of

The *standard* Infant-Diet Modifier

THE addition of Robinson's "Pat-ent" Barley to the diet of the normal, healthy infant breaks down the large clots that result from the curdling of cow's milk and makes the mixture curdle in a manner similar to human milk. Thus the feeding is more easily assimilated.

Its slightly starchy content gradually acclimatizes the baby to the starchy foods which will later form the major part of his diet

IT IS VALUABLE as a diluent instead of water, because of its soothing, demulcent effect on the stomach and intestines of the baby

And it solves many of the difficulties of infant feeding. In cases of partial intolerance to milk fat, it is a most successful carbohydrate substitute. The starch in Robinson's "Patent" Barley is absorbed more slowly than soluble sugar...since it has to be con-

verted through the stages of dextrin and maltose to dextrose before it is absorbed. Thus, absorption proceeds gradually and there is no danger of fermentation in the intestines.

In adult dietaries, also...during pregnancy, in cases of intestinal and kidney diseases, and in post-operative feeding — Robinson's "Patent" Barley is used constantly with success.

ROBINSON'S "PATENT" BARLEY is scientifically milled and sealed in tins which protect the flour and preserve its freshness. Readily available in drug stores throughout the country.

Robinson's "Patent" Barley

In use for over 30 years

Map 19. Deaths of physicians.

Map 20. Locations of physicians who have been licensed, 1921-30.

Map 21. Original homes of medical students who graduated, 1921-30.

Commenting on Map No. 3, Dr. Rice says:

"Map 3 is of interest particularly to one who is familiar with the state of Indiana. In every county (with the exception of Lake in the extreme northwestern corner next to Chicago) with a large urban population there are relatively many physicians. Lake county has a large foreign population and has been growing exceedingly rapidly. It has not as yet reached a state of equilibrium. Strictly rural communities have relatively few physicians."

The condition in Lake County, Indiana, is paralleled by that in Queens County, a borough of Greater New York, with a population of 1,079,000, an increase of 130 per cent in ten years. The physicians number 938, or one in each 1,140 of population. This is practically the same proportion that it was in 1925.

Dr. Rice writes:

"Map 5 is probably the most useful of the maps. In this we have made the attempt to arrive at a coefficient which would express the three factors which determine the supply of and demand for physicians if other conditions were the same:

"1. Population—the more people the more physicians will be needed. 2. The number of physicians in actual practice. 3. The life expectancy of a physician of the average for a given county as shown in Map 4. We have divided the population by the product of the number of physicians in practice times the average life expectancy and have obtained an abstract number which averages 38.9 for the entire state and as low as 20 for Marion county and as high as 250 for Brown county. Since many doctors retire years before they die it would have been better if we could have used the average expectancy in practice but there are no sources for such figures.

"Counties with high coefficients (shaded heavily) are evidently more in need of physicians than those with low (light shading). A young

(Continued on page 635—Adv. xiii)

(Continued from page 634—Adv. vii)

man seeking a place to practice would seek one of the darker counties provided economic conditions, roads, and general culture were such as would make such counties attractive. It is evident that the counties with cities are relatively well supplied or even over-supplied.

"Map 10 shows the total wealth of the county divided by the number of physicians. In some communities the physicians can draw on more than two and one-half millions while in others he would be in contact with less than one million dollars worth of property. By comparison with Map 9 we see that physicians tend to be more numerous where there is money.

"Map 17 gives the number of physicians in the county (denominator of the fraction), the number who belong to the local medical society (numerator of the fraction) and the percentage of all who belong."

The distance that a patient would have to go to secure a doctor is frequently discussed in New York State. Discussing this point, Dr. Rice says:

"Much has been said about the supposed fact that many communities cannot get a doctor because of distance. This is hardly true of Indiana. Map 18, page 632, was made by drawing a circle representing 7.5 miles about each town that had a doctor. Those places more than 7.5 miles are shown shaded black. All of the larger black spots are settled sparsely. With good roads, automobiles and telephones to hasten the service it seems as if there is nothing to worry about in Indiana on this score. An attempt to make a map showing telephones was made, but it was found that practically every community in the state was within a mile or two of a phone and so the map did not seem very significant."

Dr. Rice enumerates the following conclusions:

"The following conclusions seem rather apparent:

"1. The distribution of physicians is influenced by the distribution of wealth.

"2. The younger physicians are going to the cities rather than to the rural districts.

"3. Few communities in Indiana are now in great need of physicians.

"4. At present rates—if they should continue—many counties in southern Indiana will in ten or fifteen years be dangerously in need of physicians.

"5. Modern industrial centers are producing few physicians but are attracting many; rural and small town districts are producing many physicians but cannot hold them after they have graduated.

"6. Matters pertaining to the distribution of physicians are capable of being analyzed and it is not unlikely that unequal distribution can be corrected in large measure by the publication of data such as the above."

Increases food value of milk more than 70%

*and changes it into a delicious
chocolate flavor drink*

THE addition of Cocomalt to milk produces a high-caloric, easily digested food drink—palatable even to the fussiest invalid.

It is valuable post-operatively and during convalescence, because it provides *extra nourishment* without burdening the weakened system.

It is especially helpful for undernourished, underweight children—because each glass is equal to almost two glasses of plain milk.

Cocomalt is a scientific combination of milk proteins, milk minerals, eggs, sugar, converted cocoa and barley malt. It contains Vitamin D in sufficient quantity to make a definite contribution to the antirachitic potency of the diet.

Because it provides a lot of substantial nourishment at little cost, because it is quickly assimilated, and because it is *delicious*—Cocomalt is recommended as a diet supplement to increase strength and restore vitality. It comes in ½-lb. and 1-lb. sizes, at grocers and leading drug stores. Available also in special 5-lb. can for hospital use.

Colloidal Bi-Na-Gluconate

(Bismuth Sodium Gluconate Colloidal)

The introduction of medicinal colloids has been regarded as a notable advance in chemistry. Their efficacy depends upon the extreme minuteness and dispersion of their particles

"A colloidal suspension affords relatively to the mass of drug employed, an enormous surface area for contact between tissues and remedy, and at the same time supplies to the system a depot of medicament from which slow, constant and progressive absorption in the form of true colloidal solution may take place." (R W M-Kenna, *British Medical Journal* 2 745 1920)

Bi-Na Gluconate (bismuth sodium gluconate) in true colloidal state is an ideal soluble bismuth solution for intragluteal injection in Syphilis. It is suited to the most rigid requirements of the syphilologist and physician, contributing to the comfort of the patient, safeguarding both physician and patient. It eliminates many trying problems associated with various phases of syphilotherapy. It is stable. It is uniform.

Bi-Na Gluconate is characteristic of metallic colloids—rapid absorption, without irritation and toxicity, slow elimination without undue action upon the kidneys, permitting proper bismuth storage within the system to the limit of the patient's tolerance. Its stability and physicochemical structure are such that its spirochetaicidal action is powerful.

Each 2 cc of **Bi-Na Gluconate** contains bismuth sodium gluconate colloidal, $1\frac{1}{2}$ grains, representing metallic bismuth 25% or 25 Mgm with 2 per cent alcohol benzylc as a local anesthetic. Practically painless when injected $1\frac{1}{2}$ to 2 inches intragluteally. 10 to 15 injections constitute a course and are given weekly or semi-weekly. Minimum lethal dose is 125 to 150 times therapeutic dose.

SURVEY OF MEDICAL AGENCIES IN MICHIGAN

This Journal of December 1, 1931, page 1480, printed an abstract of a report of the action of the House of Delegates of the Michigan State Medical Society on September 22, 1931, that a committee study the lay health agencies of Michigan and report at a special meeting of the House of Delegates early in the year 1932. The meeting was held on January 22, and is reported in the March issue of the Journal of the Michigan State Medical Society. The Committee made a report of forty-five pages, but it was presented at an executive session and was not printed, even in abstract or summary, in the Journal. The Secretary stated that the Committee had not started its investigations, but it evidently had made extensive plans to study the thirty or more health organizations of the State. The statement was also made that the cost of the investigation would apparently be \$25,000, and that a large part of the money had been already promised, evidently from non-medical sources.

The tangible action of the House of Delegates was to vote to instruct the Committee to continue its investigations and report at the regular annual meeting of the House of Delegates in September.

The Committee on the Survey of Medical Agencies made the following recommendations which were adopted:

"1. That any physician becomes ineligible for membership or continuance of his membership if he associates himself with any group, clinic or hospital that provides medical care to an individual who is financially able to assume reasonable charges for his medical care and where such groups, clinics or hospitals do not permit its medical staff to determine the individual's eligibility for free service.

"2. That this House of Delegates transmit to the University Regents and to the Administration Committee of the University Medical School and Hospital its disapproval of any attempt or activity that has for its purpose the taking over, by medical faculty or staff members, the administration of any clinic or hospital in the State. That we protest the use of the University Hospital for the care of patients beyond the number required for teaching purposes.

"3. That each county society appoint a Public Relations Committee for the study, solution and adjustment of local problems in the distribution of medical service.

"4. That legal proceedings be instituted against corporations now practicing corporate medicine in an endeavor to terminate corporate practice."

COMMITTEE ON PUBLIC RELATIONS IN PENNSYLVANIA

The editorial department of the April number of the *Pennsylvania Medical Journal* contains the following letter, a copy of which was sent to the secretaries of the county societies of the State

"The Committee on Public Relations of your State Medical Society, at its organization meeting, December 8, decided that a proper knowledge of medical history is essential if a clearer understanding of the many-sided problem involved in the prevention and treatment of sickness is to be developed between the organized medical profession and the people of Pennsylvania

"We are publishing, therefore, for the benefit of the officers and members of your Society, an outline which includes a number of practical suggestions for not only the nucleus of a library on medical history, but also a series of proposed programs for meetings of your county society concerning possible scientific medical subjects and the history of the development of such subjects. These outlines, it is believed, will be found sufficiently elastic to meet the needs and the conditions of the individual societies, whether large or small"

The outline of study printed in the *Journal* was revised by Dr J D Heard, of Pittsburgh, who says in the introduction

"It is suggested that four papers be assigned to each meeting. The papers presented are of two types—(a) biographical, (b) scientific. (a) Biographical papers should be devoted to a discussion of the lives of men who have made great contributions to medicine. The lives and work of these men should be considered in relation with their background, namely of the general state of society and the degree of medical knowledge possessed by the profession at the time in which their work was done

"(b) The topics of the scientific papers should be suggested by the contributions of the men who are being considered biographically but should present the modern aspect of the subject discussed

"In preparing a program for a single meeting it would probably be advisable to include biographies of two men who had worked in a like field but at periods somewhat widely separated as to time. Examples of this method will be found in the accompanying outline. A variant which might increase the interest of the individual meeting would be to divide the program between a so-called fundamental and clinical branch. Thus, 'Vesalius' and 'The Treatment of Empyema' might be combined with papers on 'Laënnec' and 'Bronchiectasis' "

The outlines of study are presented on the following topics

1 Value of medical history, (a) Hippocrates,

(Continued on page 640—142 1 111)

THOUGHTS

ON THE PRESCRIBING OF DIGITALIS NO 2

"THE only sensible way to exhibit digitalis is to return to the method of Withering and, given a patient who is a proper subject for digitalis, to administer digitalis until the favorable result is obtained, then to maintain a sufficient dosage, to keep the patient in a comfortable equilibrium" *

Obviously it is of vital importance to the physician to know the strength of the digitalis he is using, and to be sure that every time the product is supplied on prescription it will be uniform in potency and clinical effect

The preference displayed for Upsher Smith Digitalis is based on its unusually dependable uniformity. This product is unique because it is grown under the personal supervision of Upsher Smith and his sons at Foxglove Farm, where the one crop is digitalis. Naturally this enables them to safeguard every step from the planting of the seed to the finished product

As a final safeguard of uniform potency, Upsher Smith Digitalis is not merely biologically assayed in terms of absolute cat units, but it is checked against the International Standard Digitalis Powder of the League of Nations. In this way the margin of error associated with biological assay is reduced to the minimum, and the dosage can be more easily determined, thus

- 1 International Unit = 2 grains USP Digitalis Powder
- 1 cc Tincture = 2 grains USP Digitalis Powder
- 1 International Unit Capsule = 2 grains USP Digitalis Powder
- ½ International Unit Tablet = 1 grain USP Digitalis Powder

Let us send you a supply of Upsher Smith
Digitalis for clinical test

Upsher Smith Co.

"4. Morbid Anatomy, (a) Morgagni and Virchow, (b) Leukemia.

"5. Bacteriology, (a) Pasteur and Koch, (b) Hydrophobia.

"6. Internal Medicine, (a) Laënnec and Osler, (b) Blood platelets.

"7. Surgery, (a) Pare and Lister, (b) Flies, or local sepsis.

"8. Neurology, (a) Charcot or Mitchell, (b) Nerve injuries.

"9. Obstetrics, (a) Simpson and Semmelweis, (b) Anesthesia or sepsis.

"10. Gynecology, (a) Sims and McDowell, (b) Ovariectomy."

An extensive list of reference books completes the report.

CORONERS' CASES IN MAINE

The leading editorial in the January issue of the *Maine Medical Journal* discusses the need of administrative machinery for determining the cases of death in what are called "Coroners' Cases" in New York, and says:

"The laws of Maine governing the disposition of dead bodies and procedure in the matter of investigation, cause and manner of death are perhaps adequate; certainly they are better than those that obtain in many modern states both in this and other lands. Our practice under the law falls far short of guaranteeing that degree of protection to society which a modern state should have.

"If it is of importance to determine the exact cause of death in the case of persons found dead in order to determine the manner of death, whether suicidal or accidental, criminal or otherwise, or the result of foul play, no effort should be spared to answer this question i.e., exact cause of death in the most authoritative way.

"Here lies the weakness of our procedure. The doctor must answer this question, but the average doctor is not, and never will be, qualified to solve the problem when the solution must so often depend upon the findings of a complete autopsy checked by the pathologist, toxicologist, chemist and other specialists. The sole source of authoritative opinion and decisions, including reliable interpretations of autopsy findings, today is the well-equipped pathological department of the modern hospital.

TRADE-MARK

PYRIDIDIUM

Phenylazo-Alpha-Alpha-Diamino Pyridine Mono-Hydrochloride (Mfd. by The Pyridium Corp.)

FOR URINARY INFECTIONS...

An effective germicide used extensively in the treatment of genito-urinary infections. The oral administration of Pyridium in tablet form affords a quick and convenient method of obtaining bactericidal action when treating Gonorrhea, Prostatitis, Pyelitis of Pregnancy, Pyelitis in infants and children, Cystitis and other chronic or acute urinary infections. In therapeutic doses Pyridium is non-toxic and non-irritating. It rapidly penetrates denuded surfaces and mucous membranes and is quickly eliminated through the urinary tract. The Council on Pharmacy and Chemistry of the American Medical Association has accepted Pyridium for inclusion in New and Non-Official Remedies. You can therefore prescribe this drug with full confidence that its therapeutic action will conform to the claims made for it. Avoid substitutes. Your prescription pharmacist can supply Pyridium in four convenient forms: as tablets, powder, solution or ointment.

(Continued from page 640—Adv. xvi)

"The first and most important step to improve the situation in Maine is to recognize this undoubted fact. In Portland, Lewiston some encouragement and support from the profession and the State Health and Welfare and Bangor are general hospitals, which, with Department, might so develop their already efficient pathological departments as to soon bring about this first important step at a miniature as centers where all autopsies and special examinations involving medico-legal questions might be performed. Proper cooperative effort of the medical and legal professions and the Department of Health and Welfare could mean of cost, for no new agencies are needed to effect some such arrangement.

"We feel confident that the medical profession of Maine might be of far greater service to the state and to the legal profession in solving some of the questions which arise when a dead body is found."

MALPRACTICE DEFENSE IN MICHIGAN

The April issue of the Journal of the Michigan State Medical Society discusses malpractice defense, as follows:

"Last year was one of the severest in the history of the Michigan State Medical Society in the cost of medical defense. Nothing but a full paid-up membership in County and State Society will enable the State Medical Society to meet the exigencies of such a situation should it prevail during 1932. For the monthly expense of defending malpractice cases during 1931, see page 160, February Journal of the Michigan State Medical Society.

"If fire insurance premiums were permitted to lapse even a day, the policyholder would be a heavy loser in the event of a conflagration. A malpractice suit may eventuate in greater loss than that occasioned by a fire.

"Hitherto, the State Medical Society has carried many delinquent members. It is no longer able to do so. As a result a member's name on the list of delinquents will mean that he forfeits the right to protection if threatened with a suit for malpractice.

"Membership in county and state medical society and American Medical Association is as much a necessity to the practicing physician as an automobile and office equipment. It should be looked upon as important a 'fixed expense' as either of the necessities mentioned. Prudence demands that it be so considered. No one should deny himself the benefit of such protection from the day he begins practice until that time when age or other factors compel him to retire. Even if one must resign from organizations, fraternal or social, do so, but maintain a live connection with the county medical society."

PREScribe KNOX SPARKLING GELATINE IN DIETS FOR DIABETES LIQUID and SOFT FEEDING REDUCING and ANEMIA

KNOX is pure, granulated plain gelatine with 85-86% protein content. Free from flavoring, coloring or sweetening—therefore combines safely and perfectly with fruits, vegetables and other foods for all diets.

VICHY CELESINS

The American Agency of French Vichy, Inc., sole American agents of "Vichy Célestins" water bottled at the Spring at Vichy, France, owned by the French Government. There are other Springs at Vichy also owned by the French Government such as Grande

Grille and Hôpital which are imported by these Agents but these are not sent here in as large quantities as the "Vichy Célestins." This Agency also imports the Vichy Salts and Vichy Pastilles which are called Products of Vichy-Etat because they are made from the Salts extracted from the waters of these government-owned Springs. The Exhibit at booth No. 8—Annual Meeting, Buffalo—will consist of these goods and of photographs of the scientifically equipped therapeutic establishments at Vichy to which the Medical Profession of the United States annually sends many patients for the treatment of diseases of the stomach, liver, etc.—See page x—Adv.

GOLF, AND INFANT FEEDING

It is possible to play over the entire course with a single club and bring in a fair score. But playing with only one club is a handicap. The best scores are made when the player carefully studies each shot, determining in advance how he is going to make it, then selects from his bag the particular club best adapted to execute that shot.

For many years, Mead Johnson & Company have offered "matched clubs," so to speak, best adapted to meet the individual requirements of the individual baby.

We believe this a more intelligent and

helpful service than to attempt to make one "baby food" to which the baby must be adapted. See page xxiv—Adv.

WHAT IS MALTCOA?

Maltco is a scientifically prepared health food consisting of pure sugar, malt, cocoa, partially defatted milk, and liberal quantities of organic phosphates of calcium and iron in the same form as nature produces these salts in grains and vegetables.

"MALTCOA" ANALYSIS:

Moisture	3.03%
Cocoa Butter	4.42%
Butter Fat56%
Milk Solids not Fat	10.69%
Crude Fiber89%
Cane Sugar	45.07%
Maltose	14.72%
Total Protein	9.87%
Dextrin and Other Carbo- hydrates	7.36%
Mineral Ash	3.99%
	100.00%

The ash contains:

Sodium Chloride	0.84%
Iron	0.09%
Calcium Oxide	0.52%
Phosphates as P ₂ O ₅	1.41%
Calories per Pound:	1830

See page xiv.—Adv.

SOCIAL AND ECONOMIC PROBLEMS FACING THE MEDICAL PROFESSION*

By NATHAN B. VAN ETEN, M.D., NEW YORK, N. Y.

THE five year study of the Committee on the Costs of Medical Care has resulted in the collection of authoritative data concerning the health of the people of the United States, their social attitude toward medical service—their ability to pay for medical service—environmental and industrial conditions contributing to illness—and the extent of illness through every life period from birth to burial.

The committee has eagerly sought the truth—making every effort to lay aside prejudice, preconceived ideas and premature conclusions until the real facts could be carefully and honestly weighed and their implications interpreted.

It is remarkable that no one of this large committee of fifty mature people has attempted to dominate the thought of the committee or tried to prove a theory—or tried to set up an ideal.

Viewing the problem from many angles the committee has tried to verify and appraise the enormous amount of factual data collected by the research staff—and nearing the end of the committee's life—has not yet decided upon a concrete plan or specific recommendations.

The science of medicine has developed so much more rapidly than the art and the application of medicine and the struggle of the medical profession to keep up with modern scientific thought is so absorbing that the business of medicine has lagged behind and an impression has been created that physicians are indifferent to the economic problems which surround them.

It is true that reactionaries have dug their heels deeply into the soil of tradition and have resisted modern change with every conservative argument with an intense desire to preserve the sanctity of the guild and the continuance of individualism—and that there are those who cannot be aroused to interest themselves in legislative activity either in the interest of

the public health or the protection of themselves against the inroads of cults and sub-standard practitioners—but it is also quite evident that there is an active nation-wide desire for our final report with the hope that it will contain or inspire some new program of medical service.

Physicians practicing in the last half of the 19th Century were still real individualists holding outstanding leadership in their communities—highly respected—consultants on every problem of family life—receiving small fees or no fees or fees in kind, such as chickens, eggs or potatoes—and suffering little competition from specialists. They gave much less thought to the economics of medicine than to intensive interest in rendering the best possible service to the sick.

The code of ethics concerning professional relations with homeopaths—eclectics and physio-medicalists caused sharp division between old code men and new code men but there was very little then of the wide spread of education by the cults and organized groups of irregulars, which has recently grown so rapidly.

Charlatanism and quackery have walked step by step with the development of medical service through the ages, but organized group infringements upon the medical field have assumed hitherto unknown proportions during the last thirty years.

The changing order has been slowly gaining momentum during these years attaining such speed that we now are fearful lest the whole social machine may jump the track.

Whither medicine no one really knows—but it promises to become less individualistic and possibly increasingly dominated by governmental influence. We have 145,000 physicians in the United States, most of whom are educationally well qualified, 100,000 of them members of the American Medical Association. Opposed to them are 36,000 other individuals of lesser education, who hold themselves out and loudly

* Read at a special meeting of the New York Academy of Medicine on March 9, 1932.

advertise themselves as competent to minister to the sick.

7,600 Osteopaths who take \$42,000,000 annually for their services.

16,000 Chiropractors who take \$63,000,000.

2,500 Naturopaths and the like who get \$10,000,000 and 10,000 Christian Scientists and other religious healers who take another \$10,000,000. A total of \$125,000,000—for irregular practitioners—all of whom have grown up in the last 30 years, and all flourishing because a gullible public has been attracted by the advertising of their panaceas—and because they were offering something which the medical profession not only would not lay claim to but also was too indifferent even to protest against.

There is justification for claiming that the medical profession has some responsibility for the growth of these groups because it paid too little attention to massage—too little attention to mental ills and neglected psychotherapy—but I believe that the success of all of these movements to enter the practice of medicine by back doors and short cuts may be measured by the quality and quantity of their publicity.

Most of the commercial advertising is faulty through misrepresentation and through placing therapeutics ahead of diagnosis—while on the other hand some of it also has indirect value.

The nation has become introspective through the widespread story of halitosis. Amos and Andy have been a wonderful asset to the dentist—and the advertising of the Life Extension Institute is helping those practicing physicians who have been wise enough to make thorough physical examinations of their own patients.

While the conservative ethics and traditions of our profession are timidly restraining greatly needed educational group advertising by honest and conscientious physicians—at the same time a great tidal wave of health education is now sweeping the country, a review of which should reveal to the medical profession a great opportunity to broadcast the real values of scientific knowledge for the benefit of our people.

The Twentieth Century is staging a most remarkable development of public consciousness of the vital importance of individual and community health.

The dramatic accomplishments in sanitation and disease prevention of Gorgas at Panama—of Reed and Carroll in Yellow Fever—of Biggs in Tuberculosis and Park in Diphtheria have stimulated socially minded people to attempt practical application of the discoveries and demonstrations of these devoted scientists.

The dictum that "Public Health is Purchasable" and that "Any community may within certain limits determine its death rate" has through continued reiteration been accepted

not only as basic fact but also as an ultimate goal.

The medical profession cherishes the ideal of lower mortality and lower morbidity as its highest possible accomplishment.

The new group of four thousand young practitioners coming annually into the field of medicine, possessing an average required educational equipment unequaled in any other profession—brings fresh enthusiasm to this task.

Factfinding committees composed of physicians, educators and public-health workers, philanthropists, governmental leaders, publicists, industrialists, religious organizations, clubs which meet at luncheon—Red Cross Workers, National—State—County and Local Tuberculosis and Public Health Associations—the cancer group—the cardiac group—the Physical Education group, are all seeking basic facts and practical methods for the promotion of happiness and prosperity through public health.

The avocational interest of all of these groups engaged in Public Health activities is of incalculable value—but would be multiplied if there were no embarrassments engendered by rivalry over prestige. No solicitation stimulated by sentimental devotion to special problems—no surprise programs announced without the knowledge of all co-workers and their agreement as to principle and general plan—no invasion without consent of the professional field of those whose vocations might be disturbed—no division caused by creed or class—no duplication of effort or over-lapping of functions.

While unofficial agencies must labor within prescribed legal limits, and no measures should be employed which would dampen the God-given enthusiasm of the volunteer, some co-ordinating machinery should be erected which would develop the highest possible type of teamwork among us all and under central direction eliminate friction and waste.

For all of our troubles general education seems to be the most promising remedy.

If public health is purchasable—every taxpayer should be educated as to its economy—its needs and its profit to the community.

If we are to have lessened loss to industry through sickness—both employer and employee must be educated in the economics of disease prevention.

If we are to have healthier family life we must teach the dangers of contact with communicable disease. We must teach pre-natal-intra-natal and post-natal care and the careful conservation of the health of that most important individual the mother of the family.

If we are to continue our successful work

in Tuberculosis we not only must employ case-finding agencies to discover incipients and refer them to physicians—but also to follow up contacts in the family with education in better living conditions and personal care.

If we are to reduce cancer mortality we must teach all people the necessity of early examination by competent physicians.

If we are to diminish the loss to society through crippled hearts and other organic dysfunctions we must advocate annual birthday physical examinations and we must impress upon all physicians the importance of doing this work thoroughly.

Specialization has apparently overgrown reasonable bounds because of too many recruits with too little background of fundamental medical knowledge and too little real education in their limited fields.

It is my personal belief that the multiplication of specialists has been a potent cause of breaking down the bonds of confidential responsibility between patient and physician and whatever truth there may be in alleged instances of medical services at exorbitant cost—is safely chargeable to pseudo-specialists of low character or low scientific attainments—or both.

Much could be done to correct this situation by careful selection of medical students for character qualification as well as for basic educational attainment and also by curricular changes which would emphasize the importance of the development of clinicians.

Special certification should be required for those who would practice specialties to be given only after a legally required period in general service.

Physicians are the servants of the sick and the sick must be guaranteed good servants. Physicians are the poorly paid servants of the sick. Their sick employers are traditionally improvident—taking no account of tomorrow's need through accident, or infection, or family increase, or the decadence of age. The state requires a most expensive educational equipment for the privilege of serving the sick but in no way protects that educated servant.

The municipality offers elaborate hospitality to the sick free or at less than maintenance costs but makes no provision for remuneration of the medical servant.

The sick employer, with no thought of paying, quite consciously demands that his medical servant maintain an expensive front, keep an office well equipped with such machinery as is maintained in large institutions.

The romance of medicine has developed a body of traditional idealism that continues to influence physicians to live improvidently with an unparalleled selflessness that spells economic incompetence.

Because we have always done so is no satisfactory reason for continuing to carry the financial burden of the unbudgeted sick.

We must realize that the business of medicine must be modernized to support the life of the science of medicine and that if physicians would be leaders in medical care they must know the real conditions that surround it. We must be alive to all of the facts concerning sickness in the United States if we shall be able to give the best service to the sick with a proper appreciation of its value and a sane demand for appropriate remuneration.

Industry is attempting to reduce waste through sickness by trying experiments that range all the way from emergency dressing stations to full-time care of the worker and his family. As many as 2,000,000 people in this country receive all or part of their medical service through so-called industrial medical service.

Among many experiments in medical service are one hundred and fifty private group clinics—located mostly in the Middle West and employing an average of twelve physicians in each clinic.

The sharing of facilities for diagnosis and therapy and the grouping of physicians' offices lowers the overhead—eliminates waste of time used in traveling from one specialist to another—and permits lower charges to the patient who receives one bill for medical services.

Fifty-five of these clinics have been described and analyzed with fine clarity in a hundred-page publication by C. Rufus Rorem, Ph.D., C.P.A., and may be profitably studied by all physicians.

A lay manager usually conducts all of the financial matters and the physicians are on yearly salaries. The average net income of 301 doctors in 27 clinics was \$9,747.00 in 1929.

Besides the financial advantage to the physicians of the clinic who have partnership relations—constant consultation contact seems to promote a desire to practice good medicine which is highly appreciated by the patient.

The question may be raised—is the patient better served by the group than by the individual?

Does the divided responsibility of the group satisfactorily replace the confidential interest of the personal physician?

The patient usually starts with an internist or with a physician personally known to him and is then referred to specialists and finally returns to the first physician who analyzes all of the findings and then if necessary refers him to the appropriate physician or surgeon.

If the confidential man to man interest is not possible it is believed that the consultation

value of the group is sufficient compensation for it.

So long as the group clinic avoids the temptations of cheap contract practices, such as are described by Dr. R. G. Leland in the March 5th number of the *Journal of the American Medical Association*—they may be conducted on a high moral and scientific plane and may furnish inspiration for many groupings of physicians especially if integrated by general practitioners.

The "Costs of Medical Care" is a title which immediately stimulates a defensive reaction in the minds of physicians who visualize a reproach upon the honor of the profession and fear an attack upon their incomes.

The "High Costs of Medical Care" as many quote it, carries inferential insult to the man who knows from his personal experience that most of his colleagues like himself give away much of their time to free or inadequately paid service to the indigent—to the hand-to-mouth citizen and to the family of moderate means.

The physician who dissects his gross income and realizes that thirty-six to forty-eight cents of every dollar that he collects goes for overhead—may well believe in the high cost of the medical service which he is giving and that the high cost must be credited to the donor and not to the recipient of medical service.

17 cents out of every dollar for office expense.
10 cents for automobile maintenance and equipment.
6 cents for drugs and supplies.
3 cents for assistants.
8 cents for nurses and office help.
4 cents for miscellaneous expenses.

The fact that, of the ninety billions of our total national income in 1929, only three billion four hundred thousand dollars went to pay the health bill—that physicians got less than one third of that—and that in that same year one billion eight hundred million dollars was spent for tobacco alone is comparative evidence that our people are not in any manner rating health above luxury.

The facts disclosed by the committee's research showing—that every man, woman, and child in the United States averages a loss of seven days a year because of sickness, much of which is preventable—that one hundred and twenty thousand infants under one year of age die every year from theoretically preventable diseases—that each year thirty thousand young men and women between the ages of twenty-five and twenty-nine die from entirely preventable causes—that three hundred thousand births or fifteen per cent of the entire number of births last year were attended by fifty thou-

sand midwives, most of them untrained—ignorant—superstitious and dirty—that eighty-eight thousand three hundred and fifty-two people died from tuberculosis, and sixteen thousand one hundred and eighty-eight from syphilis in 1929, many of these deaths preventable by early detection and adequate care—that seven thousand deaths from diphtheria occurred last year, all preventable—that there were five thousand seven hundred deaths from typhoid fever, most of them preventable, thousands of cases of smallpox, with one hundred and fifty-one deaths—all preventable—four thousand deaths from malaria—all preventable, and when we discover that only twenty-two per cent of our children have been vaccinated against smallpox—and add to this the unfortunate waste of five hundred million dollars for patent medicines and self-medication—with one hundred twenty-five millions for Osteopaths, Chiropractors, Christian Science and other healers—and when we realize that none of this is due to deficiency of medical technology but from deficiencies in economic organization—then we are forced to admit the inadequacy of medical care and that the lack of medical care is costly indeed.

The general practitioner in the country is a real individualist—he has everything to do and on the whole does it well through the necessity of highly developing and actively using his five senses.

But the general practitioner in the city without hospital connection is seriously handicapped unless he makes a specialist of himself by excluding the types of work which demand expensive appliances and concentrates his study upon pure internal medicine calling upon specializing colleagues for needed help—integrating them into group service of his patients by the slender ties of consultation or by going into the physical grouping of a professional—building and sharing the overhead of office and laboratory expenses.

It seems inevitable that organized medicine will attempt to improve the income position of physicians who fall below the levels of professional dignity by attempting re-distribution or by limiting the new entrants into medical practice—or by setting up health districts surrounding new small general hospitals or existing hospitals where all of the reputable physicians in the district might be able to attend their own patients or at least to enjoy the use of hospital facilities.

It would be interesting to study plans to furnish adequate medical service to a county unit—which should include intensive preventive measures—by health education carried to every family—by complete physical examination and immunization of every pre-school

child—by the discovery and protection of every contact with communicable disease—by the institution of general periodic health examinations and by the free use of hospital facilities by every physician.

Although the insurance principle may be invoked to provide payment for medical service, the most immediate prospect seems to be the evolution of workmen's compensation laws now operating in 46 states. It seems to promise an ever-widening prospect for the inclusion of all occupational diseases—and other non-occupational diseases occurring during employment, and also the extension of medical care to the dependents of employees—through insurance provisions.

It seems unlikely that any considerable number of our people will budget sickness through the medium of voluntary insurance or through any other voluntary system. Nor is it likely that any of the present European schemes of compulsory health insurance will find nationwide endorsement. But it is evident that close scrutiny must be given to all legislative proposals and that county, state and national medical organizations must be aroused not merely to correct exploitation of physicians, but to develop constructive medical statesmanship.

I have not the slightest desire to prescribe a formula, but I believe that the average net incomes of physicians and the general satisfaction of the people of this country would be greatly improved by close organization and intensive development of all health elements under active medical leadership—with constant unremitting publicity of the real facts, accomplishments and aspirations of modern medicine.

The Committee on the Costs of Medical Care has no panacea for the economic wastes of sickness—but it is to be hoped that its collective data will of themselves compel solutions which will promote sound advances in intelligent service to all classes of people and maintain high moral and material standards for the medical profession.

The Committee will hold an advisory conference in Washington in June with experts in group thinking—in education and in public health. It will hold a two-day discussion of the final report and the analyses of the collected data. After this has been done, the report will be finished and presented to the country at the end of November, 1932—and the committee will have finished an unprecedented piece of research work into the health of the nation.

A STUDY IN FAMILIAL ACHYLIA GASTRICA, WITH COLLATERAL OBSERVATIONS ON ITS RELATIONS TO GASTRIC CANCER AND PERNICIOUS ANEMIA*

By MEYER GOLOB, M.D., NEW YORK, N. Y.

THIS study in familial achylia comprises a group of two brothers, a sister, and a half-brother born of a different mother. Both the sister and half-brother died of gastric cancer, the former at the age of 40 and the latter at 31. In both cases, the stomach contents revealed all the stigmata of achylia. The other two brothers are living. It is interesting to note that there was another sister in the family who died of diabetes mellitus at 40, and yet another sister, still alive, having the same disease.

I have delayed the publication of these cases in the hope of obtaining fuller histories of the other members of the family, but my efforts having failed in this respect, it seems to me advisable to put on record what data I have, making them available to other clinicians who may introspect this phase of achylia gastrica when occasion offers.

In presenting these cases, I will touch only upon their outstanding features for our discussion.

Case I. (♂) Male, age 31. The history of the presenting symptomatology was short and referable mainly to the digestive apparatus. Prior thereto, the patient had not suffered from stomach disorders and enjoyed good health generally. The physical findings were essentially negative. There was a roentgen filling defect of a part of the pars media and entire pars pylorica, but no corresponding palpable mass. The pylorus was gaping, as was evidenced by immediate gastric emptying. The blood Wassermann was negative. The stomach chemistry revealed a definite achylia.

Dr. Howard Lilienthal, who operated on the patient, reported that examination under anesthesia failed to disclose any mass or abdominal resistance, but this may have been due to the sthenic build of the patient, wherein the stomach is generally high in position, and therefore not readily accessible to palpation.

The operative findings were: "The whole posterior wall of the stomach formed one stiff mass of carcinoma. A nodule removed from the omentum showed a metastatic colloid car-

* Read before the Eastern Medical Society, October 9, 1931.

cinoma." The patient died several months later.

Case II. Female, aged 40, multipara. The presenting symptomatology was of three months' duration, and emphasized mainly a disordered digestive apparatus, weight loss and asthenia.

The physical examination evidenced the loss of weight, and revealed a frank mass in the upper left abdominal quadrant, irregular in outline and tender to touch. The stomach chemistry showed a definite achylia with a positive Wolff-Junghans test. The roentgen findings were: a minus filling defect in the prepyloric region, absence of peristalsis over the defect, pyloric patency, rigidity, distortion of the rugæ, and contraction in the size of the stomach. Dr. A. A. Berg did a total gastrectomy and esophago-duodenostomy. The patient died ten days later.

One may note here the striking similarity between the two cases, which differed only in the post-operative duration of life because of the conservative surgery in the first case and the heroic surgery in the second.

Case III. Male, aged 40, under observation since 1923. The presenting symptomatology was of 12 years' duration, mainly of an intestinal disorder, consisting of attacks of diarrhea alternating with constipation. The diarrheal evacuations were often accompanied by blood and mucus. The stomach chemistry established a gastrogenous etiology for his diarrhea, for repeated tests showed a definite achylia. Blood Wassermann was negative. Roentgenologic findings of the gastroenteric tract were essentially negative.

Continuous HCl administration and proper diet constitute a preventive therapy of this patient's intestinal dysfunction. His weight has increased from 120 to 140 pounds and there is evident a general constitutional expression of health.

Case IV. Male, aged 47. This case presented a very short history of the onset of symptoms, which were in the main a fatigue saturation syndrome, digestive aberration, anorexia and loss in weight. The physical findings were essentially negative, except for weight loss. The stomach analysis, on repeated tests, disclosed a definite anacidity. The roentgen investigation of the gastroenteric tract revealed no evidence of a lesion.

HCl therapy brought an arrest of symptoms and a clinical amelioration.

Discussion

In addition to their familial aspects, the cases under review demonstrate the value of a routine examination of the gastric chemistry

on a par with other secretions and excretions of the body economy. The cases of the two brothers who are living and well are fine examples of the value of preventive therapy; in sharp contrast to those of the two who died, give us a vivid suggestion of an ominous relationship between a chronic achylia and a gastric cancer.

The fact that achylia has been found consistent with good health does not preclude recourse to rational preventive medicine. In the absence of symptoms in a patient having an achlorhydria must be taken, at best, to imply the functioning of a defensive compensatory mechanism, maintained provisionally by the auxiliary organs of digestion—pancreas, succus entericus and bile.

The effect of such auxiliary activity, if prolonged, may be visualized from the following table of sequences:

- Irritability, exogenous, etiology.
- Hyperfunction.
- Chronic Gastritis.
- Hypofunction.
- Achlorhydria.
- Compensatory mechanism in action.
- No symptomatology.
- Fatigue, exhaustion of defense mechanism.
- Stormy symptomatology.

We can see here what achylia, undiscovered, may do to a patient, and what preventive therapy may do for him. It is logical to expect that overstimulation of the compensatory mechanism will lead to its exhaustion. Fatigue is responsive to rest, hyperfunction may be abated, but degeneration of the gastric mucosa is irrevocable.

To prevent fatigue of the accessory organs of digestion, HCl is the therapy of import, for HCl is nature's method of defense, designed to prevent micro-organisms in the mouth and throat from passing into the intestines without being digested by the gastric juice. Whereas the stomach and upper small intestine are, in normal individuals, practically free from pathogenic micro-organisms in cases of gastric anacidity, infective bacteria from above, and ascension of disease bacteria from below render the gastro duodenal flora similar to those found in the lower ileum or colon. Their loci of infection, while centering mainly about the points of lesser resistance, are largely fortuitous. The attack in one case may be in the nerve tissue, in another, in the homopoietic organs, and still another the attack is entirely local. Thus, we may have from a common source, a nerve lesion, a blood disturbance, or gastritis and its sequelæ. Opportune administration of HCl may serve to check this bacterial activity and, at the same time, afford

needed rest to an overworked compensatory mechanism, but undue delay may bring complete bankruptcy, where no remedy may avail. It is, therefore, prudent to regard every person having an achylia as potentially a case of a graver malady.

An editor in the *Journal of the Am Med Assn*² states that "specimens that are removed for examination are likely to show quite wide variations in acidity, ranging from almost complete absence of free HCl to a content approaching 0.4 to 0.5 per cent."

This wide variability as well as the occasional finding of an almost total absence of "free" HCl, may be entirely consistent with good health, yet there have been those who saw in this paradox good reason for belittling the diagnostic efficacy of gastric analysis. But that is because they have been unmindful of the physiological fundamentals in normal digestion that engender such fluctuations in acid content. I refer to such buffer agents concerned in lowering the acid values, as food-stuffs, alkaline saliva, mucus, regurgitated bile, and the combining effect of proteins on HCl output.

This phenomenon of the "self regulation" of gastric juice has been definitely observed by medical authorities, notably by Boldyreff³ and by McCann⁴ of the Mayo Clinic. Their interesting explanations, however, are beyond the scope of this discussion.

It is not the occasional lack, but the persistent lack of acidity upon which we postulate our findings of achylia. It is when we have found the absence of free HCl to be characteristic, that we begin to look for its actual causes and its possible consequences. We then endeavor to establish the type of the achylia, and are minded in our search, of gastric cancer, pernicious anemia, gastric syphilis, tuberculosis. An array of laboratory activities will begin and a process of elimination will detect the offending agent. There will be a roentgen investigation to rule out gastric malignancy, a blood cytology to detect pernicious anemia, a chest roentgenoscopy to introspect the lungs, a serologic study to eliminate spirocheta pallida.

In short, a persistent achylia must be regarded as a warning signal to watch out for danger ahead! If there be no other symptoms, the achylia is a disease, the treatment is preventive; as an element of a syndrome, the achylia assumes an added importance as a symptom of a more formidable disease than achylia and the treatment must be curative.

Many observers have noted the affinity between achylia and other graver diseases. McLester⁵ speaks of a "symptom complex that is exhibited with striking uniformity by an

apparently heterogeneous group of diseases" and that "achlorhydria is the one salient feature in the symptom complex and signalizes the group" and that "in pernicious anemia it is by long odds the most characteristic as well as the earliest symptom." Eusterman found that "about 85% of gastric syphilis is associated with achlorhydria." Douglass Vanderhoof⁶ discussing the "etiologic relation of achylia to combined spinal sclerosis with no evidence of pernicious anemia," states that "HCl therapy brought remarkable results." It is hard to associate combined spinal sclerosis with achylia, but digression from one's own field of specialty often leads to the right path of therapy. Vanderhoof found that one third of the patients having combined spinal sclerosis have also pernicious anemia. Evidently the failure to note this association is due to the fact that this disease has been investigated by neurologists, while the spinal changes in pernicious anemia have been studied by clinicians. Thus, we may see that the single finding of achylia, categorically well oriented, does not permit the wary physician to think of but one malady.

Because of this broad kinship between achylia and other diseases, differential tests designed to determine whether its etiology is benign or malignant, or whether the acid secreting glands are alive or dead, assume a great importance from a diagnostic viewpoint. For this purpose, the injection of histamine has been found very effective, for it is a very powerful stimulant of HCl and the failure of this secretion to augment in response, is indicative of glandular atrophy or destruction—the probabilities favoring an organic lesion. The Wolff-Junghans test for dissolved albumen in the stomach contents have likewise been found positive in a goodly number of cases of gastric carcinoma. Another satisfactory device is available in the Rehffuss test by fractional analysis, which experience has demonstrated to be conclusively effective in establishing evidence of anacidity. Especially is this test (Rehffuss) convincing when reinforced with the histamine and the Wolff-Junghans test. The protein curve in benign achylia remains low and follows closely the acid curve, whereas, in malignant achylia the protein curve diverges quickly from the acid curve, signifying considerable albumen.

The consensus of opinion is, that practically all cases of pernicious anemia are accompanied by achlorhydria. Gmker asserts that the criteria upon which a true achlorhydria in pernicious anemia may be based are: 1 A non-protean behavior of the stomach chemistry. 2 Uninfluenced by remissions of the disease. 3 Constancy in anacidity contrasting with

ascendency in hemoglobin. Of course, formes frustes cases of pernicious anemia without achlorhydria also occur. Just as atypical is a case of pernicious anemia without cytologic evidence of the anemia but with dominating manifestations of cord degeneration-neurotoxin in activity with hemolytic toxin in abeyance. True achlorhydria in its relation to gastric cancer is not a constant association. My private records show that out of thirty-eight cases of gastric cancer, thirty-six had malignant achylia and two had free hydrochloric acid. Of these, one had free acid 20, total 40, occult blood 4 plus; the other had free acid 51, total 78, occult blood 4 plus. Both had unusually long histories. An autopsy in the first case disclosed a carcinoma at the base of the ulcer penetrating and involving the pancreas, with metastasis of the liver, spleen and mesentery. In the second case, the operation disclosed an extensive involvement of the pylorus and prepylorus region, with a pathological diagnosis of "adenocarcinoma of the stomach." Both cases illustrate the engrafting of malignancy upon the base of a gastric ulcer, thereby accounting for the apparent paradox of carcinoma in the presence of hyperchlorhydria.

It is worthy of mention that both pernicious anemia and cancer of the stomach have, in addition to achylia, another common symptom in atrophic glossitis. This condition may well be regarded as the mirror of the stomach in these maladies. It is an early symptom of pernicious anemia, and as it forms part and parcel of general gastro-intestinal atrophy, it is also indicative of gastric achylia. Thus the glazed tongue furnishes sharp differentiation between these maladies and the chronic dyspeptic conditions characterized by a heavily coated tongue or even an excessive number of papillæ with an abundance of HCl output by the gastric mucosa.

It has been questioned by Conner⁸ whether achylia precedes pernicious anemia or both conditions develop simultaneously. I am of the opinion that the achylia comes first, and, generally, by a substantial period of time. Conner writes that one patient in the Mayo Clinic had manifested symptoms of achlorhydria for twelve years, and one for eighteen years, before the symptoms of pernicious anemia developed.

It is most probable that achylia precedes cancer of the stomach, but not by such length of time as in the case of pernicious anemia. That irritation is the preceding state in malignancy may not be disputed. Tissue reposes until disturbed. To quote Bloodgood⁹ "Cancer never begins in a healthy spot." Mayo, Wm. J.¹⁰ maintained that "No one has yet seen cancer of the skin or mucous membrane of the

body which was not preceded by some form of irritation. Investigation of the body always reveals some condition preceding cancer." A stomach contracting 2,000 times in 24 hours without HCl to cope with the food intake furnishes, indeed, an unhealthy milieu for unruly cells to thrive. Surely it is rational thinking that achylia may be a precursor of malignancy.

There is a striking analogy between achylia in pernicious anemia and achylia in gastric cancer.

1. Anemia without achylia is not pernicious anemia. In carcinoma, achylia is the rule, but the converse also occurs, as when a cancer is grafted upon the base of an ulcer, however, even to this exception an exception may be cited, for a gastric ulcer might lead to a gastritis and the gastritis might induce an achylia, so that we would then have roentgenographic evidence of an ulcer and histopathology of malignancy with achylia. To quote Cheney: "To conclude, because free HCl is found, that the condition cannot be cancer of the stomach and to consider achlorhydria essential to the diagnosis is therefore a fatal error."

2. Achylia may precede pernicious anemia for many years, and is conducive to the anemia through a toxemia reaching the homopoietic organs.

Achylia may precede gastric cancer for many years, and is conducive to the cancer through establishing a locus minoris resistentiae.

3. Atrophic glossitis is often an early sign in pernicious anemia.

In gastric cancer, it is part of the gastric atrophy.

4. Histories showing familial achylia have developed pernicious anemia.

Histories showing familial achylia have also developed cancer of the stomach.

5. HCl is the ideal therapy in pernicious anemia.

In gastric cancer it is of secondary importance. Again, in cases, of apparently benign achylia, it is ideal.

There occurs to me a simple comparison which aptly illustrates the essential relationship between achylia and both pernicious anemia and gastric cancer. We are all familiar with the common practice of getting coal to burn by first building a wood fire, and starting the wood fire by igniting paper, which in turn is lighted with a match. It is the burning of each material that raises the temperature of the next until it, in turn, catches fire and burns. Here too, there is a start in one form or another, each condition inducing the next, until something catches fire and there is definite basic destruction.

Ewing¹¹ is of the opinion that heredity can-

not too indifferently be dismissed when considering the etiology of cancer. Napoleon's family is often cited in this connection. His father, mother, and two sisters are said to have died of gastric cancer, although Sir Bukley Moynihan is quoted as saying that Napoleon, himself, did not die of this disease. My own cases, reviewed at the beginning of this paper, are pertinent in this respect. I believe that a similar generalization may be made with regard to the hereditary aspect of achlorhydria. Rehfuss draws attention to some interesting family associations pointed out by Albu and notes that there were seven cases of achylia among twenty-four individuals descending from fourteen patients subject to pernicious anemia. McLester qualifies hereditary influences in his statement that "There are achlorhydria families in which some of the members, though handicapped by this defect, remain well, and others develop pernicious anemia. My own experience is in accord with this view. Just as, several members of one family may happen to have phthisical susceptibility, likewise several members in a family happen to have achylia, and both tendencies characterize themselves by a chronic gastritis and recurrent gastric upsets, thusly furthering the effect of a basic etiology of the glandular parynchema.

A case I recall is of interest because of the step down picture from a mere low normal secretion to subacidity, achlorhydria and achylia in a male patient whose father died of a parenteral condition, his stomach revealing an achylia many months before his death. One may certainly view this kinship with interest and hardly question, under such circumstances, the advisability of preventive acid therapy.

Conclusions

1. The cases reported in this paper illustrate the practical application of preventive therapy; they, undoubtedly, suggest that cancer respects no age, and the physician relying upon a "cancer age" indulges in a false sense of security.
2. The search for the etiology of a true achylia often leads to the diagnosis of a grave malady. It serves both as a danger signal and a path finder. Achylia is not merely a symptom of a disease, but either an anatomical part of a disease complex or a precursor of an oncoming malady.
3. The timely administration of HCl may check bacterial activity, and prevent the breakdown of the compensatory activities of the

auxiliary gastric mechanism. It is remarkably effective in gastrogenous diarrhea, pernicious anemia, combined spinal sclerosis and is the sine qua non in the therapy of benign achylia.

4. Pernicious anemia must be both preceded and accompanied by achylia, which may be regarded as one of its etiologic factors, thru its hemolytic toxin on the homopoietic organs, and neurotoxin on spinal cord structures.

5. Achylia is a potential forerunner of gastric cancer, laying a fertile soil for malignant implantation through irritation and lowered resistance.

6. Complete anacidity and a short history are strongly indicative of carcinoma; add to it the triad of anorexia, weight loss and progressive asthenia, and the diagnosis is certain. X-ray is only to tell us the extent of the region involved.

7. On the other hand, a long history of digestive aberration with even a hyperacidity does not preclude malignancy, but if there is the same triad syndrome, a diagnosis of cancer should stand until eliminated.

8. The symptoms of gastric cancer as detected by the conventional mechanical methods of examination, are no longer symptoms but complications of the malady. Hence, awaiting the presence of these symptoms must give way to the detection of their approach.

9. The harder it is to recognize gastric carcinoma the better the prognosis.

MANAGEMENT OF THE OFFICE DIABETIC *

By JAMES RALPH SCOTT, M.D., NEW YORK, N. Y.

THE purpose of this paper is to demonstrate that any physician, wherever situated, can manage the average diabetic patient. The services of the specialist indeed are necessary in the management of unusual or complicated cases, and his advice is invaluable in the treatment of diabetic coma. But the family physician, by virtue of his intimate contact with the patient and knowledge of his domestic and personal environment, should be the one to accept the responsibility for the day by day conduct of the chronic diabetic.

The reason this has not been done heretofore is that the average physician regards diabetes as a complicated and mysterious disease, the treatment of which requires special training and elaborate apparatus. This is not so. I have a patient, a farmer, living in the country, whose wife carries out his treatment, including the giving of insulin, as well as it could be done in a hospital. There are scores of farmers, school teachers, stenographers, and even children who, thanks to Dr. Joslin's pioneer work, are successfully managing their own cases because they cannot afford the constant care of a specialist, and their own physician will not accept the responsibility of treating them.

Indeed, the treatment of this disease fits particularly well into the work of a busy practitioner, because, when properly conducted, the patient does the routine work, and the physician acts only in the capacity of a consultant at semi-weekly, weekly, or monthly intervals, depending upon the severity of the case. These patients require supervision, and the family physician should be the one to supply it. When complications arise, he can call in the specialist, but he himself is the first line of defense.

Diagnosis

The diagnosis of diabetes is easier than that of tuberculosis. The typical case is an obese, middle-aged person who begins to lose weight in spite of an increase of appetite and an extraordinary thirst—for water! As a consequence of the increased water intake, he passes large quantities of urine. This has a high specific gravity and gives a positive test for sugar—to be exact, glucose. A blood sugar determination taken before breakfast will be well over 125 mg. per 100 c.c. of blood. A mild case will give a reading of 150 to 200 mg. A moderately severe case will be 400 to 500 mg., and severe cases will show readings up to 1000 or more. Severe or acute diabetics will show changes in the CO_2 -combining

power, with increase in the cholesterol and acetone bodies in the blood. But since we are considering only the chronic diabetic, these will not be discussed here.

The point is that the diagnosis of the case depends upon the performance of two tests—namely, examination of the urine and blood for glucose. The urinalysis can be done in the office in five minutes with a simple apparatus. This apparatus consists of a medicine dropper, a test tube, a tin cup, a bottle of Benedict's qualitative solution, and boiling water. The test is made as follows:

Place in the test tube one teaspoonful of Benedict's qualitative solution. Add 10 drops of the urine to be tested. Shake the tube to mix the contents thoroughly and place in a cup of boiling water for five minutes. The water must be boiling throughout the test. At the end of five minutes, shake the tube again and note if the color has changed. At the beginning of the test the color is a clear blue. If it remains clear and blue there is no sugar in the urine. If sugar is present, it becomes cloudy and green. Larger amounts of sugar cause it to turn yellow, brown, or red.

The collection of a specimen of blood for a glucose test requires a 20 c.c. Luer syringe, a sterile needle, and a bottle containing a few grains of sodium citrate powder—the amount one can pick up on the point of a penknife. Ten c.c. of blood is collected from a vein in the arm, as for a Wassermann. It is then transferred to the bottle and shaken gently to mix with the sodium citrate. If the specimen of blood is to be sent by mail 2 drops of 40 per cent formaldehyde should be added. This will prevent the fermentation and consequent destruction of the sugar. If the blood is to be tested within two or three hours, this need not be done. Send this specimen to the most conveniently situated biological laboratory—usually in the nearest hospital—and a report can be obtained on the same day. *If there is sugar in the urine, and the blood sugar is well over 125 mg. per 100 c.c. of blood, the blood having been taken before breakfast, the patient may be regarded as diabetic and treated accordingly.*

The physician should be equipped also to test the urine for acetone. While the diagnosis of diabetes does not depend upon the finding of acetone in the urine, its presence indicates a faulty metabolism of fats which should be corrected before leading to more serious complications. The test is done as follows:

Place in a test tube 1 teaspoonful of the urine to be tested. Add 2 drops of glacial acetic acid. Add 3 drops of freshly prepared aqueous solu-

* Read before the Bergen County Medical Society, at Englewood, N. J., on December 8, 1931.

tion of sodium nitro-prusside. Shake well to mix. Layer over 28 per cent ammonium hydroxide. Let stand 5 minutes. If acetone is present a purple ring will form at the junction of the ammonium hydroxide and the urine.

Education of the Patient

Once the diagnosis of diabetes is made, the education of the patient in the management of his own case is the first step in treatment. He must be taught that the criteria for success in treatment are:

1. A sugar-free urine.
2. A normal blood sugar.
3. A weight 10 per cent below the average for age and height.

If these conditions are fulfilled the patient is being adequately treated.

Each patient or some member of his family should be taught to do three things:

1. Test the urine for sugar.
2. Calculate his diet.
3. Give himself insulin.

This can be done anywhere, and the equipment required is simple: A urine-testing outfit as outlined above, a 500 gm. food scale, a table of food values, and an insulin syringe with insulin. With a very little patience, this training is not so formidable a task as it might appear to be. By actually performing a sugar test before a patient he can learn to do it in five minutes. All except the mildest cases are placed on weighed diets from the first. This often necessitates a struggle, but the effort expended will be repaid many times in the increased interest and co-operation of the patient.

A patient's routine should be about as follows:

1. He tests his urine for sugar before breakfast and one hour after each meal, and records the results in a notebook kept for the purpose. The results of the test are recorded as blue, green, yellow, or orange. This gives a roughly quantitative record of the amount of sugar in the urine, and is a reliable index of the amount of insulin required, as well as what time of day it is most needed.
2. He weighs and calculates his diet until he has become familiar with the prescribed amounts of each article of diet. He is then allowed to dine at a restaurant where he has to estimate the quantity of food, after which he does a urine test to see how close he came to his allowance. This can become a fascinating game.
3. He gives himself insulin as prescribed by his physician. After following the effects of insulin on his tests, he is allowed to increase or decrease the insulin one or two units a dose as indicated by his tests.
4. He visits the office anywhere from twice a

week to once a month depending upon the severity of his case. All patients should be seen once a month. On each visit the patient should bring a specimen of urine—usually the first in the morning—to be tested for sugar and acetone. He should bring the notebook in which is recorded each day's diet, the results of the four daily urine tests, and the insulin dosage. The patient's weight is taken and recorded on the chart to compare with his theoretical normal, and instructions given as to diet and insulin. A blood sugar determination should be done every week until the patient is stabilized as to diet, weight, and insulin, then once a month. A well-trained patient not on insulin need not submit to a blood test oftener than once in two or three months.

Principles of Treatment

Before discussing diet in detail, let us review briefly some of the principles of diet in relation to diabetes.

Every patient knows that the diabetic is unable to metabolize the normal amount of carbohydrate food. What is not so generally known is that there is also something wrong with his metabolism of fat,—indeed, it is his inability to handle fat that is the cause of acidosis and diabetic coma. And there is some evidence that the breakdown in fat metabolism is the more important of the two. The history of the treatment of diabetes since the introduction of insulin has been a tendency to give more and more carbohydrate and less and less fat, until some very good clinicians allow as much as 300 gm. or more of carbohydrate per 24 hours. This large allowance of carbohydrate is, of course, possible only with the use of insulin.

The principle upon which both the prevention and treatment of diabetes is based is to keep the patient slightly undernourished, usually a weight of 10 per cent below the normal for age, height, and sex. The only successful treatment of diabetes before the "insulin era" was one which, by some means or other, accomplished this end. The emaciated patient and children were not very successfully treated at that time.

But now all that is changed. Insulin enables us to build up the emaciated patient to the proper weight, and keep him there. Children can now eat the food necessary to maintain weight and promote growth; and even the fat patient can reduce more quickly and safely. Insulin enables him without the development of acidosis to metabolize his body fat as he draws on it to provide calories not supplied by his diet.

The three elements of food to be considered are carbohydrate, protein and fat. The necessary vitamins, of course, must be supplied to diabetic patients as well as to normal persons.

The chief carbohydrates are sugar and starch. Sugar and candy are concentrated carbohydrates, and should be avoided by diabetics; this also in-

cludes cookies and cakes, or anything made with sugar. The most common starch food is flour. Bread and cereals in general are 60 per cent carbohydrate. Potatoes, rice and bananas are 20 per cent carbohydrate. Bread should not be eaten until the urine is sugar-free, and then only as prescribed by the physician. I do not prescribe diabetic breads as a routine. They are usually 30 per cent carbohydrate, except Lister and soy bean bread, which are high in protein—and potatoes, which are 20 per cent carbohydrate, are safer and cheaper. Most of the vegetables are from 5 to 15 per cent carbohydrate.

The principal protein foods are meat, fish, fowl, eggs, cheese and milk.

Fat is supplied by butter, cream, lard, olive oil, the fat of meat, and nuts.

The fat patient can usually be rendered sugar-free on an under-nutrition diet alone without insulin. Any reducing diet should be as low as possible in fat. In the very process of reducing, the patient is using his body fat, and the addition of too much exogenous fat will produce acidosis. If this occurs, it can be checked by the use of insulin.

With malnourished individuals and children, however, insulin should be used from the start. They need to build up strength and promote growth. Therefore adequate diets should be prescribed at once and enough insulin given to handle them. Adults require not more than 30 calories per kilo of body weight. Children require from 40 to 50 calories per kilo body weight. Adults require from $\frac{3}{4}$ of a gram to 1 gram of protein per kilo body weight. Children require from 3 to 4 gm. of protein per kilo body weight.

The protein requirements of both adults and children must be met, but not exceeded. The caloric requirement of the diet varies with individuals, but must be sufficient to maintain the patient at 10 per cent below the average in weight. The weight of the patient is a better guide in calculating the caloric requirements than too fastidious a calculation of the theoretical caloric needs. In any event, after the protein requirements are met, the caloric content of the diet can be obtained by giving enough carbohydrate and fat to meet it,—*always* giving less fat than carbohydrate. This is quite contrary to the accepted practice a few years ago, but is now almost universally followed. Nowadays every diabetic about his usual daily life should be taking at least 100 gm. of carbohydrate daily. None of my patients is taking more than 200 gm. and the average is about 140 gm.

Diet

The most confusing aspect of the treatment of diabetes is the management of the diet. This I have tried to simplify by adopting for my patients, both in the hospital and in the office, only three kinds of diet. They are

1. The estimated diet, for mild cases.
2. The calculated diet, for moderately severe and severe cases.
3. The fluid diet, a temporary one to be used during acute illnesses or infections.

The first and third are extremely simple, both for the physician to order and for the patient to carry out. The second diet is the easiest of all to order; indeed it is nothing but a prescription of three figures. The filling of this prescription is of necessity the work of the patient, and in doing this he receives a training which will be of lifelong benefit to him, and which is often life-saving.

1. *The Estimated Diet.* This is for the mild diabetic who is not taking insulin. It consists of a small list of foods which are to be avoided. These are sweets, starches, butter, oil, or fat, and anything made with flour. This leaves him on a diet consisting mostly of vegetables, meat, eggs, milk in moderate amounts, cheese and all but the particularly sweet fruits, such as bananas, prunes, raisins, etc. He is, of course, instructed to eat moderately even of the foods allowed. If vegetables are restricted to the 5% variety and fruit limited to grapefruit and oranges, the patient would have difficulty in eating more than 100 gm. of carbohydrate daily—the normal being 400 gm. Of course broth and tea or coffee without cream or sugar are allowed in unlimited amounts. Water drinking should be encouraged. A mild diabetic on this diet for a few days or a week will become sugar-free. Bread is then allowed in increasing amounts up to a reasonable number of slices a day, one at each meal. Sweets should be avoided permanently, even by the mild diabetic. An occasional use of them will only perpetuate the taste, and sooner or later they will get him into trouble. It is well to maintain a moderate restriction of fats and to guard constantly against overweight.

2. *The Calculated Diet.* This requires the use of a 500 gm. food scale and a table showing the carbohydrate, protein and fat content of foods. A number of these tables exist. One of the most comprehensive can be obtained from the U. S. Department of Agriculture by writing for Bulletin No. 28. Most of my patients are brought up on Joslin's "Manual of Diabetes" which contains a practicable table of food values. Any authoritative table of analyses will answer the purpose.

The diet is prescribed by the physician, giving the number of grams of carbohydrate, protein, and fat allowed for the 24 hours; then the patient goes home and figures it out for himself. This has the obvious advantage of relieving the physician of the complexities of the mathematics involved. As a profession we are notorious for our deficiencies in this branch of science, and I personally find that my patients, or some member

of their family, are much more proficient in this phase of the routine than I am.

An average diet, and a good one to start on, would be C 140, P 70, F 50, a total of 1290 calories for the day's allowance. If sugar appears in the urine on one of the four daily tests, 5 units of insulin can be given before the corresponding meal on the following day, and increased or decreased as indicated. At first the patient should be seen daily and the insulin changed by order of the physician. In the course of three or four days on this diet the insulin dosage necessary to maintain a sugar-free urine can be determined. When once stabilized, the patient himself can vary his insulin two units a dose up or down as indicated by his four daily urinalyses. A moderately severe diabetic on this diet would probably need about 10 units before breakfast, 5 before luncheon, and 8 before dinner, written 10-5-8. On subsequent visits the diet prescription can be varied,—by the physician only,—depending upon the patient's weight in reference to his theoretical normal. *The patient's weight is the best guide to his caloric requirements, and his four daily urine tests are the best guide to his insulin requirements.*

To simplify the routine of ordering, I have confined the variety of "prescriptions" for the calculated diet in hospital work to the five following, which are ordered by number only:

I.	C 130	P 65	F 30	Calories	1050
II.	C 140	P 70	F 50	"	1290
III.	C 150	P 75	F 110	"	1890
IV.	C 170	P 85	F 125	"	2145
V.	C 200	P 90	F 125	"	2510

Of course in private practice the jump from C 130 to C 200 may be made by any number of easier stages. In hospital work, however, definite orders are necessary to avoid confusion.

A sample of the above diet, Number II, would be as follows:

No.	Grams	Food	Carbohydrate	Protein	Fat
-----	-------	------	--------------	---------	-----

Breakfast					
100		Prunes	19.0	1.0	
147		Oatmeal	11.8	2.9	1.4
4 oz.		Milk	5.6	3.2	4.4
2		Eggs		14.0	11.0
20		Bread	10.6	1.8	.2
Total			47.0	22.0	17.0

No.	Grams	Food	Carbohydrate	Protein	Fat
-----	-------	------	--------------	---------	-----

Dinner					
60		Roast beef		14.4	6.0
103		Potato	21.6	3.1	
150		String beans	10.5	3.0	
30		Lettuce	.9	.3	
50		Tomato	2.0	.5	
12		Butter			10.2
130		Pineapple	13.0		
Total			48.0	21.3	16.2

No.	Grams	Food	Carbohydrate	Protein	Fat
Luncheon					
1 egg		Omelette		7.0	5.5
3 oz.		Milk	4.2	2.4	3.3
9		Butter			7.6
20		Bread	10.6	1.8	.2
124		Peas	21.2	8.7	
150		Cauliflower	7.5	3.0	
50		Lettuce	1.5	.5	
		Coffee jello		2.5	
Total			45.0	25.9	16.6
Total for day			140.0	70.1	49.8

Once the patient has acquired facility in calculating his diet, twenty minutes is all the time required to outline his meals for the day. While accuracy is essential in calculating a diet, it must be remembered that the figures given are approximate only, and a variation of a gram or two in each column for the day's amount is not important.

3. The Fluid Diet. This diet consists of buttermilk and orange juice, and has facetiously been dubbed by some of my associates as the "B & O" diet. The two fluids are given in six ounce amounts alternately every two hours for 14 out of the 24 hours. They are supplemented by tea, coffee, broth and water so that the patient receives a glass of fluid every hour, during the daytime. It is not given at night. It is ordered as follows:

7 A.M.	Orange juice,	6 ounces
9 A.M.	Buttermilk,	" "
11 A.M.	Orange juice,	" "
1 P.M.	Buttermilk,	" "
3 P.M.	Orange juice,	" "
5 P.M.	Buttermilk,	" "
7 P.M.	Orange juice,	" "
9 P.M.	Buttermilk,	" "

The food value of this diet is C122 P21 F7, calories 635.

If the patient dislikes buttermilk, skimmed milk is given instead.

Being relatively high in carbohydrate and low in fat, it is an ideal diet for combating acidosis. During acute illness of any kind with fever, or for surgical emergencies, this diet is now ordered routinely on my service at St. Luke's Hospital.

During febrile disturbances the glucose tolerance varies so greatly from hour to hour that the usual a. c. administration of insulin is impracticable. Consequently when it becomes necessary to order the "B & O" diet, the urine is tested with Benedict's qualitative solution every two or three hours, and insulin is given according to Dr. Joslin's "color formula" as follows:

If the test is orange, give 15 units of insulin
 If the test is yellow, give 10 units of insulin
 If the test is green, give 5 units of insulin
 If the test is blue, give 4 oz. of orange juice.

This is absolutely a fool-proof formula, and can be followed literally without danger to the patient.

Insulin

Of the patients in the clinic, 30% are using insulin; the amount varies from 5 to 60 units a day; the number of doses varies from 1 to 4 a day. The insulin is usually given about 20 minutes before the meal; in some instances as long as 2 hours before. If 1 dose is necessary, it is given before breakfast; if 2 doses, before breakfast and dinner; 3 doses, before breakfast, lunch, and dinner; 4 doses, before the three meals, and, a small dose, from 3 to 5 units, is given at bedtime. When cutting down on the number of injections per day, this order is reversed.

I am often asked how to determine the quantity of insulin required in each individual new cases. There is no infallible rule. Any patient showing sugar in the urine can start with 5 units of insulin before breakfast. If sugar appears in the urine after the other meals, he can take 5-5-5; i.e., 5 units before each meal, running the dosage up or down until the necessary quantity is being given. By varying the dosage according to tests of the 4 daily single specimens, an equilibrium is soon reached. Keeping the urine sugar-free appears to improve the patient's tolerance. After a week of sugar-free urine, therefore, the diet can gradually be increased or the insulin decreased. With a thin person the former procedure would be adopted, and with a fat person the latter.

A certain quantity of insulin given 3 or 4 times a day is more effective than the same amount given only once or twice a day, with less risk of an insulin reaction. A patient was referred to me recently who was taking 80 units of insulin daily—40 B—40 D on a carbohydrate allowance of 170 gm.,—a severe diabetic. He frequently suffered from insulin reaction, and showed sugar in his urine on one or more of his 4 daily tests. By redistributing the insulin so that he was taking a dose before each meal and 3 units at bedtime (11 P.M.) he became sugar-free on all his tests and had no more insulin reactions—and this was accomplished on 60 units per day, as contrasted with the 80 units he was previously taking, with no change in his diet.

Insulin reactions are comparatively infrequent in adults. In children they are common. Every child taking insulin of 10 units or more a dose should carry 2 lumps of sugar or an orange to be used in such emergencies. If insulin is taken at all it must be used daily. Patients who test their urine 4 times daily, and vary their insulin accord-

ingly, rarely suffer from insulin reactions. At the most, insulin reactions are disagreeable rather than dangerous.

If it becomes necessary to give more than 10 units of insulin a day, it should be given in 2 doses, if more than 20 units, in 3 doses, and if more than 30 units, a small dose should be given at bedtime.

Liver has recently been added to the diabetic diet. It is apparently an insulin saver; $\frac{1}{2}$ pound of liver a day will take the place of from 5 to 10 units of insulin. I have a private patient who has been taking liver for 3 months with gratifying results. With no other change in diet he has been able to reduce his daily insulin from 10 units t. i. d. to 5 units once a day, without showing sugar in the urine and with no elevation of the blood sugar. Whether or not this marked improvement can be attributed entirely to liver, I do not know, but it certainly has helped. After 3 weeks of the liver diet the patient balked, but since giving him before 2 of his daily meals a well seasoned broth prepared from fresh liver, he has taken it willingly and has thrived on it. The broth is prepared by macerating $\frac{1}{2}$ pound of liver (it can be put through a meat chopper,) and steeping it for an hour in warm water. The pulp is then squeezed into the water and broth set aside in the icebox to be served as required. The preparation is not boiled, as boiling destroys the insulin-saving principle.

Another insulin saver is exercise. A good vigorous walk will use up a considerable quantity of sugar and allow the insulin to be decreased accordingly. Two walks of half an hour each are better than one walk of an hour. Patients are encouraged to experiment with exercise as they do with food and insulin to determine their tolerance. Unusually prolonged or vigorous exercise in a diabetic using insulin will produce insulin reactions unless the insulin is reduced from the usual amount. In a diabetic, exercise is a drug second in potency only to insulin and food.

General Hygiene

Finally, infection of any kind is dangerous in a diabetic. The first breakdown in sugar tolerance is often initiated by an infection. Infection causes a mild case to become severe, and is frequently fatal to a severe case. Therefore, care should be taken to remove all obvious foci of infection. The teeth should be x-rayed, and those teeth showing apical abscesses should be removed. Infected tonsils should be removed. The sinuses, the gall bladder, the prostate, and the Fallopian tubes should be investigated as possible foci of infection.

Particular care should be directed to the lower extremities. Arteriosclerosis is more marked in diabetics than in others, and occurs earlier in life. Hence abrasions and injuries to the feet are

slower to heal. If neglected, gangrene may intervene. Bathing of the feet in hot water is beneficial to the circulation. Daily evacuation of the bowels should become a fixed habit. An adequate amount of sleep should be obtained, and every effort made to avoid situations causing chronic worry, anxiety, or apprehension.

Summary

1 Need of supervision of the chronic diabetic by the family physician is pointed out

2 Ease of diagnosis is stressed and a list of the necessary apparatus is given

3 A plan of education of the patient is outlined

4 Principles of treatment are briefly discussed

5 Three practical diets are outlined in detail

6 The use of insulin, liver and exercise is explained

7 A few remarks are made on general hygiene in relation to diabetes

SUB-ACUTE BACTERIAL ENDOCARDITIS*

By NORMAN STRAUSS, MD, NEW YORK, N Y

History The clinical entity of Sub-Acute Bacterial Endocarditis, is apparently a rather recent and new disease. This impression is obtained from reading available literature. Sir William Osler,¹ in 1908 before the association of British physicians, presented ten cases, which he termed chronic infectious endocarditis, and stated at that time, that in his previous reports, in his Goulstonian lectures in 1885, he had not seen any cases which correspond to these present ten cases. In 1909, Sir Thomas Hordes² presented a series of 151 cases of infectious endocarditis, at the St Bartholomew Hospital, including 21 cases which would fall into the group of sub-acute. In 1910,^{3,4} Emanuel Libman presented his group of 43 cases. A point worthy of note is that we, up to the present date, have not been able to add anything new to the description or treatment, as outlined by these men in their original articles.

Definition It is of importance at this time, to define sub-acute bacterial endocarditis, and to differentiate it from similar endocardial infections. By sub-acute bacterial endocarditis, we mean a case of sub-acute infection, superimposed upon a previously damaged heart valve, characterized by symptoms and signs of a low-grade toxemia, and embolic phenomena. This group of cases, must be differentiated from rheumatic endocarditis and acute terminal bacterial endocarditis.

Pathology A fundamental understanding of the pathological background of this disease, will enable us to understand the clinical progress more clearly. The endocardial inflammatory process of rheumatism produces a thrombus, which is characterized by the exudation of red blood cells, white blood cells, fibrin, and blood platelets. This thrombus undergoes

subsequent organization, producing a typical wart.

The subsequent contraction of these warts, results in scar formation with a resulting stenosis and insufficiency of the valve leaflets. With a superimposed bacterial infection of these warts, another acute exudate is thrown out this time containing bacteria and due to the diminished blood supply caused by previous rheumatic damage, these new vegetations become very loosely organized, and as the blood rushes past the loosely organized vegetations, embolic phenomena are produced.

Etiology Sub-acute bacterial endocarditis is always superimposed upon a previously damaged heart valve. This heart valve may have been damaged by congenital mal-formation (particularly a bicuspid aortic) or by rheumatism. All observers agree, however, that we must have some evidence of a previously damaged valve, before we find a sub-acute bacterial infection superimposed. The age most prone to be hit by this disease, is from about 10 to 35 years of age, and the liability to this infection, varies inversely as the age. Statistics⁵ show that the number of cases under twenty years of age, are twice as many as those over 20. The sexes are affected about equally, 60% being males and 40% being females. The time which elapses between rheumatism and the onset of sub-acute bacterial endocarditis, varies from a few months to several years, and in that time interval, the patient may enjoy excellent health. Just what starts sub-acute bacterial endocarditis, one cannot say, because we frequently see cases who give no history of added infection. The insidiousness of its onset brings up an important point for discussion. The point in question being, "is sub-acute bacterial endocarditis, a part and parcel of a rheumatic infection in a more advanced stage, or are rheumatism and sub-acute bacterial en-

* Read before the Clinical Society of the Jewish Memorial Hospital May 5 1931

docarditis two distinct diseases?" While histopathological and bacteriological evidence points towards two distinct diseases, still the clinical course from onset to termination, is more suggestive of one disease, chiefly related to the point of infection and resistance.

Symptoms: As has been just mentioned, the onset of this disease is very insidious and difficult to determine. Symptoms can best be described under two main headings as suggested by Bierring.⁷

1. Toxic: The onset of the toxic symptoms is characterized by—1-lassitude, 2-vague pains, 3-loss of appetite, 4-chills, 5-vertigo, 6-headache, 7-cough, 8-sweats.

As can be readily seen, these symptoms assimilate any form of mild low-grade chronic sepsis, as: tuberculosis, typhoid and malaria. As the disease progresses, low-grade sepsis produces:—a-fever, b-loss of weight, c-splenic enlargement, d-secondary anemia.

(a) Fever: The fever is variable, intermittent, low-grade, varying between 99 and 101. Temperature, however, may be absent for a period of time. During the embolic stage, the temperature may shoot way up, hitting 104 or 105.

(b) Loss of weight: Loss of weight is generally slow but progressive.

(c) Splenic enlargement: Splenic enlargement is rather an early finding and is unquestionably due to an acute cloudy swelling and splenic tumor, as found in any chronic sepsis.

(d) Secondary anemia: Secondary anemia is slow but progressive. But even with a profound anemia, we find no tendency towards a pernicious anemia type. There is a progressive fall in both hemoglobin and red cell count. The white blood cells may increase to 12 or 14,000, producing a leucocytosis and polynucleosis. However, a leucopenia with a mononucleosis, is not an uncommon finding. The anemia produces a characteristic pallor and pigmentation to the skin, giving the patient a very tired look or café au lait color.

2. Embolic: The outstanding point of the embolic phenomena, is that there is no tendency to pus formation, despite the fact that the emboli are bacterial containing.

(a) Petechiæ: Petechiæ may be found in the conjunctiva, in the mucous membrane of the mouth, soft palate and pharynx, under the tongue or in the skin, particularly on the anterior chest and abdomen. Petechiæ occurs in about 80% of cases. They are usually discretely distributed and become more extensive towards the end of the disease. They are small pinkish reddish areas, which do not disappear on pressure, and can, therefore, be differentiated from small skin hemangiomas.

They last for a few days and then begin to fade, leaving a yellowish brown stain.

(b) Osler's nodes: These are hard, firm, very tender and painful nodes, which occur on the pads of the fingertips, hands and toes. They are due to emboli in the skin. Although these nodes are called Osler's nodes, they were originally described as stated by Dr. Osler, by Dr. Mullen.

(c) Splenic infarction: Infarction to the spleen, produces sharp pain in the left upper quadrant, a rise in temperature and an enlargement of the spleen. Repeated splenic infarctions are not uncommon.

(d) Pulmonary infarctions: Infarction of the lung produces sudden pain in the chest, cough, bloody sputum, and elevation in temperature.

(e) Mesenteric infarction: Infarcts to the mesentery produce sudden abdominal pain, generalized tenderness and rigidity, and intestinal bleeding.

(f) Cerebral infarction: Infarcts to the brain, produce local neurological symptoms, as: paralysis, aphasia, etc., depending upon the cerebral artery involved.

(g) Kidney: Infarcts to the kidney are of particular importance, because they are frequently quite small but numerous, thus producing a focal glomerular nephritis, as originally described by Loehlein⁸ in 1910, and subsequently more extensively studied and described by George Baehr⁹⁻¹⁰ of Mt. Sinai, in 1912. Fishberg¹¹ offers the following pathological description: "The kidneys are normal in size, or more often somewhat enlarged. The capsule usually strips readily from the smooth surface. The most characteristic feature, though not invariably found, is the presence of small, usually irregular hemorrhages. . . . Large and small infarcts are common resulting from the occlusion of large vessels by emboli, from the endo-cardial vegetations. Microscopically, characteristic glomerular lesions are found. . . .

"The process starts with swelling and granular change of the walls of one or more capillary loops, situated in any part of the tuft. This progresses until there is a homogeneous mass, which stains deeply with eosin, and contains nuclei in various stages of disintegration. The lesion is thus a typical coagulation necrosis. Very striking, is the paucity of the cellular reaction around the lesion, though there may be a few leucocytes or slight proliferation of fixed cells, adjacent to the necrotic area. . . .

"Scarred lesions are usually also to be found, and in the healed cases, may be the only ones present. Healing of the lesions is marked by connective tissue replacement of the necrotic

area. The resulting scar, which ultimately becomes hyaline, is sharply demarcated from the rest of the glomerulus, and merges with the interstitial connective tissue outside of the capsule. . . .

"The tubules often show well-marked, fatty changes, collapse and atrophy of the epithelium. . . .

"That the atrophy is ever permanent enough to lead to a notable degree of contraction of the kidney, has not so far as I am aware, been demonstrated."

Renal infarction is characterized by the finding of red blood cells in the urine.

Heart: Strange as it may seem, the cardiac symptoms are conspicuous by their absence, and are of little importance. The original murmurs produced by rheumatic endocarditis, are altered little, if any. The heart rate is usually increased and may become very rapid during the elevation in temperature. An interesting finding, though difficult to explain, is the fact that cardiac arrhythmia is rather rare in these cases in the bacterial stage in contradistinction to the fact that rheumatic endocarditis show auricular fibrillation early in the disease. There are no characteristic electro-cardiographic findings. Cardiac decompensation is uncommon during the bacterial invasion. Sub-sternal tenderness is a rather persistent and prominent finding.

Blood cultures: Positive blood cultures are found in about 90 to 95% of the cases. The causative organism most frequently being the streptococcus viridans as shown by Libman. There are times in the course of the disease, however, when the blood is free of any invading organism. This period, which may last for several months, is known as the "bacteria free stage."

Prognosis: With all the above-mentioned symptoms, the patient does not appear to be very ill, and has a commendable sense of well-being. The prognosis, however, is very grave,

even though the disease at the out-set may appear to be very innocent. Libman reports four recoveries in a series of 300 cases studied. Sir Thomas Hordes reported the same number of recoveries in his series. These patients die of exhaustion as a result of the progressive anemia, or as a result of an embolus to one of the vital centers.

Treatment: Various forms of treatments have been tried, such as: autogenous vaccines, immune sera, intravenous dyes, and various arsenical preparations, none of which, however, have produced any spectacular results. Transfusions seem to buck up the patient for a very short time, and have proven of little value as a curative measure. Large doses of sodium salicylate seem to render the patient comfortable at least for a short time. The advent of bacteriophage is promising, but as yet has produced no brilliant results.

Prevention: In view of the fact that any known form of treatment is of no avail, our only ray of hope and only golden beam of sunshine, lies not in the cure of sub-acute bacterial endocarditis, but rather in its prevention.

Realizing the relationship of focal infection to rheumatic heart disease, a plea for the removal of infected foci, in an effort to prevent rheumatism, is hereby whole-heartedly entered.

THE DIAGNOSIS AND MANAGEMENT OF HEMOPHILIA IN CHILDHOOD

By I. NEWTON KUGELMASS, M.D., NEW YORK, N. Y.

From the Department of Pediatric Research, the Fifth Avenue Hospital, New York.

HEMOPHILIA, a clinical chimera for many a bleeding problem, is too rare a condition to cover for so many hemorrhagic disturbances, is too hereditary a disease to include so many mature bleeders, is too well-defined a disease entity to become a haphazard label of hemorrhagic confusion. A solitary hemorrhage for the first time requires that every local cause be excluded before a diagnosis of hemophilia is ventured. Profuse hemorrhage at birth¹ is due to melena, infection, or trauma in origin unless inheritance makes hemophilia a consideration. A prolonged clotting time alone is never pathognomic of hemophilia. Such common correlations with hemophilia have confused literature to such an extent that Bulloch and Fildes² of the London Eugenic Laboratory have only been able to authenticate 44 hemophilic families out of 273 reported in a century of literature!

Hemophilia is of primary concern to the pediatrician because it first becomes manifest at about the first year of life and continues throughout childhood. Curiously enough all the trauma incident to birth never precipitate the onset of hemophilic hemorrhage from any part of the newborn's body. The dangers from bleeding begin with either artificial trauma incident to development, or with sudden surgical interference. But these dangers wane with the years until early manhood since the child's body is evidently able to correct the hereditary defect in the course of growth and development. Nevertheless one-half of hemophilic children die before acquiring immunity from this chronic infirmity because of inadequate medical supervision.

In our study of hemorrhagic diseases³ we have been concerned with hemophilia for the formulation of the criteria necessary for diagnosis, for the quantitative determination of the clotting substances involved in blood coagulation, for the determination of the nature of the clotting defect, for the interpretation of the mechanism of hemophilia and finally for the development of a practical mode of management of the hemophilic child. Hemophilia is a well-defined disease and so precludes any possibility of pseudo-hemophilias. The criteria both necessary and sufficient for the diagnosis of hemophilia may be summarized as follows:

- (1) Hereditary in origin—family history.
- (2) Limited to males—infancy to early manhood.
- (3) Tendency to repeated bleeding—spontaneous or traumatic.
- (4) Prolonged clotting time—normal bleeding time.

(5) Blood clotting function deficient—platelets defective.

1. *Hereditary Nature of Hemophilia:* One of the most remarkable features of the disease is that it runs in families, an observation recorded amongst the earliest writers on hemophilia. Though the ancients knew of the disease, its first mention was in 1519 by Albucasis, the great surgeon of the Moorish period, who described boys dying from uncontrollable bleeding. Classical cases were later described by Consbruch (1793) and Rave (1796). It was not considered as a distinct disease entity however until 1803 when Dr. John C. Otto, a physician of Philadelphia,⁴ published "an account of an hemorrhagic disposition existing in certain families." Otto stated that "males are only affected and all are liable to it. Though females are free they are capable of transmitting it to their children." Nasse⁵ in 1820 made the first careful study of the pedigrees of hemophilics and formulated the universally accepted generalization that males alone are bleeders, the disease being transmitted by apparently normal females through their marriage with normal males.

Subsequent experience led Grandider to state that it was the most heritable of hereditary diseases. The disease is transmitted to males from generation to generation through the female. It is a recessive sex character linked to a single male chromosome. It may be dormant for many generations only to reappear in some remote male descendant. Its incidence follows the laws of Mendelian inheritance. The female conductor transmits the condition to about 2/3 of her offspring and the rest are not conductors. In many families the ancestral taint has been present for over a century. Each of these families usually has a number of bleeders to characterize the transmission of the disease. (See chart.)

X and x are sex chromosomes. X = normal, x = hemophilic carrier. A normal X is dominant to the hemophilic x whose presence is thus concealed when combined with a normal X. The female possesses two sex chromosomes, one inherited from either parent while the male possesses but one derived from his mother.

Mating 1. A hemophilic will not have children with hemophilia provided he marries a normal woman. Sons of a hemophilic are normal and cannot transmit hemophilia. Daughters of a hemophilic will be normal but will all transmit hemophilia to half their sons.

Mating 2. A woman carrier of hemophilia married to a normal man will transmit the defect to half their daughters and to half their sons as hemophilia. The other children are normal.

MATING	PARENTS		OFFSPRING	
	Male	Female	Male	Female
1.....	x hemophilic	XX normal	X normal	Xx carrier
2.....	X normal	Xx carrier	X normal x hemophilic	XX normal Xx carrier
3.....	x hemophilic	Xx carrier	X normal x hemophilic	Xx carrier xx hemophilic

Mating 3. Theoretically it is possible for a girl to show hemophilia provided her father was a hemophilic and her mother a carrier. This is made impossible of realization because the presence of a double quantity of the defect acts as a lethal factor inhibiting the development of the embryo.⁶

Normal males of a hemophilic family may marry but all daughters of hemophilic males are carriers and should not reproduce. Even in a hemophilic family with some normal females marriage should be prevented because it is impossible to predict which are carriers and which are free from the defect until they reproduce.

2. Hemophilia Confined to Males. The immunity of the female sex from hemophilia has been observed since the first published case by Connsbruch in 1793. Many have since repudiated this view and asserted that females may show the less pronounced forms of hemophilia. A pointed argument advanced from analogy to other sex limited diseases—color blindness and pseudo-hypertrophic muscular palsy—considered confined to the male sex, is the occurrence of undoubted cases in females. Bulloch and Fildes' critical study of the hemophilic families of the last century reveals no abnormality beyond what might be observed in any collection of females taken at random. Bucura⁷ showed conclusively that all alleged hemophiliacs amongst females reported in the literature did not fulfill the necessary and sufficient criteria for the diagnosis of the disease.

No convincing evidence has therefore appeared which ever justifies the diagnosis of hemophilia in the female or the transmission of the disease by a male. Immerman's contention that the question of hemophilia in the female awaits some method of diagnosis which does not depend on outward symptoms may be dismissed for biochemical examination of the blood clotting components were found normal in mothers of our hemophilic male patients. The absence of typical hemophilia in the female has been explained by Little and Gibbons⁸ from an analysis of cases filed in the Eugenic Records Bureau that a sex-linked lethal factor eliminates the affected females. Kubanyi⁹ observed that in families of hemophiliacs the males whose group corresponded

to the mother were afflicted while those of a different group escaped hemophilia. Group IV appeared the most prevalent for severe hemophiliacs.

3. Hemophilic Tendency to Bleeding. Physical integrity disturbed by trauma passes unnoticed in a normal child but manifests itself by hemorrhage with no tendency to stop in the usual manner in a hemophilic. A significant feature of the disease is not so much the occurrence of bleeding or the rapidity of blood flow but rather the duration of the bleeding. It persists for hours and often for days and weeks as a slow trickling or oozing away from the surface in spite of treatment and may be even exsanguinating. Spontaneous arrest of the bleeding occurs after the patient has been reduced to a state of anemia.

The hemorrhage may be external or internal. The blood may issue from any area of the broken skin or be suffused beneath it, constituting the typical bruise, echymosis or hematoma. The blood may also escape into internal cavities or be lost to the body by way of excreta. There is great variation in the ease with which different hemophiliacs may bleed as well as in the same hemophilic at different times and the severity of the hemorrhage may depend somewhat upon the point which has been traumatized. Mucous and serous membranes are relatively low in substances which promote coagulation as compared with the skin. This accounts for the short bleeding time from a pin prick or a clean incision through the skin in contrast to the profuse bleeding which may follow lacerations of mucous membranes.

Hemophilia becomes manifest by hemorrhage from the nose and gums more commonly than from any other mucous membranes and particularly into the joints. *Epistaxis* is of common occurrence in bleeders and even if alarming does not alone justify the diagnosis of hemophilia. Hemorrhage from the *mouth* following the eruption of the milk teeth frequently heralds the onset of the disease. The umbilicus at birth is rarely a site of hemorrhage in hemophilia. The large number of umbilical hemorrhages quoted in the literature as hemophilia are either infectious, luetic, or hemorrhagic disease of the newborn. Articular effusions constitute one of the most typical features of the disease, the knee and elbow joints being most commonly affected.

Freund¹⁰ showed that bleeding occurs first in free joint spaces, later in synovial tissues where hematoma form and finally in subperiosteum and bonemarrow. The accumulated blood remains at great tension in the joint. And once a hemorrhage has occurred in a joint the result is a *locus minoris resistentiae* with chronic susceptibility to recurrence.

Hemophilic bleeding is in the majority of cases definitely traced to trauma. Various attempts have been made to draw a sharp line of demarcation between these two types of hemophilics or even to attribute the spontaneous hemorrhages to small traumata which have escaped attention. In my experience hemorrhages occurring in the hemophilic child are precipitated either by trauma or by infection. I believe that the so-called type of spontaneous bleeding in hemophilics is due to the presence of some intercurrent infection in the body. Our experimental evidence indicates that the presence of infection markedly disturbs the clotting mechanism in the direction of bleeding in hemophilics.

The first manifestations of hemophilia are seen in 70% of the cases before the second year. The trauma incident to birth is not productive of hemorrhage in a hemophilic because of the presence of the mother's thrombocytes and the female sex hormone in the blood of the newborn. It is not until external and artificial trauma is induced in the form of ritual circumcision, division of frenum liguae, piercing ears or ragged severance of an ill-tied cord that the onset of hemophilia is heralded. Otherwise the first year of life is usually free from hemophilic warning. But with the beginnings of walking do hematomas suggest the hemophilic state. Nevertheless in the milder cases first bleeding occurs with surgical interference—tooth extraction, tonsillectomy, myringotomy, etc. The liability to hemorrhage is always *chronic*. There is a progressive decrease however in the number and degree of the hemorrhages occurring so that by maturity the individual is usually free from his infirmity. Schloessmann¹¹ observed hemophilia to manifest itself characteristically different in each of the family groups studied. Each of the 24 families with bleeders amongst the 1600 members showed definite types of bleeding, sites of origin, intensity and periodicity to be characteristic of each family.

4. *Prolonged Clotting Time of Hemophilic Blood.* The earliest attempts to interpret the nature of hemophilia were to subject the bodies to post-mortem examination. Nothing of fundamental importance was revealed by these studies of the vascular system. Pathologists have noted however for some time that the shed blood did

not clot or did so only imperfectly after an abnormally long interval. But it was not until Wright¹² devised his instrument for measuring the time taken during coagulation that the question was placed on a firmer basis. He noted a constant increase in the clotting time of hemophilics as compared with normal blood. Difference of opinion arose. Sahli¹³ demonstrated that blood by venapuncture alone unaltered by tissue products gives constant values and even then the clotting time is indicative only in the inter-hemorrhagic period and not during or immediately after a severe hemorrhage.

The bleeding time in hemophilia is normal. This means that the time of duration of a hemorrhage which follows the puncture of the ear is within three minutes. This may appear paradoxical for hemophilia is characterized by bleeding. But, a simple pin prick does not bleed abnormally so that one may safely puncture a vein, finger or ear for purposes of examination. Mucous membranes have a relatively low content of tissue clotting substances, so that slight trauma of mucosae of joints is often followed by distressing hemorrhage. Fine skin punctures make for the development of sufficient tissue clotting substances sufficient to coalesce the blood platelets. They form platelet thrombi and thus arrest the bleeding. But scratches usually cover too large a skin area to enable the arrest of bleeding. The distinctiveness of the normal bleeding time according to Duke *in* hemophilia is an established fact, although it does not pertain to the bleeding tendency in active hemophilia.

5. *Blood Clotting Function Deficient in Hemophilia.* Normal blood is endowed with the protective power of resolving itself into a solid felted mass, the clot, effectually sealing up an inflicted wound and thus preventing a fatal issue. This biochemical property whereby a change in the environment of intravascular blood results *immediately* in a gel constitutes a physiological integrity of the living being. Hemophilic blood differs from normal blood in that it is the least sensitive to extravascular changes and gels rather *slowly*. Hemophilic blood looks like normal blood and is like it in composition but it functions differently, the basis for which is independent of all other tissue functions of the body. The mechanism of hemophilia involves an alteration in the blood clotting function evaluated in terms of the clotting substances contained in blood.

Blood coagulation is clinically the conversion of dissolved fibrinogen by thrombin into insoluble stringy fibrin. This constitutes the clotting phase which is *normal* in hemophilia. But the preliminary period during which thrombin is formed is greatly *delayed* in hemophilia:

The first biochemical study was made by Sahli¹⁴ who found a decrease in cephalin both in the wounded tissues of the bleeders and in the formed elements of their blood. This observation was confirmed by Emile-Weil¹⁵ who showed that blood obtained by venapuncture from hemophiles remained fluid for several hours whereas that obtained by finger puncture clots more rapidly. This role of tissue products was further demonstrated by Morawitz¹⁶ who accelerated the clotting of hemophilic blood by addition of tissue extracts. Comparative tests with tissue extracts obtained from hemophilic and normal persons have shown according to Addis¹⁷ and Minot and Lee¹⁸ that the deficiency is in the formed elements of the blood rather than in body tissues of hemophiles.

Quantitative determination of the other substances necessary for blood coagulation have yielded variable results in hemophiles. Klinger¹⁹ found fibrinogen unaltered in quantity or in quality. Wohlisch²⁰ showed that the thrombin concentration is normal in hemophiles. Nolf¹² determined the blood calcium concentration in hemophiles and found it consistently normal. Repeated findings of normal concentration in those substances actively involved in the clotting mechanism have led to the inevitable conclusion that the defect in hemophilic blood is delay in the conversion of prothrombin into thrombin. All contemporary research has been mainly directed in elucidating the cause of this delay. Sahli²² demonstrated that the retarded clotting process was due to deficiency of thrombokinase. Feissly²³ found that the inhibitor substance, antithrombin, prevented thrombin formation. Howell²⁴ actually observed inadequacy in prothrombin.

The platelets of hemophilic blood have been found to be more stable than those of normal blood by Howell and Cekada²⁵. This slowness of platelet disintegration accounts for the delayed clotting in hemophilia. We have observed that the unwashed platelets obtained from hemophilic children were strikingly resistant to disintegration by contact with wet surfaces in comparison with those of normal children. Pickering²⁶ however found that addition of saponin (1:10,000) to hemophilic blood completely disintegrates the platelets but the blood nevertheless remained unclotted for thirty minutes. Blood platelets of hemophiles washed with isotonic saline disintegrate more rapidly than the unwashed platelets. This indicates that they are protected colloidal by plasma, the difficulty therefore being due to a

markedly stable blood plasma. We have attempted to correlate these findings in the present blood studies so that they may be utilized as additional diagnostic means in hemophilic problems.

Differential Diagnosis of Hemophilia. The question of hemophilia usually arises in a case of immoderate and uncontrollable hemorrhage or in a case of swelling of a joint. Every type of hemorrhage particularly epistaxis, hematoma and hematemeses must be examined for local causes and excluded before hemophilia is at all considered. These forms of bleeding are so common that it is easy to construct a pedigree showing an inherited hemorrhagic tendency and such families are extremely common in literature.

Demonstration of inheritance is essential for the support of the diagnosis of hemophilia without considering it to have arisen *de novo* in a particular case. The instances of probably hemophilia without demonstrated inheritance are comparatively few and would undoubtedly be still fewer if physicians had sufficient time, interest or perseverance to investigate beneath what might be immediately apparent on the surface.

It is further essential to establish that the patient has been more or less *subject to hemorrhages from various parts of the body*. No solitary hemorrhage, however, inexplicable should ever be regarded as hemophilia. It is necessary to show repeated attacks of bleeding from infancy. Diagnosis therefore depends on the family history, the occurrence of repeated bleeding, protracted and from several sites, joint manifestations and prolonged clotting time. Mild cases are rare and are not suspected until some accident or operation takes place.

In infants when as yet there has been no opportunity to observe a chronicity in the disease, diagnosis may be made by the very *low index of blood clotting function*. Umbilical bleeding unless at birth and in the presence of inheritance should receive no hemophilic consideration. In infants within the first week of life hemorrhagic disease of the newborn occurs. It is never familial and develops only in the first days of life when the hemophilic infant seldom bleeds. Hemorrhagic disease of the newborn occurs in either sex but never in hemophilia.

Hemophilia must be sharply differentiated from chronic purpura hemorrhagic which occurs in either sex and is neither congenital nor familial. In hemophilia the *physiologically defective* platelets are present in normal or increased numbers, the bleeding time is normal, the firm clot retracts but the clotting time is greatly prolonged. In purpura hemorrhagica the number of platelets *physiologically normal* is much decreased, the bleeding time is prolonged, the clot is non-retractile and soft and the clotting time is normal. Spontaneous bleeding and purpuric skin

lesions are evidence of purpura hemorrhagica and not of hemophilia.

Prolonged clotting is not pathognomic of hemophilia but occurs also in sepsis, jaundice, polycythemia and nephritis although not as marked as in hemophilia. Scurvy would hardly be mistaken for hemophilia. The blood is always found to be normal in scurvy, familial epistaxis, hereditary hemoptysis and hereditary hematuria.

Results.

The index of blood clotting function in hemophilia. The paucity of actual knowledge about hemophilia has led Immerman to come to the conclusion that the standstill is due to the fact that further discussion of the condition is without

profit until some method of diagnosis is devised that does not depend on outward symptoms. This we have found in the development of the methods for the determination of the blood clotting constituents, the data for which are given in Table I for true hemophilia.

The results show that hemophilic blood has a *prothrombin* concentration which is less than 1/3 of the normal content. This relatively low prothrombin content is compensated by a correspondingly high *antithrombin* concentration which is always more than three times the normal concentration. The *platelets* of the hemophilic blood are always normal in concentration and increased in number in hemophilia with joint manifestations. But the *platelet disintegration* value is always

TABLE I
THE CONCENTRATION OF CLOTTING COMPONENTS AND THE INDEX OF BLOOD CLOTTING FUNCTION IN HEREDITARY HEMOPHILIA

less than 33% in comparison with normal blood which is greater than 50% at the end of an hour from the time blood is obtained from the vein.

The index of clotting function constitutes the ratio of the concentration of the substances tending to clot over those tending to favor bleeding. Hemophilic blood is always characterized by a *clotting index* which is less than 1/10 of the normal or less than 0.05 in comparison with the normal of 0.5. Any blood whose index is less than 0.05 may be characterized as hemophilic as a laboratory diagnosis independent of the other criteria necessary for the diagnosis of hemophilia. No other hemorrhagic disease has thus far evinced a blood clotting index as low as that which characterizes hemophilia. The value of resorting to this laboratory procedure for the diagnosis of hemophilia is unparalleled by any other procedure because it is one *absolute criterion* for unmistakable diagnosis. We have been able by this means to rule out the presence of hemophilia in females of bleeder families or even in mothers of hemophilic boys. We have further been enabled to test the relative merits of therapeutic procedures advanced for hemophilia.

The differentiation of hemophiliacs from non-hemophiliacs by the index of blood clotting function. Bleeders of all kinds have come under our observation with the tentative diagnosis of hemophilia. A careful study of each case as indicated in this paper correlated with the determination of the blood clotting constituents has reduced the number to the few reported. The other cases have been liberated from the dread of the hemophilic label and particularly from the restrictions consequent upon the disease. These children have all shown a clotting index well within the normal range and have responded to nutritional therapy to the extent of alleviating the bleeding tendency and thus enabling them to undergo required operative procedures without surgical hesitation or needless parental fear.

The effect of transfusion in hemophilia. Whole blood injected intravenously from a donor of the same group is at present most effective in arresting bleeding. According to the data in Table II the index of blood clotting function is increased many fold following transfusion but blood determinations made daily have shown that this increase in clotting constituents lasts for only 48 hours. Repeated transfusions are necessary for the maintenance of a higher level of clotting function. No change in the clotting index has been observed in hemophiliacs with joint manifestations. All other bleeding occurring in the course of active hemophilia is very definitely benefited by transfusion.

The universal protection of the female from the bleeding deficiency that characterizes the male hemophilic has led several workers to utilize women donors. We have been unable to draw any

definite conclusions with regard to this procedure. We have however attempted to inject ovarian extract and preparations of the female sex hormone without observing any change in the concentration of the blood clotting constituents. The daily injection of these substances has not altered the index of blood clotting function in the least. While we believe that the introduction of blood not only contributes actual clotting substances to hemophilic blood to accelerate coagulation it also adds a hormone sex-linked in nature which may catalyze the synthesis of clotting compounds. We have adduced proof of this substance in the hemophilic.

The effect of diet in hemophilia. We have in a previous communication presented evidence that the dietary affects the level of blood clotting function. We have observed that the high protein diet increases the concentration of clotting substance in potential hemorrhagic disease, less so in frank hemorrhagic disease and not at all in hemophilia. The protein substances ingested in the daily dietary are utilized by the liver for the synthesis of the substances necessary for the blood coagulation. The innate deficiency in hemophilia is not in the availability of these substances but rather in the mechanism which converts these substances into the active clotting compounds. This constitutes a deficiency in the *primary stage of the clotting mechanism*. We have further observed that the conversion of protein substances is not catalyzed by the ingestion of any of the vitamins now known.

Treatment of Hemophilia.

Severe bleeding may be arrested most satisfactorily by *transfused blood* from a donor of the same blood group. It serves the dual purpose of replacing lost blood and of increasing the rate of blood coagulation. Whole blood controls the symptoms of hemophilia for a week. The degree of improvement depends upon the amount of blood given. Even small amounts (15-30 cc.) of transfused blood arrest hemophilia hemorrhages. Feissly²⁷ has shown that the retarded rate of transformation of prothrombin into active thrombin is brought to the normal rate within 30 minutes of the intravenous injection of blood. While the improvement is only temporary, lasting for two or three days it may be of sufficient duration to permit of surgical intervention.

Serum injected in a hemophilic is not very effective in controlling hemorrhage. But *fresh serum* from man, horse, or rabbit injected intravenously (15 cc.) or subcutaneously (30 cc.) brings the clotting mechanism to normal within 48 hours and maintains it at normal for a week. Weil²⁸ introduced the injection of fresh serum in the treatment of hemophilia. Nolf observed it to stimulate the formation of thrombocytes. We have found further that the injection of all other

sera proved ineffective. Sodium citrate injected intravenously or intramuscularly produces a transitory diminution in the clotting time but this is followed by marked prolongation of the bleeding time due to the destruction of platelets by sodium citrate.

Protein sensitization checks mild bleeding according to Vines²⁹. The non-sensitive patient is given 3 cc. horse serum subcutaneously. After 10 days he will usually be sensitive and should then receive about 0.2 cc. of the same serum intradermally. As the skin reaction becomes positive the coagulation time of the peripheral blood falls and if bleeding is in progress it will probably stop. The effect may last for weeks. The skin reaction does not desensitize the patient so that he is constantly ready to react to other intradermal injections of protein given to check further bleeding.

Locally the most effective coagulant in hemophilic bleeding is *fresh human blood* soaked in cotton wool applied after the removal of useless clots. Diokorides in the first century A. D. arrested bleeding with fresh bird's blood applied locally. When fresh normal blood is not available fresh human serum, tissue-juice extracts or fresh meat juice applied locally is also effective.

Cephalin checks bleeding when applied locally but has no effect when given by mouth or in subcutaneous or intramuscular injections. Neither have other coagulants now available any effect for the arrest of bleeding in hemophilia.

At best the disease is very refractory to treatment. Local applications are usually inefficacious in severe bleeding. Transfusion improves the coagulability of the blood only for a few days and even then it has little or no effect on effusions of blood into the joints. Various attempts have therefore been made recently to maintain a normal clotting mechanism by dietary measures. Though we have developed dieto-therapy in hemorrhagic disease,³⁰ we have found our so-called "clotting diet" ineffective in hemophilia.

Lopez³¹ observed that great improvement follows the use of diets rich in vitamins. Therefore Bayo³² gave a diet rich in vitamins and $\text{Ca}_3(\text{PO}_4)_2$ to a "hemophilic" boy of 12 years. His blood calcium arose from 5.7 mg% to 11.4 mg%. This low calcium bleeding condition was not hereditary hemophilia but hemophilia calcapriva (Wright). The calcium content of hemophilic blood is normal. Nevertheless, Llopez, a pharmacist of Madrid, patented "vitamin" tablets supposedly consisting of vitamin A, B, C and D as well as calcium phosphate and lactose as "specific" therapy for hemophilia. I have been unable to confirm this specificity or any benefit from this therapy in hemophilia. Nickau³³

describes clinical improvement in two hemophilic patients following administration of this Spanish preparation. The results are not convincing, for more than two hours were required for the blood to coagulate after treatment for six months.

The prevention of hemophilia is a problem of eugenics. The course of the disease cannot be fundamentally altered. Every effort should be made to guard the hemophilic child from traumatism. This limitation of bodily motion should be compensated by daily massage of extremities. The improved muscle tone thus becomes an effective barrier to vascular injury. The diet should be rich in visceral protein to make available the clotting substances for the blood and maintain optimum blood regeneration in case of hemorrhage. The child's blood group should be determined and a suitable donor kept available for *emergency transfusion*. In case of hemorrhage the child should be put at absolute rest and given morphine or its derivatives, if necessary. Tissue-juice extracts should be applied locally and transfusion given when the loss of blood becomes marked. This is to be repeated the third day to arrest hemorrhage and induce healing more rapidly. The hemophilic child may undergo surgical operation without hemorrhaging provided a large blood transfusion is given beforehand.

Conclusions.

(1). The criteria necessary and sufficient for the diagnosis of hemophilia have been formulated on the basis of experimental and clinical studies.

(2). Quantitative determinations of the constituents involved in blood coagulation show the hemophilic deficiency to be in the primary stage of the blood clotting mechanism.

(3). Hemophilic blood shows a strikingly low prothrombin content compensated by a correspondingly high antithrombin content. The platelets are normal in number but are physiologically defective having a slow rate of disintegration.

(4). Hemophilic blood is characterized by a blood clotting index which is less than 1/10th of the normal. The index constitutes the ratio of the concentration of the substances tending to clot over those tending to favor bleeding. Accordingly the normal index of clotting function is 0.5 whereas the hemophilic clotting index is less than 0.05. The very low index of blood clotting function is absolutely diagnostic of hemophilia.

(5). The index of blood clotting function is increased many fold after transfusion but the improved clotting lasts for only 48 hours. Transfusion does not alter the clotting function of blood in hemophiles with joint manifestations.

(6). Dietary protein, lipids, vitamins or minerals do not alter the deficient clotting function in hemophilia.

(7). Hemophiles show the absence of the fe-

male sex hormone in their tissues Ovarian therapy, Theelin, etc produce no change in the hemophilic clotting mechanism

(8) Serum injected and applied locally is not effective in controlling hemorrhage in hemophilia unless it be fresh and rich in thrombin But non-hemophilic bleeders respond rapidly to any serum and to dietotherapy

PRACTICAL POINTS ON THE MICROSCOPIC GRADING OF CARCINOMA*

By ALBERT C BRODERS, M D, SECTION ON SURGICAL PATHOLOGY, THE MAYO CLINIC, ROCHESTER, MINN

IT is well known that pathologists for a long time have appreciated, in a general way, the possibility of detecting the varying clinical malignancy of carcinoma by microscopic examination However, it is only in recent years, through careful study of carcinomatous cells, that concrete knowledge of practical therapeutic and prognostic value to victims of carcinoma has been obtained

Older clinicians and surgeons fully appreciated the fact that different types of carcinoma varied in clinical malignancy, for example, melanotic carcinoma was known to be more malignant than basal cell carcinoma They were also fully aware that carcinomas of the same type, in different situations, differed in clinical malignancy, thus, the average squamous cell carcinoma of the uterine cervix was known to be more malignant than the same type when situated on the lip However, when it came to carcinomas of the same type, in the same situation, there was no general appreciation of variation in clinical malignancy, a carcinoma of the lip was considered a carcinoma of the lip and a carcinoma of the stomach a car-

cinoma of the stomach, and nothing more Experienced physicians, however, had observed that papillary, polypoid, or elevated carcinomas were less malignant than those that were flat or infiltrating This observation was fully appreciated by the late Dr W W Mayo when he said, "A cancer that comes to you is less malignant than one that goes away from you"

It is generally held that carcinoma of youthful persons is more malignant than that of aged persons As a whole, this appears to be true However, when it comes to comparing the grade of malignancy of carcinoma of youthful persons with that of middle aged persons, I am of the opinion that there is practically no difference If a man, twenty five years of age, becomes a victim of a rapidly growing carcinoma of the lip, with fatal termination in a short time, the rapidity of growth and fatal result are usually attributed to the youth of the patient, on the other hand, if a man of fifty years is the victim of the same kind of rapidly growing neoplasm, in the same situation, and there is a fatal termination in short order, no explanation relative to age is forthcoming The difference in malignancy of the same type of carcinoma in different situations is often

FIGURE 1

Epidermoid carcinoma of the skin, grade 1, in which the cells for the most part have differentiated to the point that reproduction has been reduced to a minimum with only slight evidence of formation of pearly bodies.

FIGURE 2

Adenocarcinoma, grade 1, in an adenoma of the rectum. This is an example of a short range dedifferentiation and differentiation in a glandular neoplasm, similar to that seen in basal cell carcinoma of the skin.

FIGURE 3

Epidermoid carcinoma of the skin, grade 2, in which cells are undergoing keratinization without the formation of pearly bodies.

FIGURE 4

Adenocarcinoma of the breast, grade 2. The nuclei are small, regular and hyperchromatic; acini are not as clearly defined as in figure 2.

FIGURE 5

Epidermoid carcinoma of a submaxillary lymph node, grade 3, secondary to carcinoma of the lip. There are pale, oval nuclei with prominent nucleoli in spindle-shaped cells.

FIGURE 6

Adenocarcinoma of the rectum, grade 3, in which the acini are ill-defined, the nuclei irregular, and large in proportion to the cytoplasm.

FIGURE 7

FIGURE 8

explained by a difference in blood and lymph supply. As far as my experience goes, this explanation is inadequate. The high average of malignancy of squamous cell carcinoma of the tonsil, nasopharynx, posterior half of the tongue, esophagus, vagina, and uterine cervix, as compared to the lower average of malignancy of the same type of carcinoma of the anterior half of the tongue, buccal surface of the cheeks, lips, skin, penis, and labia, most certainly cannot be explained by a difference in blood and lymph supply. Neither will this explain the difference between the high average malignancy of adenocarcinoma of the breast and stomach on the one hand, and the lower average malignancy of adenocarcinoma of the large intestine and body of the uterus on the other hand, nor the high average malignancy of melanotic carcinoma of the skin, and the lower average malignancy of basal cell carcinoma of the same tissue.

In prognosis of malignant tumors in general, it goes without saying that well informed physicians take into consideration a number of factors; however, I do not hesitate to state that the grade of malignancy is by far the most important one. As a rule, the grades of malignancy of carcinomatous neoplasms are in direct proportion to their proliferative, infiltrative, metastasizing and death-dealing capacities. The chief difference in the malignancy of different tumors, or tumors of the same type, depends on their cellular activity. If the cells of a carcinoma are active, as a rule, its clinical malignancy is in keeping with this faculty.

In the early part of the last decade of the nineteenth century, Hansemann presented a clear conception of the cytogenesis of carcinoma. He showed that through a process of dedifferentiation, or what he termed "anaplasia" (backward formation), epithelial cells could undergo malignant transformation. In other words, the functioning quality of the cell is sacrificed or decreased, whereas the reproductive or proliferative quality is increased. At the inception of some carcinomas, the basal cell type for example, dedifferentiation of the cells is only slight; hence, these cells would have to differentiate only to a slight extent before they reached a state that compared favorably with the normal basal cells. A similar condition prevails in adenocarcinomas graded 1 that originate in adenomas. Such carcinomas are of a low average of malignancy. On the other hand, the cells of a carcinoma that arises from cells which have undergone marked dedifferentiation, would have to differentiate to a great extent before they reached a biologic state of development comparable to that of normal cells. The cells of such a carcinoma are highly malignant, and are well exemplified by those of nonmelanotic melanoepithelioma. Carcinomatous cells of a given neoplasm usually remain about the same throughout the course of the disease. Sometimes they increase in activity; then again, they

may decrease in this respect. Since the grading of carcinoma is based on the fundamental principle of cellular differentiation, it is very important for the microscopist, especially in examination of early lesions, fully to appreciate the extent to which the carcinomatous cells are deviated from the normal, or in other words, the extent of dedifferentiation or anaplasia.

A completely differentiated cell of an epidermoid carcinoma is one in which the entire cytoplasm is keratinohyalinized, or keratinized, and the nucleoplasm has become eccentric and degenerated. Such cells may be arranged in a discrete manner but are usually conglomerated in the form of pearly bodies. I believe one can say that they have reached a state of absolute differentiation, in other words, have arrived at a point where they can neither dedifferentiate nor reproduce; Hansemann would say that they have gone to their physiologic death. At this point, it might be well to call attention to the fact that keratin forms the basis of all horny tissue, such as the stratum corneum of the epidermis, finger nails, toenails, hoofs, horns, hair, feathers, scales of fish, and so forth.

In a partially differentiated cell of an epidermoid carcinoma, the cytoplasm is not completely keratinohyalinized or keratinized. The cytoplasm is usually disproportionately large in volume in comparison with the nucleoplasm, which often appears actually to have decreased, so that it is not more voluminous than the nucleolus observed in some cells of the same type of carcinoma. In this cell, the nucleoplasm usually appears as a small, spheroidal or oval mass, situated about the center of the cytoplasm, and it does not show evidence of encroachment and degeneration. Such a cell has differentiated to the point that its reproductive capacity is reduced to a minimum. The production of melanin in melanocarcinoma is evidence of differentiation, just as is the production of keratin in epidermoid carcinoma.

The range of dedifferentiation and differentiation in basal cell carcinoma is usually slight. The cells of a basal cell carcinoma not infrequently partially or completely differentiate toward the epidermoid type, as manifested by keratinization and formation of pearly bodies. Conversely, they may partially differentiate in a glandular direction; however, for the most part they retain the characteristics of basal cells.

The partially differentiated cell of an adenocarcinoma has a spheroidal, oval or spindle-shaped nucleus, usually situated at the base of a columnar or cuboidal cell, and as in the epidermoid carcinoma it is relatively small in comparison to the cytoplasm. The cytoplasm of such a cell may or may not contain a secretory product. If the cell has reached a state of complete differentiation, the nucleoplasm not infrequently will have disappeared, as seen in mucoid adenocarcinoma.

In contrast to partially and completely differen-

tiated cells, it is also necessary, for the accurate grading of carcinoma and other malignant neoplasms, that the microscopist be familiar with cells that are in a partially or completely undifferentiated state. These cells vary in their degree of undifferentiation depending on the extent of differentiation. Cells in a state of mitosis or amitosis may be said to be in a state of partial or complete undifferentiation. Since irregular or atypical mitosis, in which the chromatin is arranged in a multipolar manner, that is in "Y," star, and cross formations, and so forth, is usually associated with carcinomas and other neoplasms of a high degree of malignancy, it is safe to infer that these forms represent a state of extreme undifferentiation. Cells with large spheroidal, or irregular nuclei, with or without prominent nucleoli, in which the cytoplasm is decreased and the nucleoplasm increased in volume, are familiar examples of undifferentiated forms. The nuclei of undifferentiated cells frequently have marked avidity for the basic dyes.

It is the aim of the microscopist, in the grading of carcinoma and of other malignant neoplasms, to estimate the proportion of cells that are partially or completely differentiated on the one hand, and those that are more or less undifferentiated on the other. The results are expressed in numerals from 1 to 4, as follows: A carcinoma graded 1 is one in which the proportion of differentiated cells ranges from almost 100 down to 75 per cent, that of the undifferentiated cells from practically 0 up to 25 per cent; in a carcinoma graded 2, the proportion of differentiated cells ranges from 75 down to 50 per cent, that of undifferentiated cells from 25 up to 50 per cent; in a carcinoma graded 3, the proportion of differentiated cells ranges from 50 down to 25 per cent, that of the undifferentiated cells from 50 up to 75 per cent, and in a carcinoma graded 4, the propor-

tion of differentiated cells is from 25 per cent to practically 0, that of the undifferentiated cells from 75 up to 100 per cent.

At this point I should like to state that as a rule there is practically the same grade of malignancy throughout a carcinoma. It is rather difficult to define the border between two grades, and if one is in doubt as to whether a carcinoma is of a lower or a higher grade, it is best to put it in the latter. It is not the rule to find characteristics of a low grade 1 carcinoma in one part of a growth, and characteristics of a high grade 2 carcinoma in another part; it is equally unlikely that the grade will be 1 in one part and 3 in another. Frater found practically no exceptions to the rule in carcinoma of the urinary bladder. Certain adenocarcinomas have been exceptions, but the percentage is so small that its influence is practically negligible.

REPORT OF A CASE OF BACTERAEMIA CAUSED BY THE MICROCOCCUS CATARRHALIS FOLLOWING TONSILLECTOMY AND ACUTE POLYARTHRITIS, WITH RECOVERY

BY STEPHEN H. CURTIS, M.D., TROY, N. Y.

From the Leonard Hospital Laboratory

THE *Micrococcus Catarrhalis* is found frequently in the throat and nasopharynx and being morphologically similar to the meningococcus, it is necessary to differentiate. It may inhabit the tonsillar cripts and give no rise to symptoms. It is not ordinarily considered very pathogenic but under certain circumstances it may become so. It has been found by many observers in the sputum and tissues of cases of bronchitis, pneumonia, whooping cough and other affections of the respiratory tract. It has often been reported in association with the influenza bacillus. It has been found in cases of epidemics simulating influenza and in multiple abscesses by Jordan¹ and reported found in infectious dermatitis by Lyon and Wherry.² It grows readily in ordinary nutrient media. Its occurrence in the blood stream giving rise to septicæmia is not common, hence it was thought advisable to report the following case.

This case was seen in April, 1928, a male 48 years of age, physician. He was unable to leave the bed. The temperature was 103, pulse 110, respirations 28. The elbow joints, knees and ankles were markedly swollen and painful. The joints of the fingers and hands were also involved but to a lesser degree. A history was obtained of the onset about three months previously of some joint involvement which had progressed to a point where the patient sought medical advice. Up to this time there had been very little, if any, rise in temperature. Finally a tonsillectomy was performed. Two days later the temperature rose, the arthritis became worse. Three weeks later the patient was first seen by us.

Physical Examination. The physical examination revealed a patient in great pain and prostration. The throat was inflamed and painful. As stated above, there was an acute inflammatory involvement of many joints. The lungs were negative. The heart rate was 110, the rhythm was regular. The first sound was short and rather indistinct. There was a soft systolic murmur heard over the apex. No friction rub was noted. Several petechiæ were noted on the chest and abdomen. The liver and spleen did not appear enlarged. The abdominal contents were likewise not remarkable.

The prostate gland was enlarged but soft. Smears of the prostatic secretion showed an abundance of lecithin and were negative for gonococci. No lymph nodes were palpable. Neurological examination was negative.

Laboratory Findings. The blood count showed a hemoglobin of 60%, red blood count of 2,680,000 and a white count of 20,000. The differential white count revealed 90% of polymorphonuclears and 10% of lymphocytes and other cells. The Wassermann reaction was negative. The urine showed a trace of albumin and small amounts of cellular elements. A blood culture was made on nutrient dextrose broth and also on nutrient dextrose agar. A growth was obtained which proved to be a gram negative coccus. Subsequent transplants were made and the organism grew readily. It did not ferment any of the sugars. Agglutination tests were made with an antimeningococcus serum which were negative. Agglutination tests were then made with an antimicrococcus catarrhalis serum which produced a complete agglutination in 1-5000 dilution. A diagnosis was made of acute polyarthritis, acute endocarditis and bacteræmia of micrococcus catarrhalis origin. Incidentally, throat cultures also yielded the same organism.

Treatment. The patient was treated with intravenous injections of sodium iodide and small doses of neosalvarsan alternately. Salicylates and the cinchophenic acid preparations were administered by mouth. After a slow insidious course and an equally slow convalescence, the patient recovered. His heart condition is cleared up, he has some limitation of motion of the involved joints but no pain and he is again attending to his practice.

Conclusion. This case indicates that the micrococcus catarrhalis, while seemingly to possess little virulence, may do so under favorable circumstances. It further indicates that tonsillectomy performed in the presence of an acute inflammation may afford an avenue of entrance of the infecting organism into the blood stream.

but in every instance referred it back to its committee for further study. The physicians of New York State realize that medical problems are to be approached by the case method, in which a full examination of the patient must precede diagnosis and treatment. The officers and committees will be busy if they do nothing more than study the problems assigned to them by the House of Delegates.

CHAS. GORDON HEYD, M.D., PRESIDENT

Dr. Chas. Gordon Heyd brings to the presidency of the Medical Society of the State of New York a broad experience not only in the practice of scientific healing, but also in the adjustment of the relations of the medical profession to other civic groups.

He is first of all a surgeon in active practice, familiar with both its operative and its teaching phases, and equally at home in the wards of a great hospital and his private office. His practice of surgery is the door through which he enters the field of administrative medicine as he seeks workable methods of solving the relations of the medical profession to those civic groups which supplement the work of the family doctor.

Dr. Heyd's influence as a medical teacher radiates from the New York Post-Graduate Medical School, in which he is Professor of Surgery.

His influence in the standardization of specialists is centered in the American College of Surgery, in which he is vice-president elect.

His services in the practice of civic medicine are evident in the Medical Society of the County of New York, in which he has passed through the chairs of office to become the President and then a Trustee.

Dr. Heyd's quickness of decision and devotion to duty are reflections of his army service in France with the A.E.F. as commanding officer of Mobile Hospital Number One. These characteristic qualities will assure him success as President of the Medical Society of the State of New York.

POLICIES FOR 1932

An inaugural statement by the President of the Medical Society of the State of New York

The world depression and the universal depreciation of social and financial values render it imperative for the Medical Society of the State of New York to consider seriously its program of activity, and to devise and formulate a constructive policy for the future.

Problems, State-wide and Local: There is a widespread tendency to believe that more and more centralization of medical authority should be placed with the officers of the Society. There is much to be said on centralization of authority, but on the other hand there are very serious difficulties to be encountered. A knowledge of the varying and diverse social, medical and financial conditions of the component medical societies demonstrates that no two counties present exactly the same type of problems. It is reasonable to suppose that in the matter of collecting doctors' fees, establishing a working schedule of fees in compensation cases, the interrelationship of private, semi-public and public hospital practice, there are present in the large urban sec-

tions problems that do not obtain in more rural districts. The State Society can most effectively promote the welfare of its membership by applying all of its energies to problems that are universal to its membership, such as legislative enactment and proposed laws, and other details of legislation that have to do with all types of medical practice. Malpractice insurance, indemnity insurance, and legal protection are purely universal functions of the State Society. The contact of the profession with the public, the social relations of medicine, and all those affairs that spring up between organized medicine on the one hand and society on the other, can be most effectively considered and action taken by committees of the State Society. It would seem, however, that the local component societies should have a larger measure of autonomy. They certainly have the ability to settle most of the problems that are peculiar to their population and geographical situation. For example, it would seem wise to leave the mat-

ter of financial agencies, collection bureaus, and professional economic services to be dealt with entirely by the local societies. It would seem unwise for the State Society to attempt to pass upon any general financial set-up that would be applicable to the State membership as a whole.

Economies in Administration It is incumbent upon the officers of the State Society to practice, preach, and exercise economy. The needless and repetitive expense of many meetings, at widely separated points, should be curtailed to the number necessary to accomplish their object without unduly spending the money of the Society. Functions that now reside in one, two, or more committees might after proper study be centralized in the hands of one committee or subdivision of a committee. In the revised Constitution and By-Laws the machinery has been set up for a referendum by mail, rather than by the costly and extraordinary sessions of the House of Delegates.

Medical Publicity: In the matter of publicity, conditions necessarily vary between more or less circumscribed small local societies and the societies of the five boroughs of New York. New York City with its tremendous broadcasting facilities presents constant opportunities for the profession to appear before the public and to undertake constructive and worth-while educational work. The proper allocation of time and selection of speakers, can be delegated to the Committees on Publicity of the local societies, who by experience and contacts have developed effective methods for medical publicity.

Medical Economics: The period that we are passing through is one in which every member of the community is bearing a share of the economic load. It would indeed be surprising if medicine did not participate in the economic depression. It would be found more surprising if medicine did not suffer more than some of the other professions. From time immemorial the remuneration of the doctor has been the last thought in the minds of the community, either collectively or individually. The present time is likely to produce a type of legislative mind that will want a law passed to provide for universal health insurance or State controlled medical service, or for an increasing intrusion of the State into medical practice. Therefore, it behooves the officers of the State Society and the chairmen of the various committees to be sensitive to any prospective legislative change that has for its object an increase in governmental paternalism. In order to be effectively prepared against such type of legislation it would seem wise for the State Society to engage in a very serious study with the idea of devising a plan capable of rendering a complete medical service to the community. The fundamental conception of such a plan would be that the professional side of the

service must remain in the hands of the organized medical profession. Furthermore, that all matters embracing the professional side of the practice of medicine which may arise in the future should be submitted to the organized profession for consideration and approval.

While we are laboring under economic disabilities at the present time, there is ample opportunity for the State Medical Society to plan a militant, progressive, forward-looking policy that will maintain the physician in his professional place, that shall remove from the practicing physician many of the handicaps that abound in the field of medicine today, and that will undertake definite measures for the control and coordination of the increasing clinic and institutional care of the sick. The Society should set up as part of its unalterable program the basic right of every physician to be remunerated for his time when he is employed in taking care of the indigent sick of the community. In short, the physician must be paid for his services at all times under similar conditions that obtain in other similar professions. The doctor is entitled to a monetary return for his labor that is fair and commensurate with his services, training, and experience. The fact that the practice of medicine is a profession does not mean that the doctor shall continue to work under a system that is ethically wrong and economically unsound. He must be paid for his services in order to function as a useful and contributing member of society.

The Medical Society of the State of New York should accept as a fundamental fact that all doctors working in dispensaries—public, private, or corporate—dealing with medical service, shall be paid a fair remuneration in keeping with their education, experience, and services.

Certification of Specialists: What is to be the policy of the State Society in regard to the certification of specialists? Should the Society seriously consider setting up standards and devising proper measures of control so that there may be an adequate evaluation of those claiming specialistic training, or those who set themselves forth, by inference or listing, as specialists? It would seem wise that the grading and certification should be done by organized medicine and not by the State. The State Society can bring to this problem adequate knowledge and organized control; and by reason of its experience, the machinery for doing the work.

There are many other matters of fundamental importance that are pressing for solution. Your newly installed officers enter upon their duties with a firm resolve to consider all of these matters dispassionately and fairly in an attempt to work out a plan and program that will be civically just, economically fair, and socially constructive.

CHARLES GORDON HEYD, M.D.

MEDICAL SOCIETY LECTURES TO STUDENTS

The Committee on Public Relations of the Medical Society of the State of New York has sponsored a series of lectures to the Fourth Year students of the medical schools of New York State. The subjects of the lectures are two-fold:

1. To bring the medical societies prominently to the attention of the medical students.

2. To inform the students of the responsibilities which will devolve upon them as community advisors in public health when they begin to practice their profession.

When the medical student graduates, the County Medical Society will become his medical school, his fraternity, and his business club.

The county society will offer him courses in the practice of administrative medicine, as the society exercises its prerogative of being the advisor to the community in all matters relating to public health.

The Society will offer him comradeship and the opportunity to associate with congenial friends who are bound together with ties of a common service to the community.

The Society will also inform him regarding medical economics so that he may discharge his medical obligations to the people, and the people or community may discharge their economic obligations to him, to their mutual satisfaction. Medical economics affect on the one hand the individual doctor and the medical profession, and on the other the individual that is sick and the community of which he is a part. The recognition and attempted solution of problems of medical economics are new activities, whose diagnosis and treatment belong to county medical societies. The recent graduate, untrained and inexperienced in these problems, but suddenly con-

fronted by them in his individual practice, is likely to meet them either with the cold methods of the business man, or else the impractical charity of the missionary who is dominated by an unreasoning pity for the unfortunate. The County Medical Society offers to the recent graduate the opportunity to orient himself in his economic relations to the people and to his medical brethren.

The Medical Society of the State of New York has recognized its obligation to those about to begin the practice of medicine, and has assigned one of its Past Presidents, Dr. William H. Ross, to address the senior classes in the nine medical schools of the State. The students have received the instruction with deep interest, and the Deans of the Schools have expressed their appreciation of the lectures.

The opportunity and obligation of medical societies to instruct medical students have been recognized and attempts to reach them have been made. The annual report of the President of the Illinois State Medical Society to the House of Delegates in 1930, abstracted in this Journal of September 1, 1930, page 1062, outlines the work of the State Society in organizing a medical student advisory committee for the purpose of arranging lectures to students and interns the subjects of organization, economics, and ethics.

The annual report of the Committee on Medical Economics of the Oklahoma State Medical Association, abstracted on page 705 of this Journal, refers to a course on Practical Economics given to the dentists of Oklahoma under the State Dental Society, and describes some investigations which led to the proposition that the State Medical Association shall institute such a course of lectures.

LOOKING BACKWARD

This Journal Twenty-five Years Ago

Air Massage: Physical therapy is older than medicine itself, but its practice as a specialty has been developed in recent years, after many procedures had been tried, and only those having a scientific basis survived. This Journal of June, 1907, contains a brief extract from a German journal describing what is called "Air Massage" as follows:

"R. Klapp produces the effects of massage without the necessity of touching the parts by directing strong currents of air on the skin. These strong currents produce hyperemia. To

produce a reaction of the hyperemia, which is produced by a cold stream of air, a short application of a hot stream is necessary. The treatment is useful in painful affections, such as recent fractures, in macerated conditions of the skin in the neighborhood of wounds. Infiltrated areas are caused to be absorbed more rapidly. Klapp uses an apparatus constructed by Eschbaum which is capable of producing as strong a current of air, either hot or cold, as is necessary.—*Münchener med. Wochenschrift*, 1907, No. 1."

MEDICAL PROGRESS

The Influence of Experimental Asphyxia Upon the Heart.—Experimental studies with reference to the mechanism of insufficiency of the right ventricle carried out by Ch. Laubry, J. Walser and L. Deglaude convinced these authors that mechanical factors, to which the classic doctrine has attributed this insufficiency play only a secondary role, the primary factor being myocardial hypotonia. Their method was to produce conditions of artificial respiration by opening the pleura in rabbits and hooking electrodes transversely into the muscular wall above and below the thoracic opening, under intraperitoneal anesthesia. They could thus control the respiratory movements, and interrupt them at will. They observed under asphyxia a marked dilatation of the heart, chiefly affecting the right ventricle, this always appeared at the same period of the experiment, and was accompanied by a cyanotic color in the cardiac muscle and a distention of the superficial venous network of the muscle, engorged with blood. There were also changes in the heart rhythm a retardation, followed by a phase of arrhythmia, and a progressive weakening of the ventricular contractions, which gradually became imperceptible while the auricles continued to beat. Leucocytes were markedly increased in number, and erythrocytes to a less degree. The electrocardiogram showed the following anomalies: (1) Increased amplitude of the R wave, sudden and transitory, which may be considered an exaltation of excitability, (2) Enlargement of Q R S, related on the one hand to cardiac dilatation, and on the other to troubles of electrical conductivity due to faulty nutrition of the myocardium, (3) prolongation of the P-R space, probably related to insufficient oxidation, the role of which is primordial in the muscular physiology, and (4) inversion of the T wave, showing the extension of the insufficient oxidation to the contractile process.

It seems probable that all these troubles were due to defective oxygenation of the myocardium, inducing a state of hypotonia. Applying this conclusion to human pathology, it is reasonable to conclude that grave cardiac attacks resulting in sudden death may in many instances be due to the same acute hypotonia and cardiac distention which have been observed during these experiments. It is also probable that transitory functional troubles provoked by an attack of asphyxia do not altogether regress, but leave the myocardium more vulnerable in their wake.—*Bulletin de l'Academie de Medecine*, March 8, 1932

The Practical Significance of Arterio-atony in the Development of Arteriosclerosis.—J. Plesch, writing in the *Deutsche medizinische Wochenschrift* of February 26, 1932, presents the view that arteriosclerosis is only one aspect of a constitutional systemic disease, which affects particularly the smooth musculature, and attacks simultaneously the entire vascular system, not merely certain parts of it. Local changes, to which medical science has given names (atheromatosis, hardening of the arteries, etc.) only serve to strengthen the overdilated wall at the points subjected to the greatest demands. Although deposition of calcium in the arterial wall is found at all ages in a surprisingly large number of subjects, this is not the essential thing in arteriosclerosis, but is a secondary phenomenon. The primary cause of the affection lies in the weakening of both the muscular and the elastic elements of the vessel walls. If the relaxed vessel cannot offer sufficient resistance to the blood pressure, it becomes stretched and dilated. At those places that are most exposed to the dynamic pressure changes appear, which in the last result only serve to increase the resistance of the vessel wall—a process which offers a defense against bursting and rupture. Calcification and hardening do not therefore constitute a disease, but a process of healing. Microscopic preparations show that even those parts of the arterial wall that are macroscopically unchanged are in reality pathologically changed, thus proving that the disease is not local but systemic. Every influence that tends to weaken the organism in such wise as to produce general atony is responsible also for the appearance of arterio-atony. Arteriosclerosis is not peculiarly an old age disease, it may appear in youth and later come to a standstill, or may rapidly produce very grave disturbances, ending in death, whereas calcification setting in in late years of life scarcely leads to serious consequences. Autopsies of strong young soldiers killed in the war revealed surprisingly many individuals with arteriosclerosis. On the basis of blood pressure curves, four types of vessels are recognizable: (1) the sound and tonic, (2) the completely atonic, (3) vessels that are atonic in places and rigid in others, (4) those that are tonic in places, and rigid in other places. When in artery ruptures, the tear scarcely ever occurs in the calcified spot but in the place of transition between rigidly calcified tissue and atonic tissue. Every arterial spasm must have been preceded by an overdilatation in a vascular region. Tortuosity of the temporal artery constitutes an in-

dex-of-arterio-atony. Atony of longitudinal elements has a more favorable prognosis than that of transverse elements. Treatment consists in regulation of blood pressure, reduction of blood mass (which is excessive), and in measures directed toward symptoms as they arise.

The Etiology of Acrodynia.—Although the cause of acrodynia is not definitely known, reports appearing in the literature indicate that the theory that it is a deficiency disease is rapidly becoming the prevailing opinion. Harold T. Nesbit describes a case which affords further support to this theory. The patient, a 17 months old girl, when first seen was in a condition of marked inanition. She had been treated by one physician for stomatitis because of ulcerations in the floor of her mouth, and by another for tetany. She presented the typical symptoms of acrodynia—edema and redness of the fingers and toes, and marked photophobia and conjunctivitis. A careful physical and laboratory examination excluded other diseases. A diet was prescribed consisting of milk, whole grain cereals, brewer's yeast, and vegetables. In addition ultraviolet radiation was given three times daily and cod liver oil. As the child refused all food except cereal, gruel, and milk, brewer's yeast and spintrate were added to these. Thus an ample supply of calories, vitamins, and minerals was provided without the use of gavage so frequently necessary in these cases. The response to this diet was striking. Within four days the skin manifestations had completely disappeared, the sweating had lessened, and the child began to have restful sleep for the first time in six weeks. During the second week the improvement was so marked that fruit juices, eggs, and simple desserts were added to the diet. Progress was so rapid that the child was permitted to leave the hospital in two weeks and went on to complete recovery. As cod liver oil and milk had previously occupied a place in the child's diet, ultraviolet light, brewer's yeast, spintrate or cereal, either one or all, must have been responsible for the result. Although the quartz light therapy undoubtedly reinforced the abundant vitamin D, it is plausible to believe that the other three elements, each containing vitamin B in large amounts, provided the rapid convalescence in this patient. As Zahorsky and McClendon have noted marked improvement by the addition of brewer's yeast to the diet, vitamin B deficiency should receive further consideration as an etiological factor in acrodynia.—*Archives of Pediatrics*, March, 1932, xlix, 3.

Immunotransfusion in Septic General Infections.—Long cases of severe septic generalized infection described by Knut Hallberg, cured by immunotransfusion at

the surgical clinic of Upsala, with encouraging results. This treatment, conceived by Wright in 1919, consists in combining blood transfusion with serum therapy, by inoculating the donor with staphylococcus vaccine in advance of making the transfusion. It appears that the method is not even yet so well known as it deserves to be. Two of the four patients in question had already been given ordinary blood transfusion, which proved valueless. All four were in very grave condition. A mixture of antitoxic scarlet fever serum and antistreptococcus serum in equal parts had no more effect than the mercurochrome and trypanflavine injections that were tried. Only when immunotransfusion was employed did the condition of the patients begin to improve. Autovaccines were prepared in all cases from the blood or from a metastatic focus, and were administered to the prospective donors in 3 successive doses of respectively 100, 200, and 400 million bacteria, with the exception of one case in which only one dose of 100 million was given. The transfusions were made 2 to 24 hours after the last injection had been given. In no case was any discomfort to the donor observed, and the treatment was successful in all cases. Two of these patients were men, and two were children, a girl of 10 and a boy of 3. A comparison of the deplorable condition of this boy on the morning before the transfusion and his improved condition only a few hours after the transfusion left no doubt as to the value of the treatment. Despite pyarthrosis in three joints the sepsis cleared up so rapidly that in three weeks his temperature was normal and he was discharged cured two weeks later. Donor and recipient should belong to the same blood group, as was the case in all these instances. A favorable sign observed in all the cases was that after the immunotransfusion the septic process became localized. The fall of temperature was by lysis. In addition to the immunotransfusion, one patient received injections of autovaccine, but in smaller dose than that given the donor. In urgent cases where there is no time to prepare an autovaccine, stock vaccines may be used.—*Acta Chirurgica Scandinavica*, March, 3, 1932.

Calcified Bursitis.—On the basis of a personal case, interesting from its unusual localization in the subtricipital region, and from its clear roentgenological image, Edouard Naz and Silvije Kadrnka discuss certain features of calcified bursitis. This bursolith, the size of a small egg, first observed on the occasion of a traumatism, appears to have been the result of the occupation of its bearer, a young girl who had for several years rung the bells of her village church. The subtricipital bursa is not preformed, like many bursae, but develops

in postnatal days, depending on the habitual use of the locomotor apparatus. In this location the bursa forms a sort of cushion between the humerus and the tendon of the triceps. In certain cases of bursitis inflammatory hyperplasia leads to a twofold process of proliferation and destruction, accompanied as here, by a deposit of calcareous salts in the necrosed parts (calcifications). Other parts, pedunculated and calcified, may become detached (crucious concretions) and become free within the interior of the bursa. When multiple concretions are present in a bursa they finally block its lumen, and it becomes transformed into a calcified mass. The radiological characters of these bursoliths vary according to the stage of calcification, and are closely allied to those of the anatomic variety of the bursa in question. The calcium salts are deposited irregularly in the walls of the capsule and in the fibrous furrows which traverse the structure. There may be only a slight cloudy contrast shadow, but at a more advanced stage veritable calcareous blocks are formed, which become detached and remain free within the bursa. At a still more advanced stage, scarcely any vital tissue remains, and there is no liquid content in the bursa. The radiologic image consists of multiple shadows closely imbricated with one another, and of varied size and form. They are separated by narrow, less opaque bands (noncalcified tissue) and form an image resembling a bunch of grapes. The degree of opacity is nearly that of the cortex of the bone. The localization and image in the authors' case impress the need of prudence in the diagnosis of affections of the elbow accompanied by ossifying or calcifying hyperplasia and especially in diagnosing chondromatosis of the capsule, a number of cases of which have been recently described without anatomic verification—*Lyon chirurgial*, January February, 1932.

Conditioned Reflexes and Habit Formation

—Starting with Pavlov's statement that habits are nothing more than a long chain of conditioned reflexes, W. Horsley Gantt shows how the teaching of conditioned reflexes for habit formation supports the rules for habit training formulated by William James. The first of these rules is "*We must make automatic and habitual, as early as possible as many useful acts as we can*." This means we must elaborate conditioned reflexes to the proper stimuli or situations (complex stimuli) and as early as possible, because young animals form them more easily than older, and the first reflexes are the strongest. James' second rule is "*Launch ourselves on as strong and decided initiative as possible*. Accumulate all the possible circumstances which will reinforce the right motives." Here emotion is brought into play, and a cer-

tain emotion is necessary for the elaboration of conditioned reflexes, a dog which is not hungry will not form a conditioned food reflex. The third rule laid down by James is: "*Never suffer an exception to occur until the new habit is securely rooted in your life*." The extinction of the conditioned reflex may easily occur when the conditioned stimulus is given too often without supporting it by the unconditioned. James' third rule of "*Keeping the faculty of effort alive in you by a little gratuitous exercise every day*" involves both the emotional state and the value of repetition in the elaboration of conditioned reflexes and in the prevention of their gradual spontaneous extinction. In addition to these maxims Gantt makes several direct applications from the study of conditioned reflexes to habit formation. After the first conditioned reflex in a certain center is elaborated it takes fewer trials for each succeeding one up to a certain point. This is a basic law of education. That extinction of the second conditioned reflex is much easier than of the first, and that when once it has been extinguished and restored it is never so stable as it was before extinction, has an enormous significance in the destruction of moral codes. It explains why a person unworthy in one thing is usually so in another, the chaos produced by revolutions and wars, the difficulty of bringing about permanent cures in drunkards, culprits, etc. How strong the old conditioned reflexes are and their spontaneous restoration after extinction, and how quickly recently elaborated conditioned reflexes disappear, is seen in the readiness with which habits cultivated late in life are abandoned. The fact that a delayed reflex is weaker than an immediate one explains the demoralizing effect of the action of procrastination. Many of our prejudices may find an explanation in the phenomena of conditioned inhibition. In closing, Gantt says that much caution and perseverance, and further study are necessary before we can use the conditioned reflex with confidence in the general explanation of psychobiologic reactions—*British Medical Journal*, March 19, 1932, 1, 3715.

Food Allergy in the Differential Diagnosis of Abdominal Symptoms—Albert H. Rowe presents an analysis of the records of 100 patients with gastrointestinal complaints, which shows that food allergy not infrequently causes distention, belching, pyrosis, epigastric heaviness and sour stomach. He finds that food allergy is a frequent cause of abdominal pain and soreness. The pain may be suggestive of appendiceal inflammation, of gall-bladder disease, or of peptic ulcer. The frequency of canker sores in food allergy suggests that similar lesions could readily occur

in the stomach or duodenum, and that the continued action of digestive ferments on such sores could produce peptic ulcer. Food allergy may cause pain in the upper left abdomen, due to colonic reactions, or in the lower abdomen, localized in the descending colon, the sigmoid or the small bowel. The spasm and mucus of mucous colitis can well be explained by food allergy. Angioneurotic edema may cause severe abdominal pain and signs of intestinal obstruction, as in cases previously reported by the author. Such lesions have been discovered at operation. The fact that the symptoms of food allergy frequently simulate acute or chronic abdominal lesions has led to many unnecessary operations in the past. Hence the necessity for the study of every patient with potential or active allergy in mind is paramount. Positive or negative evidence of such allergy should be included in the family and personal history of every patient. Because of the frequency of negative skin reactions in food allergy, the use of "elimination diets" for diagnosis has been found of increasing value. Many obscure symptoms have been found due to food allergy by means of these diagnostic diets.—*American Journal of the Medical Sciences*, April, 1932, clxxxiii, 4.

Tender Rib-Cartilage as a Sign of Cholecystitis.—In examining a case of cholecystitis some years ago, D. W. Carmalt-Jones says his finger-tips accidentally came into abrupt contact with the patient's rib-cartilage bounding the right hypochondrium. This produced sharp pain, and on closer examination a tender spot was found upon the eighth right costal cartilage, on its lower edge. Since then he has found this sign repeatedly in cases of cholecystitis, with or without gall-stones. The sign is sought for with the hand on the upper abdomen; the third finger-tip is brought into firm contact with the costal margin, inch by inch along its entire length from without inward, beginning on the left side, saying nothing and watching the patient's face. A single tender spot, indicated by the patient's expression, is found generally on the eighth rib edge, sometimes a little higher or lower, and just covered by the finger tips. Occasionally the skin of the whole eighth dorsal segment is hyperalgesic to pin-prick. The author believes this tender spot to be quite as dependable in the diagnosis of cholecystitis as is McBurney's point in appendicitis. The sign is not invariably present, and in some cases it comes and goes. No mention of this tenderness seems to have been made by writers on gall-bladder disease. After discussing the possible mechanism of the production of the tenderness, the author suggests that spasm of the sphincter of Oddi, which is believed to be controlled by the

sympathetic, may induce this tender spot on the body wall, and sometimes hyperalgesia of a whole segment in the area of corresponding somatic innervation. He believes that some of the cases showing this sign, and found negative at operation, may be due to intestinal allergy, a subject he plans to discuss in another paper.—*The Lancet*, March 19, 1932, ccxxii, 5664.

Orthostatic Albuminuria and Its Psychophysical Behavior.—By orthostatic albuminuria, says J. Schreiber, writing in the *Deutsche medizinische Wochenschrift* of February 19, 1932, is meant an excretion of albumin in the urine after the patient has been standing quietly. It has been generally held that this albuminuria is due to circulatory disturbances in the kidneys, which are in their turn attributable to cardiovascular, hemodynamic, vasomotor, neurostatic, or other mechanical influences. Thus Jehle attributes it to a thoraco-lumbar lordosis, which mechanically causes a change in the position of the diaphragm, which in its turn produces a kinking of the veins of the kidneys or of the vena cava. If this lordosis is the cause, it is evidently due to the fact that his test persons were examined not in orthostasis but in "hyperorthostasis," that is, in strict military position, which is a forced and unnatural posture. In such attitudes lordoses are commonly formed. If we compare the albuminuria of hyperorthostasis with that which occurs during simple orthostasis, we find the former runs a much briefer course, which rests on the fact that the boys can bear the extreme military position only 10 to 12 minutes, and the experiment has to be broken off then. In the absence of any other satisfactory cause for orthostatic albuminuria Schreiber addressed himself to the nervous or psychic side of the question. He attempted to influence the boys psychically, and then to watch the effect. This was a difficult thing to do, despite the long standing experience that fear and pleasure influence the circulation—its tension and relaxation, the pulse count, and blood pressure. He tried the hypnotic suggestion of a juggler's performance, without any success. Then he gave them a graphophone concert, with lively dances, marches, operatic songs—the so-called "hits." This was successful. In every curve the albuminuria disappeared during the playing, if it had been present before; or it failed to appear when the music ceased. This particular music plainly had the effect of emphasizing pleasure or delight, while the juggler's tricks had produced rather the stimuli to tension or relaxation. Schreiber suggests that it is wise to bear these mental processes in mind, alike on diagnostic as on therapeutic grounds.

LEGAL

PRIVATE HOSPITALS—LEGAL LIABILITY FOR ACTS OF NURSE

By LORENZ J. BROSNAN, Esq.

Counsel, Medical Society of the State of New York

The legal liability of a charitable, not-for-profit institution for acts of its employees has been the subject of a long series of decisions in this and other States. Many of these decisions we have reviewed in these columns. Succinctly stated, it may be said that a charitable, not-for-profit institution is not responsible for the acts of its physicians, nurses or internes, provided due care has been exercised by the hospital in the selection of such physicians, nurses or internes. We do not, however, find in the reported decisions many cases dealing with the legal liability of the so-called private hospital. An interesting case against a private hospital for the acts of one of its nurses recently arose in one of our Southern States. In order to understand the situation before the court, it is necessary to set forth the evidence at some length.

The plaintiff, while working in a mine, sustained certain injuries to his right hip and leg and was taken to a private hospital for treatment. He there obtained a private room. As the plaintiff on the trial of the case testified, what transpired was substantially as follows:

"They wanted to know what doctor I wanted, and I told them Dr. R. told me to call for Dr. C. . . . He afterwards came. I was suffering bad and don't remember exactly, but he came in an hour and a half or two hours. . . . There was a lady that came up the first afternoon that I took to be the clerk, but don't know who she was, except I know she was not a nurse, and she said, 'If you've got any valuables, I will take them to the office.' So I had some money and my watch and gave them to her and she took them out of the room. . . . Dr. C. came in the afternoon and examined me and says: 'We will have to have an x-ray made of that right hip and see what kind of an injury you have. I do not believe you have got anything but a bad sprain and a bad bruise,' . . . A day nurse and a night nurse attended on me—one during the day and one during the night. I was discharged from the hospital on Thursday afternoon. Dr. C. had told me that I had a bad sprain and bruise and said, 'If you want to go home, I do not see why you can't do as well at home as you can here,' and I said, 'I am a poor man and unable to pay hospital expenses if I can get out of paying them.' So, on Thursday morning I asked the nurse and said: 'Did the doctor say anything about me getting off?' She said, 'He hasn't said anything to me about you

leaving, but if the doctor says you haven't got anything but a bruise I don't see why you can't go.' I said, 'I would like to go home if I don't have to stay, would like to be at home if I can do as well at home.' There wasn't anything more said about it until that afternoon when she came around about one or two o'clock and I said, 'Have you seen the doctor yet?' And she said, 'No, sir.' And I said, 'I think some of my people will be here this afternoon and I would like to go home.' And she said, 'I haven't seen the doctor yet—Don't know whether he is going to be over here in the hospital or whether he is out of town. Don't know where he is.' That afternoon my wife and some neighbors came to see me. I said to the nurse that came in with them, 'Nurse, I want to go home this afternoon, but I am not going to leave here without the doctor's, without a discharge from the doctor,' and she said, 'I will go and see the doctor or will call him and see if you can get a discharge.' She went out again and I judge this was about four or five o'clock. When she came back there was another lady with her. This lady had my pocketbook and watch and my bill and she said, 'Here is your money.' I took the money, and said, 'How much is my bill?' She handed me the bill and I paid it. The lady that brought my pocketbook and money was the same lady that took my pocketbook and money. The nurse said if the doctor ordered me discharged she would have my bill sent up. . . . I left the hospital that evening. After I paid my bill I left as quick as the boys could put me on a stretcher and carry me down and put me in the car. . . . On the way home every time we would turn a curve either way it was just like a knife running through my hip. When my leg would creak a little I would feel something like a grinding, like two somethings rubbing together."

The plaintiff was driven home a distance of about forty-five miles over rough roads and the ride was extremely painful to him. Upon arriving at his destination he consulted another doctor and it was ascertained that he was suffering from a fracture of the leg. The patient was directed to immediately enter another hospital for treatment. He finally obtained a bad end result with about two inches shortening of the leg and considerable limitation of motion.

He instituted a suit against the private hospital, charging that the suffering which he went through and the bad result obtained by him was

directly attributable to the negligence of the nurse in discharging him from the hospital without the actual consent of the doctor in charge of the case. It was clear from the testimony at the trial that the nurse who had discharged the patient was a student nurse who had been in training for somewhat more than two years and that she had not communicated with the physician in charge of the patient's case or obtained his consent before discharging the patient from the hospital. A verdict was rendered by the jury in favor of the plaintiff.

An appeal was taken and the highest court of the State ruled that the judgment obtained in the lower court should be reversed. While the court stated the law to be that a private hospital operated for profit is held to the duty of ordinary care in the treatment and protection of patients and is responsible for injuries resulting from failure to perform such duty, the court ruled that under the facts of this case a cause of action had not been proved against the hospital. The court said in its opinion:

"In the case at bar the plaintiff selected his own physician. Therefore, the hospital assumed no liability and was charged with no responsibility for the medical treatment of the plaintiff for the time when the relationship of patient and physician should be terminated by discharge of the patient. Nor was the hospital, under the circumstances, charged with any duty in procuring a termination of the relationship of patient and physician. Hence, if no such duty was imposed upon the defendant and if it did not assume the performance of such duty then there is no negligence upon its part, and, consequently, no liability.

"The record discloses that the patient requested the nurse to secure for him certain information from his physician. Assuming that the nurse negligently failed to do so, it is apparent that she was acting upon the request of the plaintiff in a matter with which the defendant hospital was not concerned."

The Appellate Court in its decision ruled that if it appeared from the credible evidence that the nurse "was assigned to the plaintiff's case for the purpose of carrying out the orders and instructions of Dr. C. in the treatment and care of the plaintiff, and that she undertook, at the instance of the plaintiff, or at the suggestion of the plaintiff, or upon her own motion in behalf of the plaintiff to procure the consent of Dr. C. to the plaintiff's returning home," the said nurse,

"was the agent of the plaintiff and not the agent of defendant hospital and that her act in so doing was not the act of the hospital and the hospital is not bound by her said act and the defendant hospital would not be liable for her act."

The court in its decision made reference to a recent case which was passed upon by the Court of Appeals of New York State in which a similar ruling was made. The said case arose out of the employment by a railroad company of a nurse who acted under the general direction of the railroad company's physician. In its opinion the Court of Appeals said:

"But a trained nurse called in on a special case is not in the service or the servant of the employer. She is a professional person like a physician, employed to exercise her calling to the best of her ability according to her own discretion, subject only to the general directions of the physician in charge of the case.

"The circumstance that nurses are subject to the general supervision of the physician in charge of the case and do not, like such physicians, act entirely on their own responsibility, has not led the court to distinguish between physicians and nurses in this regard. They are regarded as especially equipped to render professional services to patients when called on to do so rather than as workmen. They are grouped with doctors and lawyers rather than cooks and chambermaids.

"The rule of relationship between employer and nurse is not limited in its application to charitable corporations, although it has often been applied to relieve such corporations from liability for the negligent acts of physicians and nurses employed by them in the treatment of patients. It rests on the fact that one who employs such a nurse to take care of an injured person undertakes, not to treat the employee through the agency of the nurse, but to procure a nurse for the special purpose for which her services are required. This is all that the railroad company did in this case. It procured the nurse, but it did not act through her in caring for the patient. She was left to act on her own responsibility under the general direction of the physician in charge of the case. Although she was, in a general sense, employed by the railroad company she was not its employee. She occupied the position of an independent contractor following her own calling rather than that of one in the service of the employer. The fact that she was employed by the railroad company rather than the hospital in no wise alters her status."

LUNG ABSCESS FOLLOWING TONSILLECTOMY

A woman about thirty-five years of age consulted the defendant who specialized in ear, nose and throat work, complaining of headache and dizziness. He examined her and found a condition of hypertrophied and diseased tonsils. He advised their removal and suggested that the operation be performed under a local anaesthetic. The plaintiff refused the operation under a local anaesthetic, stating that she was afraid, and that she wanted a general anaesthetic. The doctor agreed to use the general anaesthetic, and the next day the tonsillectomy was performed at a private sanitarium. The doctor was assisted by a physician who gave the anaesthetic and an experienced nurse. The operation was uneventful with very little bleeding. The patient remained at the hospital for twenty-four hours and then returned to her home.

A week later she returned to the doctor's office for examination. He found her throat clean and discharged her. Apparently, a few days subsequent thereto the patient went for a trip by open motor car a distance of over 100 miles and contracted a heavy cold. She developed a lung abscess and entered a hospital where she remained for about a month, receiving treatment for her condition by several doctors. At her discharge therefrom she was in need of further treatment and left the hospital contrary to the advice of her physicians.

The next the defendant doctor saw of the

woman was about eight months after the tonsillectomy when she came to him for examination and he found a condition of rhinitis with a thick mucous discharge. He did not treat her but referred her to another doctor.

A few months later he received papers starting suit on behalf of the patient, claiming that contrary to proper practice and contrary to her wishes, the doctor had performed the tonsillectomy under a general rather than a local anaesthetic and as a result she had a lung abscess.

Some time after the suit had been started the plaintiff's attorney applied to the court and obtained an order permitting that the testimony be taken before trial of one of the doctors who had treated the patient for the lung abscess. The said doctor appeared in court as a witness for the plaintiff and was interrogated at length by plaintiff's counsel with respect to the cause of the lung abscess, and obtained answers in reply to his own questioning that completely vindicated the defendant doctor. The plaintiff's counsel sought to obtain from the said doctor expert testimony in advance of the trial to aid his case, but as a matter of fact the doctor so used as a witness, in answering all questions dealing with the cause of the lung abscess, and the propriety of the treatment rendered by the defendant, gave replies so favorable to the defendant doctor that a few days later the attorney for the plaintiff consented to discontinue the action.

APPLICATION OF IODINE PETROGIN TO THROAT

A middle-aged man consulted an ear, nose and throat specialist with respect to a condition which was diagnosed as acute frontal sinusitis. The doctor determined to administer as treatment an application of ephedrine to the nasal chambers and 25% argyrol to the throat. On the second treatment, in some unknown way, the doctor's vial of iodine petrogin had been changed in location on his treatment table so that it was placed where his vial of argyrol was usually kept. As a result when the doctor made the application to the patient's throat on the occasion of the said visit he applied a 5% solution of iodine petrogin to the patient's throat instead of the intended argyrol. The patient suffered an immediate muscle spasm, which caused the patient to become greatly agitated. The doctor at once sprayed pure liquid vasoline into the patient's nose followed by a starch solution by mouth. He was then allowed to rest on a couch and was taken to his home by the doctor. The doctor

called at the patient's home thereafter and continued to care for the patient. No real harm appeared to result from the error, and in a week's time the sinus condition as well as the reaction to the iodine was completely cleared up.

Suit was brought by the patient charging that the application of ten per cent iodine petrogin was negligent and caused injuries to his pharynx, larynx and nose. It was further claimed that he had suffered for an extended period of time complete nervous exhaustion, blurring of eyesight, dizziness, pains throughout the body, and a nervous shock causing fear of high elevations, and loss of control of the tear ducts, as well as other miscellaneous injuries. He also claimed that as a result of the application of the iodine he had been prevented from attending to his vocation for three months.

The case came on for trial before a judge and jury and after the issues had been submitted to the jury, the verdict was no cause of action.

NEWS NOTES

THE ANNUAL MEETING

The one hundred and twenty-sixth annual meeting of the Medical Society of the State of New York was held on May 23, 24 and 25, 1932, in the Hotel Statler, Buffalo, N. Y. This meeting was one of the most successful in the history of the Society; in fact it was the most successful in many respects, as it naturally would be, in view of the great progress in the activities of the Society.

Attendance: The total attendance cannot be determined until the registration at the several divisions of the Society is compiled and duplications eliminated; but an unusual number of physicians were present. One noticed the great number of new faces among the groups of older men who are known as regular attendants. It is an excellent sign of progress that the younger men find satisfaction in their association with those of long experience in Society affairs.

Several of the newer attendants were heard to comment on the great amount of work which had to be done in order to prepare for the meeting and keep it running smoothly. This *Journal* of May first called attention editorially to the fact that about 275 members were directly concerned in making the preparations for the meeting. Add to this the 175 members of the House, and the number who came because of their special interest in some phase of the meeting, and it will be found that over 500 physicians took part in the preparation and execution of the program of the meeting.

An important factor in securing a large attendance was the publicity given by the *Journal* to all phases of the meeting. The *Journal* printed 75 pages of programs, reports, and descriptions in its issues of April fifteenth and May first. This is almost equal to the entire space in one issue of the *Journal*. The results have justified the efforts put forth in education and publicity, for the members came together well informed as to the questions to be considered.

House of Delegates: The deliberations of the House of Delegates were marked with promptness and efficiency. The principal business was a consideration of the reports of the officers and committees, and action on the policies which were suggested. The wise transaction of business was greatly facilitated by two features which have only recently been introduced into the House.

1. The publication of the reports a month in advance of the meeting.

2. The full consideration of the reports by the

reference committees which were appointed to study the reports and to express opinions regarding their wisdom and value. Some of the reference committees began their studies immediately after the publication of the reports, and were therefore prepared to express their opinions concisely and clearly. The result was an unusual degree of harmony in the deliberations. If a matter was controversial, it was referred back to its officer or committee for further study.

The report of the Committee on Economics had been given extensive study by the reference committee. The report was stated to be essentially a plan for future study rather than a final settlement of any problem in medical economics. The report made a favorable impression and its chairman was unanimously re-elected.

The subject of press publicity aroused a considerable degree of interest. This subject is one of the latest to be considered by the State Society, and a special committee on the subject was appointed only a few months ago. It plans to inspire the County Societies to give publicity to its efforts and policies in its own local districts. It also considered the question of similar publicity by the State Society, but time has been too short for the development of definite plans of action.

Consideration was also given to the radio publicity carried on by the special committee on periodic health examinations. The evolution of all forms of publicity will be left to future developments.

The newspapers gave the physicians the space to which they would be entitled in a proper balance of news of the day. The *New York Times* sent a special correspondent who cooperated with the Press Publicity Committee in preparing readable reports of the proceedings of the meeting.

The complete minutes of the House of Delegates will be published in the *Journal* as soon as they can be prepared. Few persons realize the amount of work that is necessary in checking up every item of the proceedings and in preparing the paragraphs and cross references for easy reading and comprehension. The minutes will probably appear in the *Journal* of June fifteenth.

Scientific Exhibits: A series of scientific exhibits was arranged in the lobby of the Ball-Room which was used as the principal assembly hall of the meeting. The Buffalo Medical School and City Hospital arranged a series of specimens in pairs, one representing the x-ray of the condition and the other the pathological specimen of the

affected organ or tissue. These specimens were in regular use in teaching medical students, but were equally instructive to practicing physicians.

A striking exhibit was that of the circulation in the kidney of a living frog. The capsule of the kidney is thin and transparent, and the outlines of the glomeruli and tubules may be readily seen on the surface by reflected light. The capillaries and smaller arteries and veins were beautiful streams of suspended blood cells coursing among the islands of tubules and glomeruli.

The State Department of Health had an exhibit of wax models of syphilitic lesions colored true to life. Over fifty conditions were shown in the collection. The method of taking serum from primary sores for diagnosis was also shown.

Clinics: The response to the clinics announced for the first day of the session was unusually great. Some clinic rooms were filled to overflowing. The members showed a special interest in the clinics and exhibits of the New York State Institute for Study of Malignant Disease of which Dr. Burton Simpson is Director. This Institute is at the service of every physician in New York State. It is desirous of receiving specimens of all tumors, and will examine and report their nature free of charge.

Scientific Meetings: The afternoon meetings were given over to general sessions for the discussion of problems of interest to all practitioners of medicine. One subject of great interest was the value of serum from recovered cases of poliomyelitis in the prevention and treatment of the disease.

Mornings were devoted to meetings of the sections. The papers read at the sections and general meetings will be published in this Journal throughout the year.

The Anniversary Meeting and Banquet: The banquet was held on the evening of May twenty-fourth. Nearly one hundred tables had been set, each for six persons, and there was scarcely a vacant seat in the Ball Room. In fact, a whole row of tables had to be set in the gallery.

The anniversary meeting which is required by the original charter of the State Society took the

place of the after-dinner addresses. President Johnson presided and clothed his remarks with the combination of fact and poetry for which he is noted. The principal speaker was Dr. George David Stewart, Professor of Surgery in the New York University and Bellevue Medical School, whose subject was "The Individual in Medicine." The reputation of Dr. Stewart as a pleasing speaker was undoubtedly a factor in securing the large attendance.

Dr. Johnson introduced the incoming President, Dr. Chas. Gordon Heyd, of New York City, who expressed the greetings of the new officers and committeemen, most of whom were already veterans in the service. An inaugural statement by Dr. Heyd appears on page 674 of this issue.

The Technical Exhibits: The limitation of floor space prevented the development of the technical exhibits to an unusual size, but the State Society showed its good will toward the exhibitors by tendering them a supper and entertainment on the evening of the first day of the session. Most of the exhibitors are also patrons of the advertising pages of the Journal, and their good will is felt throughout the entire year.

The Printed Program: An innovation that was favorably received was the program of sixty-six pages. This contained a greater amount of information than any previous program. Of special value was the outline of each scientific paper and summary of its contents.

Social: The feature which most members will recall the most frequently is that of meeting their medical friends and forming new acquaintances. Impressions of new discoveries and methods of action are derived largely from the privately expressed opinions of those who are qualified to judge. The choice of a lecture to attend will often depend on the advice of a friend or new acquaintance. A physician seeks for confidential information regarding the progress of public health in a county in which all published reports are laudatory. Not the least pleasant of the memories will be those of stories obtained in exchange for equally ancient ones which renew their youth when transported to new fields.

sibility to the public in the present financial situation, that it was recognized that every doctor in the county was treating numerous cases and would continue to treat numerous cases for which he did not expect a fee or at most a delayed or greatly reduced fee. It was not the desire of the committee to interfere with this traditional role of the physician but on the contrary to encourage it and to let the fact be known that such was the practice.

Dr. Smith also brought out the point that on the other hand there are about 15,000 recorded indigent families in Nassau County who are getting relief other than medical at the expense of the several departments of social welfare, and that it was the belief of the committee that these families, already classed as indigents, should not be made an added burden to the medical profession, but that the physician should be entitled to submit a bill for his services, and should expect to be paid by the same organizations providing the other forms of relief.

The committee asked that this basic principle be recognized and established as a policy of the Society, and that the committee be authorized to negotiate with the proper welfare officers to attempt to arrive at a mutual understanding regarding methods of procedure, fees, etc., which should be necessary to reach the solution of this problem. The request was approved.

Dr. B. W. Seaman, for the Hospital Committee, stated that it was expected that bids on bonds for the new county hospital at Meadowbrook would be opened on May 3, 1932, and that it was confidently expected that a satisfactory interest rate would be offered and that the bonds would be sold. Dr. Seaman stated that if this were accomplished, it probably would mean that construction of the hospital would start by May fifteenth.

Drs. Louis N. Goldstein, Valley Stream, and Henry McD. Painton, Baldwin, were elected to membership in the Society.

Dr. L. A. Van Kleeck, President of the Second District Branch, congratulated the members and the officers of the Society upon the meeting, and upon the interest taken by the members in the work of the committees as evidenced by their attendance. Dr. Alec N. Thomson, Treasurer of the Second District Branch, invited the members to attend an afternoon of golf, and dinner at the Lawrence Golf Club on June eighth.

The President then announced that he hoped to hold an outing for the County Society the latter part of June, and after discussion, it was voted to hold a clambake.

Upon motion of Dr. Van Kleeck, the Executive Secretary was directed to send a copy of the minutes of this meeting to the NEW YORK STATE JOURNAL OF MEDICINE for publication.

RENSSELAER COUNTY

The regular meeting of the Rensselaer County Medical Society was held May 10, 1932, at the Samaritan Hospital, Troy, N. Y. After a brief business session, the following scientific program was given by members of the hospital staff.

1. Case histories.

- (a) Carcinoma of the brain
- (b) Pernicious Anemia with Spinal Cord Lesions, Dr. Harry W. Carey.

2. A paper on "Vincent's Infection—a Medical and Dental Problem," was read by the hospital dentist, Dr. J. Lester Sherman.

3. Illustrations of affections of the thyroid, showing diminution of function, were given by Dr. William Kirk.

4. Patients were shown with

- (a) Corneitis, Interstitial Keratitis with Scleritis
- (b) Foreign bodies in the eye
- (c) Incipient cataract of both eyes by Dr. Miles McGrane.

5. A new method of ventral suspension was discussed by Dr. John Trotter.

6. A few mastoiditis cases, cholesteoma teatoma of the ear were presented by Dr. John J. Rainey. Considerable discussion followed relative to the time to operate upon the mastoid.

7. A patient with keloid of the face was presented by Dr. James Donnelly.

The members were the guests of the hospital at a supper served under the direction of the Superintendent, Miss Grace Allison.

WILLIAM B. D. VAN AUKEN, *Secretary*

WASHINGTON COUNTY

The semi-annual meeting of the Medical Society of the County of Washington was held at Greenwich, May 10, 1932, at 4 p.m., with the President, Dr. D. M. Vickers in the chair, and the following members present: Drs. Vickers, MacArthur, Pashley, Sr. and Jr., Banker, Cuthbert, Prescott, Park, LaGrange, Holmes, Bailey, Falkenburg, Leonard, Armstrong, Rogers, Joslin, and Ring.

The meeting consisted of three parts—a business session, a social supper, and a scientific session.

Reports were made by the treasurer, Dr. C. A. Prescott of Hudson Falls; the Legislative Committee by Dr. W. A. Leonard of Cambridge; the Public Relations and Medical Economics Committee by Dr. M. A. Rogers, Greenwich; the Physical Therapy Committee by Dr. S. J.

Pashley, Jr., Hudson Falls. Dr. H. L. K. Shaw of Albany spoke on legislation.

At the scientific session the subject of "Urologic Infections" was presented by Dr. T. H. Cunningham, of Albany, who discussed the diagnosis and showed slides of the x-ray findings and surgical treatment. Dr. H. L. K. Shaw of Albany discussed the early diagnosis and medical treatment.

"Milk-borne epidemics" were described by Dr. Paul B. Brooks, Deputy State Commissioner of Health.

"Pain in the Ear" was discussed by Dr. T. F. MacArthur, Greenwich.

The subject "Prognosis" was presented by Dr. S. J. Pashley, Jr., of Hudson Falls.

S. J. BANKER, *Secretary*.

SCHOHARIE COUNTY

The Schoharie County Medical Society held its semi-annual meeting in Smith's Tavern, Middleburg, N. Y., on Thursday, May 5, 1932, seventy-five per cent of the members being present.

A business session was held and nominations for officers for 1933 were made. After a social dinner, the scientific program was carried out:

"Medical Ethics," by Dr. Don Morse Griswold, formerly of Detroit, but now of Albany.

"Diagnosis and Treatment of Pneumonia," by Dr. Thomas Ordway, Dean of the Albany Medical College, who illustrated his paper with lantern slides.

H. L. ODELL, *Secretary*.

SULLIVAN COUNTY

Dr. George F. Herben, of Loomis, and Dr. J. M. Rosenthal, of Monticello, were nominated for president of the Sullivan County Medical Society at the semi-annual meeting of the Society held at the Lenape Hotel in Liberty, on May 11, 1932. The elections will be held at the Society's annual meeting in October.

Other officers nominated were Dr. Harry Golembe, Liberty, vice-president; Dr. L. C. Payne, Liberty, secretary and treasurer; Dr. V. G. Bourke, Livingston Manor, Dr. S. W. Wells, Liberty; Dr. Harry Jacobs, Hurleyville, and Dr. J. H. Moore, Loomis, Board of Censors; Dr. Harry Golembe, chairman committee on public relations; Dr. Ralph S. Breakey, Monticello, Chairman legislation committee.

Dr. Alvan L. Barach of New York City, a visiting physician at the Presbyterian Hospital

in New York and a member of the teaching staff of Columbia University Medical School, was the guest of the society at the meeting. He spoke on the therapeutic use of oxygen in cardio-respiratory diseases, a subject on which he is recognized as one of the leading American authorities. Sullivan physicians considered the talk timely, as many county residents have suffered from severe pneumonia, a disease in which the use of oxygen properly is of great importance. In conjunction with his talk, Dr. Barach gave motion picture and still slides demonstrating the value and use of oxygen.

More than 40 physicians were in attendance. A dinner was served after the meeting.

HARRY GOLEMBE, *Chairman*,
Committee on Publicity.

THE DAILY PRESS

THE DREAM VENDER

Dreams are unfulfilled aspirations. They visualize the thoughts which are in our minds during our waking hours. James J. Montague, in his column "More Truth Than Poetry" in

the New York *Herald Tribune* of May 9, assumes these facts to be true in his verses called "The Dream Vender," which doctors might teach to their small children.

"When fades the gold that rims the West
And falls the evening dew,
When every bird is in its nest
Except an owl or two,
There comes a funny little gnome
Who never makes a sound
The while he flits from home to home
To bring the dreams around.

"One never sees him as he flies
Among the shadows dim;
The very sharpest human eyes
Could not discover him.
As swiftly as a shooting star
He hurries all about
And not the strongest iron bar
Could ever shut him out.

"The dreadful dreams he's sure to save
To bring at dead of night
To little ones who misbehave,
And sometimes even fight.
But if you always try to do
Exactly as you're told
He's pretty sure to bring to you
A dream of shining gold.

"You'll never glimpse him as he flies
On swift and golden wings,
But when the stars are in the skies
You *live* the dreams he brings.
So be as kindly as you can
And when your sleep is sound
You'll have a visit from the man
Who brings the dreams around."

READING WITH APPRECIATION

How many of us know how to read? It is often said that anyone with intelligence can read; but can they read understandingly? One of the greatest difficulties with students is that they do not grasp the meaning of what they read. Many, for example, do not possess the ability of picking out the subject, the predicate, and the object of a fairly complicated sentence, and are lost when it comes to placing the leading and the subordinate clauses in their proper relations. From time immemorial sentences have been constructed according to definite grammatical principles which must be borne in mind by readers as well as writers. It takes imagination as well as broad intelligence to interpret some sentences which come to an editorial office.

The New York *Times* of April 11 has an editorial on the problem of learning to read intelligently, and says:

"A lesson in reading, applied by Lee Emerson Bassett of Stanford University to college students, but useful to any one resolved on getting the most from literature, is the leading article in *The Quarterly Journal of Speech* for April.

"The purpose is to help students to understand and to enjoy 'the best thought of the best minds in their best moments.' There is no intention to develop public speakers, to train orators or actors. Material is chosen for its intrinsic value, and when selections are used, students are required to familiarize themselves with the whole text and with the life and work of the author. The oral reading reveals in most instances the student's intellectual honesty; and if the teacher suspects pretended knowledge, he can soon discover by a question or two how well the material is really understood.

"Students of Cornell University remember with pleasure the privilege of hearing Dr. Corson's reading, and Professor Copeland at Harvard similarly instilled a love of literature. Such teachers treat it as an art to be enjoyed."

The *Times* might have included Professor Francis A. Marsh of Lafayette College, probably the most distinguished and successful professor in teaching college students how to read intelligently, and to get all the information possible from a printed page.

FEDERAL AID

State aid for county projects is matched by Federal aid to States, as is shown by the following editorial from the *New York Sun* of March 19:

"Representative Chundblom of Illinois has done a service by spreading on the pages of the Congressional Record an account of the current appropriations for Federal aid work, appropriations in almost every instance authorized by legislation of the dollar matching stripe, whereby the States must appropriate a dollar for every dollar of Federal aid. The appropriations for the present fiscal year follow:

Rural post roads....	\$159,000,000
Federal-aid highways ...	59,000,000
Forest roads and trails ...	12,500,000

Federal Board for Vocational Education	9,694,000
Agricultural extension work . . .	8,672,000
Agricultural experiment stations.	4,357,000
Agricultural colleges	2,550,000
Rural sanitation studies	2,338,000
Forest fire cooperation	1,775,000
National forest funds	1,640,000
Mineral leasing act	1,500,000
Various special funds	657,000
Epidemic diseases	400,000
State marine schools	100,000
Forest planting stock	95,000
Education of the blind	75,000
Cooperative farm forestry	74,000
Interstate quarantine service . . .	68,000
Water-power act	58,000"

WHY QUACKS FLOURISH

The *New York Sun* of May 4 comments editorially on the investigation conducted by the National Committee on the Costs of Medical Care on the reasons that quacks flourish, and summarizes them under four heads as follows:

"1. Because of inattention by some physicians to minor illnesses and to ailments of the mind

"2. Because doctors cannot cure all diseases, and those who have failed to obtain help from regular doctors feel that little is lost by trying the 'irregulars.'

"3. Because many people are still basically superstitious about disease and health

"4. Because many patients are unaware of the limitations of healing cult practitioners

The *Sun* continues

"It will be observed that emphasis is laid on inattention by medical men to trivial ailments and to minor mental disturbances. This is another way of saying that in approach to patients some physicians lack, or refuse to use, that comforting and consoling demeanor which may be defined by the phrase 'a good bedside manner.' The quack who neglects this element of treatment does not prosper. Some physicians and surgeons are incapable of simulating interest they do not feel; others deliberately seek to avoid display of that excess of concern which is supposed to mark a certain type of practitioner and which quacks so adroitly use."

THE HYGIENE OF WEALTH

Dr. James Bayard Clark, writing in the June issue of the *Review of Reviews*, under the title "A Doctor Looks at Economics," discusses the present-day illness of the body politic from the standpoint of a practicing physician. He leads up to the idea of a "Hygiene of Wealth" as the key to the present epidemic of depression. We are somewhat familiar with the newer idea of a hygiene of the mind, and understand the practice of physical hygiene and its marvellous effects in the prevention of the physical plagues which formerly devastated the world as frequently as economic ills do now.

Dr. Clark makes a physician's examination of society, and forms the diagnosis of a common delusion regarding the essential value of money

in the purchase of happiness and contentment. He closes with the following words on prognosis and treatment.

"As with the great plagues which have been banished through making their cause definitely known to society at large, and as with the disaster of war which enlightened groups are doing their utmost to bring to the realization of all peoples, so it must be with the distressing situations brought about through an over estimation of the value of money and the consequent shrinkage of other and real values. This is why the doctor advocates a hygiene of wealth as a preliminary and salutary step toward the stabilization of human health and happiness—the *raison d'être* of all honest economics."

BOOK REVIEWS

THE CONQUEST OF OLD AGE. Methods to effect rejuvenation and to increase functional activity. By PETER SCHMIDT, M.D. Translated by EDEN and CEDAR PAUL. Octavo of 307 pages, illustrated. New York, E. P. Dutton & Co., Inc., 1931. Cloth, \$5.00.

As a result of the unfulfilled promises of Steinach and Voronoff as regards rejuvenation—one naturally approaches this subject with a marked degree of skepticism. However fruitless the experiments of these workers may have been they have made certain claims which find no basis of proof. And in this book the author has further fortified himself with a timely weapon of defense with which he aims to explain away the "good" accruing from such previous experiments, namely, the principle of internal secretions.

That all of us cherish such remote possibility as rejuvenation is probably the reason for its continued interest by a small portion of our profession. After reviewing some of the brilliant discoveries in other branches of endocrinology the writer finally aims to show that vasoligature for the male and diathermy for the female should win recognition by the profession as an absolutely reliable remedy. He reminds us that while we may not have much confidence in such unconventional procedures our routine approaches to the diseases of old age have produced for us no results of which we can be proud. A number of "successful" case reports are recorded in detailed manner to defend the cause of rejuvenation.

It is unfortunate that no mention is made of corroborative testimonies by authorities whose observations in other fields have won the respect of the profession. Until such a change of attitude is adopted such procedures cannot find their place in recognized medical practice.

EMANUEL KRIMSKY.

ELECTROTHERAPY AND THE ELEMENTS OF LIGHT THERAPY. By RICHARD KOVÁCS, M.D. Octavo of 528 pages, illustrated. Philadelphia, Lea & Febiger, 1932. Cloth, \$6.50.

When one reads a treatise on any subject that corresponds exactly with his own experiences and thoughts, very little criticism can be offered. In fact, instead the reviewer experiences a sense of hyperenthusiasm and is wont to cry "Amen" after every sentence and chapter.

Since our experiences during the Great War, there have appeared many works on the above subject matter. Some have attempted to cover the subject in a purely scientific manner, dwelling mostly upon electrophysics and electro-chemistry. Others have stressed mostly the clinical side but unfortunately in an empirical manner, without basing their results upon any definite pathological or physiological basis. There have been a few books on various phases of physiotherapy as applied in a few specified diseases. These have been of great value, especially when properly supervised clinical and pathological findings accompanied the cited case reports.

This volume is the result of a very careful and excellent observer working with all the worth-while knowledge of Physiotherapy in the atmosphere of real supervised clinical medicine. The results of these must necessarily be an excellent piece of work. Although not voluminous, it is complete and covers the elementary aspects of electrophysics, also the apparatus for the production of the different electrical currents. It explains their actions on the various tissues of the body. Adequately and very simply describes the technique of application in the principal pathological conditions. Most of all, it separates the wheat from the chaff and only

gives the therapeutic procedures that in his large experiences have stood all the proper tests.

A few chapters are especially devoted to Phototherapy. This résumé of the present status of that form of therapy would have been best if the author had not mentioned this use of Ultra-Violet therapy, even in Chronic Pulmonary Tuberculosis because all the authors at present agree it is absolutely useless and sometimes even dangerous. In Surgical Tuberculosis the volume properly stresses heliotherapy or the sun rays as the best form of light therapy but he could also have added the great moral effect of artificial forms of therapy, especially when the sunshine is unobtainable. This is not written in the sense of criticism but we are sure will be corrected in future editions, which this volume certainly deserves.

A very interesting and highly instructive part of the book is devoted to applied Electrotherapy stressing the therapeutic application of the various modalities in relation to the specialties in medicine. Electrotherapy as applied in Neurology, Gynecology, Arthritis, Genito-Urinary Surgery and Diseases of Circulation. Special chapters on application of Electrotherapy in Laryngology and Dermatology were written by eminent authorities in these specialties.

The last chapter devoted to Physiotherapy in Institutional Practice is to be considered one of the most important contributions in this volume. With the present trend of grading hospitals according to their equipment, inquiries are being received daily as to essential requirements for various sized institutions. This chapter is not only complete in regard to necessary equipment but also in detailing the various types of cases met with in hospital practice where physiotherapy has proven a very valuable adjuvant in treatment.

It is the best contribution to the subject of Electrotherapy that has thus far appeared in the English language.

B. KOVEN.

PHYSICIANS' MANUAL OF BIRTH CONTROL. By ANTOINETTE F. KONIKOW, M.D. Octavo of 245 pages. New York, Buchholz Publishing Company, 1931. Cloth, \$4.00.

As clinical evidence about the vaginal occlusive pessary by one skilled in its use, this book is important. The author bases her statements on her personal experience with birth control in office practice over a long period of years in a large city. The patients were drawn from all social classes, professionals predominating, and included many sent by charitable agencies, who would usually be served in a dispensary, were this particular service available, as it is not in her state.

The author is openminded about various forms of pessaries and has evidently studied the reports of other observers with care. She herself uses the vaginal diaphragm chiefly with or without a contraceptive jelly but the cervix cap for antelexion and retroflexion, making careful distinctions as to her reasons for choices in type and size. The reviewer finds no mention of the Matrisalus or other special forms for cystocele or rectocele.

Reports are made in detail on over 1,300 patients, of which one series of 415 were studied with special reference to success and failure in the use of the pessary. Among 379 patients following instructions faithfully, the author reports 97 per cent success. It should be noted that the figures 94 to 97 per cent repeat themselves in almost all clinic statistics as applied to the

patients who are skillfully fitted and who follow instructions

The author is inclined to condemn or disregard other methods, such as the condom, and has no reports on records of use of jellies alone, nor consideration of methods of sterilization without unsexing such as harm less vasectomy. To make a brief comparison with other writers, she presents the "case for the pessary" well, whereas the Stopes book might be called the case for my pessary" while Cooper (1928) is more comprehensive, and W J Robinson (1929) lacks the tabulation of case records shown in this book.

The summaries of Russian experience are welcome, particularly the chapter of accidents from tincture of iodine injected in women who are overdue. It is hoped that a new edition will correct some of the diagrams and certain statements on physiology, but the author's clinical travel and clinical work make her testimony of very high value.

ROBERT L. DICKINSON

LIVING THE LIVER DIET By ELMER A MINER MD
12mo of 106 pages St. Louis, The C V Mosby Company, 1931 Cloth, \$1.50

This is a very nice book written by a physician who himself has Pernicious Anemia has witnessed the help less condition of the patient before the use of the special diet and has used personally the liver treatment with pleasure and the utmost satisfaction. The Minot-Murphy diet is the one adhered to in this book. The author presents the details of the diet as used by himself with success. Different ways of preparing liver are described, one which the writer calls the "Liver Appetizer Supreme," makes a palatable drink which can be taken as a medicine and not necessarily as a part of a meal. The other foods included in the diet are also described.

With regard to the effects of sunlight, the author states that most relapses in anemia occur in the summer time when the sun's rays are most direct and he thinks that those prone to pernicious anemia should exercise caution relative to sun baths and that a liberal amount of indirect sunlight seems best.

This is a book very useful to both physician and patient and will save much time and trouble for both.

W E McCOLLUM

A DOCTOR OF THE 1870'S AND '80'S By WILLIAM ALLEN PUSEY
Octavo of 153 pages illustrated Springfield, Charles C Thomas, 1932 Cloth, \$3.00

That there may be romance in the practice of medicine is often overlooked in our preoccupations with routine affairs. That it does exist is usually realized only in moments of reflection. However colorful our lives may be it cannot seem to equal that of the country doctor. We hold a peculiar warmth of affection for the country doctor even though most of us congregate in the crowded cities.

Doctor Pusey has written a biography of his father—a not an affectionate appraisal of a great father, but of a true country doctor, of a man who lived close to nature and who knew his patients as humans, of a man who struggled with the elements in pioneering fashion and thereby learned to appreciate happiness in greater depth than we could. We read about horses and buggies and other experiences which are more alluring in fancy than in actual fact. Above all, we are made to feel that the country doctor is a myth who has gone down in the pages of medical annals.

However industrial our age may be, there surely must still be some "country doctors" in our midst. They may be obscure, but when they have passed away as this interesting old doctor, they will lend further color to the biographical pages of medical history.

EMANUEL KRINSKY

A NON-SURGICAL CONSIDERATION OF PROSTATIC ENLARGEMENT Including a lecture on The Myth of the Bladder Neck Bar. By EDWIN W HIRSCH, MD.
Octavo of 79 pages, illustrated St. Paul, Minn., Bruce Publishing Company, 1931 Boards, \$2.00

This booklet of 80 pages is a plea for more conservatism in the treatment of prostatic obstruction. The author believes that many enlarged prostates should be treated by massages, instillations, and dilatations, and that such treatment is usually efficient. He allows surgery if the prostate is of unusually large size but he does not believe that a punch operation is ever indicated.

The author's comments are very stimulating and well worth reading, his inclination to overstatement and the use of a polemic rhetoric are detracting.

H L WEHRBEIN

CONQUERING ARTHRITIS By H M MARGOLIS, M D
Octavo of 192 pages, illustrated New York, The Macmillan Company, 1931 Cloth, \$2.00

This book may be understood by any intelligent patient and gives a satisfactory account of the various types of arthritis. The author divides these into senescent, static, metabolic and infectious. Some of the chapters treat of the history of the disease, sources of infection, structure of the bones and joints, pathology and the various remedial measures. A very good general idea of treatment is given describing the effects of rest and exercise and indications for each, diet, drugs, removal of infectious foci, physiotherapy, vaccines and orthopedic measures.

The title might cause to arise, some false hopes in the mind of the patient, for the disease is certainly far from conquered by any measures described, but the author aims to instill optimism which is to be desired.

W E McCOLLUM

A TEXT BOOK OF MEDICINE FOR NURSES By E NOBLE CHAMBERLAIN MD, MSc
Octavo of 439 pages, illustrated New York, Oxford University Press, 1931 Cloth \$5.00 (Oxford Medical Publications)

In addition to medicine proper, the subjects of bacteriology and materia medica receive attention in this book which is written especially for nurses, in a somewhat simpler manner than that of the text-books for medical students. It is however, quite a comprehensive volume and suitable for the type of training school which aims at extensive theoretical as well as practical instruction for nurses. It is very well illustrated with 38 figures from various sources and 8 colored plates which are very well done.

As a text book it contains more information than many physicians would consider necessary for nurses but as a reference book it is excellent and of high grade throughout.

W E McCOLLUM

A RADIOLOGICAL STUDY OF THE PARA-NASAL SINUSES AND MASTOIDS By AMEDÉE GRANGER, KCB, MD
Octavo of 186 pages, illustrated Philadelphia, Lea & Febiger, 1932 Cloth, \$5.50

In this volume the author has compiled his numerous manuscripts pertaining to these subjects. The work is devoted almost exclusively to a discussion of his special technique for radiographic study of the sphenoid and mastoid cells. The Granger method of demonstrating the sphenoid and posterior ethmoid cells has proven the most satisfactory so far devised, while his mastoid position serves as the most practical means of demonstrating the petrous in conjunction with the mastoid portion of the temporal bone; it is well, therefore, that a complete description of these procedures has been made available for Roentgenologist and Otorhinologist.

RICHARD A RFNDICH

OUR NEIGHBORS

SURVEY OF MEDICAL AGENCIES IN MICHIGAN

An account of the progress of the survey of medical agencies and services in Michigan, authorized by the 1931 House of Delegates, was printed in this Journal of May fifteenth, page 638. The May issue of the *Journal of the Michigan State Medical Society* gives an outline of the plan of study which has been adopted by the committee. Its operation will be supervised by Mr. Nathan Sinai of Ann Arbor, Michigan, who has conducted extensive surveys of public health service in this country and in Europe.

The outline of the plan of study is printed in fine type and fills two pages of the journal. It is divided into two sections, the first six of which deal with the organization of special committees on the study by county societies, and the preparation of the forms and schedules to be filled out by county societies, individual doctors, and health agencies, and welfare organizations. Section seven outlines the classes of subjects to be investigated, and is as follows:

Collection of Data

A. Preliminary survey (Specimen 2) to be completed by local county society committees

B. Detailed individual schedules

1. Physicians' schedules

a. Mailing of preliminary letter (Specimen 10) signed by local committee in each county to all physicians in private practice. (Enclose Specimen 1)

b. Mailing of survey schedule, letter and return postal card

c. Follow-up by local committee

1. Telephone or personal contact

2. Hospital schedules (Specimen 4 or abbreviated schedule)

a. Mailing of schedules to local committees

3. Laboratory schedules (Specimen 5)

a. Mailing of preliminary letter (Specimen 13) signed by local committee

b. Mailing of schedule and return postal card

c. Follow-up by local committee

1. Telephone or personal

C. Special Studies

1. Economic structure of population

a. Distribution by counties

1. Urban

2. Rural

b. Economic data

1. Distribution of wealth

2. Incomes

3. Costs of living

4. Other county data

2. Health agencies

a. Data from study for Governor's commission (Specimen 6)

3. Industrial Service

a. Detailed schedule distributed through Manufacturers' Assn.

b. Schedule to other organizations such as fraternal, etc.

4. Welfare service

a. Data from study for Governor's commission

1. Afflicted adults

2. Afflicted children

3. Crippled children

4. Mothers' pensions

5. Tuberculosis

a. Hospital service

1. Detailed schedule (Specimen 8 to be prepared) to hospitals

b. Clinical service

1. Data from public health survey

c. Field service

1. Data from public health survey

6. Mental diseases

a. Hospital service

1. Detailed schedules to public and private hospitals

b. Clinical service

1. Special local studies

7. Miscellaneous

a. Workmen's Compensation

1. Analysis of laws

2. Relation of physician to carriers

3. Defects and merits

b. Contract practice

1. Data from physicians' schedules

2. Data from industrial study

c. Experiments

1. Medical society care of indigents

2. Group practice

3. Diagnostic clinics

4. Immunization by private practitioners

5. Collection and loan services

6. Other

d. Medical society activities

1. Data from local committees concerning scientific programs and public relations activities

e. Patients discharged from hospitals

1. Costs

2. How costs were met

Section eight deals with the analysis of the data, presumably to be made by Mr. Sinai after a plan which is outlined as follows:

Analyses and Correlation of Data, by Counties in Michigan

A. Physicians

1. Distribution

a. Urban

1. Ratio to population

2. Per capita wealth

b. Rural

1. Ratio to population

a. Population per square mile

2. According to land valuation

a. Per cent of land in farms

3. Per capita wealth

2. Ages and years in practice

a. Urban

b. Rural

1. Correlate with above rural data

3. Professional training

a. Urban

b. Rural

4. Post-graduate training

5. Specialization

a. Urban

1. Types

2. Degree

3. Preparation

b. Rural

1. As above

6. Types of cases excluded from practice by general practitioner and partial specialist

a. Urban and rural

7. Equipment (to be determined by committees)

a. Urban and rural

8. The physician's "normal" week

a. Office practice

1. Night office hours

b. Home calls

1. Night calls

c. Hospital calls

9. Number of patients

a. Urban and rural

10. Dispensing of drugs

a. Urban and rural

11. Practice of preventive medicine

a. Urban and rural

12. Fees

a. Urban and rural

13. Financial adjustments for patients

a. Method

IN ONE FORMULA--

The Combined Effects of Two Valuable Anti-Rheumatic Agents

The clinical success of Farastan (Mono-Iodo-Cinchophen Compound) in the treatment of arthritic, rheumatoid and neuritic conditions is due to the synergetic effect of nascent iodine in combination with cinchophen (U. S. Patent 1,828,525).

The published evidence serves to show that in a high percentage of cases Farastan affords definite relief from pain, increases motion and reduces swelling with an unusual freedom from undesirable side reactions.

Modern diets often lack minerals

To-day, authorities are stressing the importance of the essential mineral salts. In addition to building sturdy bones, and blood rich in hemoglobin, these mineral elements aid metabolism and contribute to nervous stability.

Yet many modern diets cannot be depended upon to furnish the proper quota of minerals, and therefore millions of people suffer from the effects of demineralization. Cooking destroys a variable amount of the mineral value of foods—in some instances as high as 76 per cent.

To correct this loss and to remedy demineralization—with its attendant symptoms of nerve fag, neurasthenia, lowered vitality and loss of energy—a tonic rich in mineral salts is needed.

Fellows' Syrup contains the mineral salts of sodium, calcium, potassium, manganese, iron and phosphorus, together with the added metabolic stimulants—strychnine and quinine. Sixty years of clinical experience the world over testify to its value as a tonic.

Suggested dosage: A teaspoonful in half a glassful of water three or four times daily.

COMMITTEE ON PUBLICATION.

ANNUAL REPORT IN OHIO

The May issue of the *Ohio State Medical Journal* contains the annual reports of the officers and committees of the Ohio State Medical Association scheduled to meet on May third. Ten reports are printed, covering thirty-six pages.

Committee on Public Policy: The first report is that of the Committee on Public Policy:

"The Committee on Public Policy has been called upon to consider an ever-increasing number of perplexing questions, ranging from those of government functions and legislation, to acute problems of ethics and professional conduct."

"In times of unrest, radicals, theorists, reformers, uplifters flourish. They propagandize for a new social and political structure. Artificial panaceas are advocated to correct social and economic imbalances, which would add new governmental functions, create greater centralization, more bureaus and departments, and new services to supersede local responsibility, individual initiative and enterprise."

"The antiquated theory that medical organization need not greatly concern itself about governmental and legislative questions, unless they pertain directly to public health, scientific medicine and medical practice, must be discarded. Present-day developments clearly show that practically all questions—social, economic and political in nature—have some effect, large or small, on public health; tend to modify to some extent medical practice; and effect in many ways the social and economic status of the individual physician. It is the duty and responsibility of every member of medical organization to keep himself accurately informed on the trends in government and legislation, and to take an active, personal interest in moulding public opinion in accordance with the fundamentally sound, concerted medical viewpoint on matters affecting public health, medical practice, scientific medicine, and the social-economic status of physicians."

The Committee devoted a page to an argument against the plan of indiscriminate relief of ex-soldiers of the World War. It devoted a column to the care of the indigent, and concluded:

"This committee feels that the question is largely one of local administration and local determination. A satisfactory solution should be worked out jointly by a committee from each county medical society or academy of medicine and the local public officials. A mutual and proper understanding of the responsibilities of public officials, as well as the medical profession, to the indigent sick should be attained, as well as an understanding of the proper spirit of cooperation that should exist between these two groups. Numerous instances could be cited where proper understanding and cooperation have been developed by effective and concerted effort on the part

(Continued on page 699—Adv. xvii)

(Continued from page 698—Adv xvi)

of the county medical society, and where public officials have been convinced of the desirability of providing the dependents of the county with the proper type of medical service for which fair compensation is paid."

A discussion of medical ethics covered a page The committee reported

"New angles in the question of professional relations are constantly arising because of the rapid increase in the number of persons engaged in health and medical activities in the number of individuals belonging to professions accessory to medicine itself, and in the number of non-descript healers, practicing some limited branch of medicine or exploiting some ism or cult."

"The sentiment of the various members of the Council, in which your committee concurs, was that it is unprofessional for any physician to call into consultation unqualified practitioners, and that it also is unprofessional for physicians to consult with practitioners inadequately trained in the medical sciences 'who are unfit or unqualified because deficient either in moral character or education'."

The committee also briefly discussed the following topics

State Department of Health

State Pharmaceutical Association

State Nurses' Association

State Bureau of Motor Vehicle (The examination of auto drivers)

State Child Welfare Conference

Establishing a State Criminologic Institute

Inspection of Osteopathic Schools

Committee on Medical Economics The committee on economics reported

"The practice of medicine is confronted with the two-fold responsibility of adjusting itself, first, to its own changing technics, and second, to the changing organization of society"

"The difficulties which frequently follow any modification of the relationship between the medical profession and the public are reflected in problems which have arisen as a result of the expansion of governmental functions in the field of medicine and health, the exploitation of socialized health and medical undertakings, and the increase in the number of unnecessary specialized movements"

The committee then entered into a lengthy discussion of a physician's liability for disclosing information secured under the Workmen's Compensation law. It also discussed the general operation of the law, and the racket of irresponsible agencies for collections and insurance

Publication The report of the committee on Publication filled two pages, and was an excellent exposition of the policy of the Journal. Two paragraphs are of special interest

"Several papers submitted by Ohio physicians who were not members of the State Association

Almost as Simple as Breast Milk

No complicating feeding calculators are necessary in feeding S.M.A., the anti-rachitic breast milk adaptation

As with breast milk, the total quantity of S.M.A. is merely increased as the infant's requirements increase with age

For the convenience of the busy physician we have prepared the simple suggested feeding table shown above. On the other side are brief directions for the preparation of S.M.A. and suggestions on the amounts to be fed

Free: Send the coupon for your copy of this single thickness celluloid card, 2½" x 4½", with rounded corners to go into the pocket readily

What Is S.M.A.?

S.M.A. is a food for infants—derived from tuberculin tested cows' milk the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil. With the addition of milk sugar, potassium chloride and salts, altogether forming an antirachitic food. When diluted according to directions it is essentially similar to human milk in percentages of protein, fat, carbohydrates and ash in chemical constants of the fat and in physical properties.

were rejected, the committee feeling that since non-members are not permitted to enjoy the privileges of the State Association, it would be inconsistent for the committee to permit non-members to use the columns of The Journal for scientific presentations."

"Each month The Journal has carried numerous news notes and personals concerning Ohio physicians. It has endeavored to keep the members informed about the activities of the hospitals of the state."

Medical Defense: The Journal devotes three pages to the report of the Committee on Medical Defense, and discusses the problem from many angles. It gives the following summary of suits against doctors:

"Year"	"Suits"	"Threats"
"1916-1920, inclusive	53	43
"1921	18	9
"1922	15	15
"1923	10	10
"1924	14	7
"1925	13	10
"1926	18	16
"1927	10	9
"1928	21	7
"1929	23	16
"1930	16	17
"1931	19	20
"1932 (Jan. to March)	4	4
	234"	173"

Medical Education and Hospitals: The five-page report of the Committee on Medical Education and Hospitals is largely an essay discussing the general phases of the following topics:

Social Problems.

Post graduate Ability.

Interne Training.

Approved Hospitals and their A.M.A. Rating

Periodic Health Examinations: The three-page report of the Committee on Periodic Health Examinations first discussed three popular misconceptions regarding the examinations:

1. That it guarantees increased longevity.

2. That an impersonal examination is more valuable than that by a family physician.

3. An excessive value of the examinations conducted by incorporated groups, concerning which the report says:

"The methods employed by these concerns, employing certain physicians on a salary basis to make the examination and submit their reports to a 'central office' for interpretation and a re-check, has tended to undermine the confidence of a portion of the public in the ability of the local medical profession. Such tactics have disturbed the relationship between the public and

(Continued from page 700—Adv. xviii)

local practitioners, and anything that disturbs this relationship is detrimental to the best interest of the public."

The committee gave the following practical advice:

"Any program of activity which a county medical society or academy of medicine should decide to undertake may include cooperation between the society and various local civic, welfare and health groups and organizations in the promotion of the periodic health examination movement. The advice and counsel of the profession should be given to such groups to guide them in their activities. Individual physicians when invited to do so, may with propriety, appear before civic groups, clubs, societies and public gatherings to discuss the question of health examinations and other subjects having to do with preventive and curative medicine. A number of county medical societies and academies have formed contacts of this character and have been of much assistance in promoting health programs among the laity."

Financial: The report of the finances of the State Association was given by the Committee on Auditing and Appropriations.

Mental Hygiene: The report of the Committee on Mental Hygiene consists largely of arguments for increasing the capacity of the State Hospitals for mental cases.

Military Service: The Committee on Military Affairs discussed the problem in a general way, but without disclosing any direct connection of the State Medical Association with military organizations.

Councilors: The Secretary of the Council gave the report of the councilors of the ten District Branches. The Council holds meetings about once every two months.

References: An excellent feature of the annual reports was the numerous references to articles and reports published in the Journal throughout the year. The *Ohio Journal* fulfils its object of being in reality the organ of the State Society.

ANNUAL MEETING IN OHIO

The April issue of the *Ohio State Medical Journal* contains the advance notices of the Annual Meeting to be held in Dayton on Tuesday and Wednesday, May 3 and 4.

The House of Delegates will meet on Tuesday morning and late on Wednesday afternoon.

(Continued on page 702—Adv. xx)

(Continued from page 703—Adv. xxi)

Department was so inadequate it could not function except for liberal federal assistance.

"We have many problems yet to be dealt with in the next legislature, such as the care of insane patients in state institutions.

"We maintain bank examiners, hotel inspectors, weight and scale checkers, inspectors for livestock, and many others. How much more necessary it is to maintain a Medical Board to supervise the care of thousands of patients now confined in state institutions.

"Our Association is rapidly building itself into the life of the state. We are enjoying far more prestige, confidence, and good-will than we ever have before. Cooperation such as we are now getting from individual members will in the future carry our influence to undreamed of heights."

CRIPPLED CHILDREN IN KANSAS

An unusual phase of the problem of the care of crippled children is shown in the following presidential message from Dr. P. S. Mitchell, President of the Kansas Medical Society, printed in the March number of the Journal of the Society:

"My attention has been called to an article published in the *Topeka State Journal* under date of February 24, 1932, in reference to scandals emanating from recent legislation on aid for crippled children.

"As president and active chairman of the Council at the Mid-winter Council Meeting, I wish to state I sat through the entire meeting and heard every word, discussion and motion. Not even an intimation or a suggestion was made by any member or any one present in reference to the charge made, or any plan whereby the Kansas Medical Society should even consider any such responsibility. No mention was made of any plan for the development of such a hospital.

"Personally, it is my opinion that high-class surgeons all over the state should be selected, first as being men capable of doing this work in their home hospitals if adaptable and permit each worthy individual to be treated if practical in his home community.

"We should recognize in this day that no one has a corner on worthy surgery. It is true that some surgery is more approved than that of others, but such may be arranged in the first selection."

*Definite dosage
Ease of administration
Sensible economy*

Each pill contains 0.1 gram (1½ grains) of physiologically tested digitalis leaves. The finished pills, too, are biologically assayed, thus giving re-assurance of their activity.

Each pill represents 15 minims of the U.S.P. tincture and permits of more accurate dosage than do liquids, as drops may vary in size.

These pills contain digitalis in its completeness and not any separated or extracted part of it, therefore present the entire therapy of this valuable drug.

Physician's trial size package and literature sent free upon request.

LIBELOUS LETTERS IN MICHIGAN

New York physicians may learn a practical point in libel by reading the following medico-legal note in the April number of the *Journal of the Michigan State Medical Society*:

"In typewritten letters this identification mark 'JD/JS' is assumed to mean that the letter was dictated by John Doe to Josie Stuat, the stenographer. Firms, institutions, employing several or more stenographers, adopted this identification means. When typewriters were made attainable by the rank and file many of us purchased one and felt we were in an advanced class of business progressives. We used the typewriter and our own 'hunt and pick' system to write our letters—some still do. And then a new custom became in vogue—to employ a stenographer, if you could afford it, and you dictated your letters, they were typed and all you did was sign the letter. The 'JD/JS' in the lower left corner conveyed to the recipient that you had graduated from the 'hunt and pick' system and were up with big business in employing a stenographer.

"We advise that you stop it. If you have a stenographer forbid this identification. Do not use it yourself. Why?

"In a recent suit for libel and slander, the plaintiff presented letters sent by the defendant that were identified in the lower left corner by a 'JD/JS.' The claim was made, and upheld by the court, that the identification mark was proof positive that the libel and slander statements had been made to a third party, the stenographer, and this won the case and a monetary verdict. Had the JD/JS been omitted from the letter there would have been no evidence of a third party and no verdict.

"So forget style or pride. Ban the identification mark. Safeguard yourself in these

days when we are prone to write 'harsh words' to the party who doesn't pay his bill. In these depression days it is not a mark of 'common class' not to have a stenographer, and slander or libel suits cost money."

STUDENT LECTURES ON ECONOMICS IN OKLAHOMA

The annual report of the Committee on Medical Economics of the Oklahoma State Medical Association, printed in the May Journal of the Association begins with a discussion of lectures to medical students under the auspices of the State Association.

The report says:

"Members of the Committee on Medical Economics knew that a course on Practical Economics was being given to the dentists of the State by the Extension Division Department of Post-Graduate Medical and Dental Study of the University of Oklahoma. Your Chairman discussed with Mr. L. W. Kibler, Director of Post-Graduate Study, the feasibility of offering this course to the medical profession.

"Following this discussion, the first thing necessary was to know if such a course could be applied to the medical profession. To determine this, the Extension Department conducted a survey. Their field workers went into several of the doctors' offices in various points throughout the state. Results of this survey and reports from the doctors whose offices were visited, thoroughly indicate that not only is a course applicable, but highly desirable. The Councilors of the state have been informed of this survey and the results, and this matter will be presented to them at their next meeting. From the knowledge your Chairman has of this work, it is hoped that one of the several plans suggested will be adopted by the Councilors, so that the members of the Oklahoma State Medical Association may have the benefit of this course."

A CASE OF POLYCYTHEMIA TREATED WITH PHENYLHYDRAZINE *

By THEODORE S. EVANS, M.D., NEW HAVEN, CONN.

IN reviewing the literature regarding polycythemia, a great many references were found. General reviews of the subject were published by Weber^{25,26,27,28} and Gaesböck,^{28,29} et al. The most painstaking and complete summary of the subject was written by Harrop,³⁰ and in this discussion, all of the aspects of the disease are brought out, but some are not clearly defined. There are certain unusual points in this case which were not stressed by him.

The literature for the past five years is replete with reference to the use of phenylhydrazine in the treatment of polycythemia. However the small dose which had such disastrous effects in this case, the extreme difference in the effect between the freshly prepared drug and that prepared long before being used, the very low point which the hemoglobin and the red blood count reached, and the apparent idiosyncrasy of the patient to this drug are all points of unusual interest. Then, too, the patient has been carefully followed over a long period of time, and the idiosyncrasy of the drug has been apparent in the course of the disease by reason of the very small maintenance dose.

Barker⁹ gives an interesting discussion of the physiological states in which polycythemia is seen, and discusses particularly polycythemia as seen in pulmonary disease. The presence of high red blood count and hemoglobin at the extremes of life is well known to every practitioner and has been ably discussed by Lippman,⁴⁵ Hirschfeld,^{33,34} Hammer³² and Schlesinger and Naegeli.⁴⁶

Further interesting studies of the condition which is present immediately after meals, during exercise, during the menstrual period, and so forth, were made by Hirschfeld^{33,34} and Naegeli.⁴⁶ Barcroft^{7,8} and Lamson,^{40,41,42,43} et al, called attention to the importance of the spleen as a storehouse for red blood cells and to its coincidental enlargement in cases of polycythemia vera. The effect of altitude on the red blood cells has been discussed by Bert¹² and Viault⁶⁹ as early as 1882 and 1890 respectively.

Börnstein¹⁰ produced an anemia by increasing the oxygen tension and a polycythemia by decreasing the oxygen tension. His work was corroborated by Campbell,^{17,18} Drinker, et al.,^{23,24} and Sabin⁵⁰ have studied the blood flow through bone marrow in cases of polycythemia vera.

The use of phenylhydrazine in reducing the red blood cells and hemoglobin was first studied by Hoppe and Seyler³⁵ in 1885 in animal experimentation. They found it very prompt, effective and quite safe. However, its clinical application was not made until 1918 when Eppinger and Kloss²² used it in man in polycythemia vera. Since then, their sterling work has been corroborated by workers all over the world, particularly during the last five or six years. Hurwitz and Falconer³⁸ discussed the use of benzol and its derivatives and compared its value with that of α -ray of the long bones, but they were inclined to think that α -ray was a far better treatment.

Hurwitz and Levithin³⁹ brought out relatively the same subject matter and arrived at the same conclusions.

In 1921, Taschenberg³⁴ reported a case in which he had used phenylhydrazine for one and a half years. His results were excellent in reducing the blood count and making the patient comfortable, and he encountered no ill-effects.

In 1923, John Dorsey of Baltimore reported a case in which he used the drug with very good results. This case was incorporated into the work of Trevor Owen.^{47,48,49} In 1924, Trevor Owen^{47,48,49} reported its successful use, and again in 1925 and 1926, he made further reports on the subject. In 1926, Perrin Young⁶⁰ found the drug safe and effective. But even as late as 1928, the drug was not recognized generally as being the treatment of choice in these cases and in that year, Harrop³⁰ still leaned toward radiation of the long bones as the test treatment. However, from 1928 to 1931 the work of Owen at Hopkins, and Allen^{1,2,3,4,5} and co-workers at the Mayo Clinic firmly established the use of the drug.

The case cited below was seen in August, 1929, and has been followed carefully over a period of

* Case reported to the Grace Hospital Staff.

two years, during which time checks have been carefully made upon all findings.

Case Report of R. M. Forty-five years of age. Female. White. Divorcée.

This patient was first seen in July, 1929, at which time she gave a history of frequent "sore throat" and was complaining of "bursting sensations" of the shin bones. She also complained of large blue tender areas in the anterior portion of the neck, as described by Pich and Kaznelson,¹¹ edema of the legs, marked shortness of breath, general weakness, and "splitting" headaches. She has also noticed that she is very sensitive to the heat, and has had marked sensory disturbances, such as was described by H. L. Christian.²⁰ She believed that the whole illness dated back to vaccination, one year and a half ago. At that time, she had what sounds very much like a phlebitis in the left leg. Her past history revealed only scarlet fever, which ensued after an operation for hysterectomy, and frequent bad "sore throat." Her family history was not relevant to the subject.

Physical examination revealed a woman with a very "muddy" skin. The extremities were quite dusky. There were three areas on the left side of the neck, about an inch in diameter, which were quite purple. These were palpable and raised above the surface of the skin, and were very tender. Her teeth, ears and nose were negative. Throat was negative. The heart was not large but a systolic murmur was heard in the third left interspace and at the apex, and was transmitted to the axilla. There was slight accentuation of the second pulmonic sound. The spleen was easily palpable, but not tender. The shin bones were very tender to touch. The skin was quite "glassy" over them. There was a sensation of fullness but not true fluctuation in this region. Red blood count 6,200,000. Hemoglobin 100%. White blood count 10,000. Differential, polys 80%. Urine is normal. Blood pressure 120/70.

Previous Therapeutics: She was sent to me by another physician who was leaving town. She had taken 25 1/10 grms. capsules of phenylhydrazine for polycythemia vera, given in the following manner: 1 capsule once a day for fifteen days. Then 2 capsules a day for five days.

For three weeks before her visit to my office, she had taken no phenylhydrazine. Her red blood count had been reduced during the three weeks of treatment from nearly 7,000,000 to 6,200,000, and she had had no treatment for three weeks, previous to seeing me. She was therefore given a prescription for a capsule containing 1/10th of one gram each of phenylhydrazine. As this could not be filled in town, Merck and Company sent a fresh supply of the drug to the local pharmacy, and the capsules were made up according to instructions. She began taking them on July 24th; after one month without treatment.

Because of the previous results, i.e., reduction from 6,800,000 to 6,200,000 from twenty-five capsules, each 1/10th of one gram, she was told to take two capsules a day. After she had taken these four days, i.e., eight capsules in four days, July 29th, she was seen again and was still complaining of the same symptoms. However, there had been a marked improvement of the "muddiness" and cyanosis of the skin, and the blue spots in the neck had entirely disappeared. The physical examination at that time revealed no changes but the red blood count was 4,500,000, hemoglobin 85%, white blood count 12,000. Polys 75%, eosinophiles 8%.

This rather spectacular drop in red blood cells made it seem wise to discontinue the drug, although she had not reached the minimum amount of 4,000,000 at that time. Two days later, she called to say that she was quite yellow. The urine was very dark in color and the stools black, but not bloody. She was seen immediately. The physical examination was unchanged except for an evident prostration and a very yellow color to the sclerae and the skin. The red blood count was 3,000,000, hemoglobin 70%, white blood count 20,000, polys 70%, eosinophiles 15%. The stools were "tarry" and contained gross blood. The urine did not contain blood but was very dark in color and gave a strong bile reaction. There was no pain over the liver or the kidneys. The blood pressure remained consistently the same as previously. The rather surprising reaction immediately made one suspicious that there had been a mistake either in prescribing the medicine or in putting up the prescription. The patient fortunately had one of the original capsules and a number of the new ones. These were very different in size,—the new ones being nearly twice the size of the old ones. This led to a great deal of worry until a visit to the druggist was made. It was found that the prescription had been written properly and upon weighing the different capsules, it was found that they each weighed 1/10th of a gram. The discrepancy in size was accounted for by the fact that the original prescription has been "tamped" and the second "scooped."

On the 2nd of August the patient got out of bed to care for an aunt who had a cerebral hemorrhage and rushed around the city most of that day. Naturally, on the following day, she was feeling very much worse and was completely prostrated. Her color was very much worse but she had had no "tarry" stools and the urine was lighter in color.

The red blood count was 2,300,000, white blood count was 22,000, polys 70%, eosinophiles 20%, hemoglobin 50%, blood pressure 110/60. The edema over the shin bones, together with the "bursting" sensations had entirely disappeared. Under the circumstances, preparation was made

for a transfusion the next day, but the patient was feeling very much improved and the prostration was much less. The red blood count was 2,200,000 and the hemoglobin was between 40 to 50%. It was deemed unnecessary to transfuse her. The smears of the blood on this day showed anisocytosis, poikilocytosis, and polychromatophilia, but only one nucleated red cell was seen in the smear. Two days later, the patient showed marked improvement subjectively. The stools and urine were light in color. There was a mild degree of headache and some shortness of breath. The physical examination showed no change. The blood pressure was still normal, and the pulse was 72. The red blood count was 2,300,000, hemoglobin 50%, white blood count 35,000, eosinophiles 20%, polys 64%.

On August 8th, the blood count reached 2,900,000, hemoglobin 60%, and the smear showed much improvement in the size and shape of the cells. The white blood count was 30,000.

On August 13th, the patient went to work, did not get very tired and felt quite well except for the shin bones which had become painful again, although the legs were not swollen. The red blood count was 3,300,000, the white blood count was 30,000, and the hemoglobin 60%.

Five days later, August 18th, she reported that she had been at work for five days and did not feel tired. In fact she had felt better for the past week than at any time during the last two years. The legs had become painful again while walking. The physical examination was unchanged. The red blood count was 3,900,000, white blood count 19,000, and the smear was nearly normal in appearance.

October, 1929. After a period of two months abstinence from the drug, she came in complaining of cyanosis of the extremities, dyspnea, and "bursting" sensations in the legs. At that time, the red blood count was 7,200,000, and the hemoglobin was 100%. She was given 4/10ths of one gram of phenylhydrazine in 1/10th gram doses at intervals of two days. One month later she came in feeling perfectly well with a red count of 5,000,000 and hemoglobin of 90%.

During the past two years, she has been seen frequently and it has been found after careful experimentation that she needs only 4/10ths of one gram of phenylhydrazine per month to keep her blood count in the neighborhood of 4,500,000. When the red count stays at 4,500,000 or below that figure, she is free from symptoms except for "bursting" sensations in the legs when she gets tired.

On a number of occasions during the last two years, she has attempted to withdraw the drug but has always found that her symptoms return so that she has resumed its use in 4/10ths of one gram per month or 1/10th of one gram per week.

SUMMARY

This is a case of polycythemia treated by phenylhydrazine.

(1) Two and five-tenth grams of the drug were given in 25 days with a reduction from 6,800,000 to 6,200,000 in the red blood count.

(2) A lapse of 24 days occurred without any treatment.

(3) Eight-tenths of a gram taken in 4 days caused a marked delayed effect and a very severe anemia.

(4) Recovery was made over a period of three weeks to normal count.

(5) A rise of red blood count from 2,300,000 to 7,200,000 occurred within 10 weeks after stopping treatment.

(6) She has been followed over two years when she has been in good health with normal counts averaging 5,000,000 on a dose of 1/10th of one gram each week.

COMMENT

In this case are clearly defined certain interesting features:

(1) The drug which was used first had been in the physician's office for a considerable time before it was administered and had about the effect one would expect in the average individual. It followed closely the recommended dose of I. L. Cabot⁶ and C. W. Stealy,³⁵ and the results were approximately the same as theirs.

(2) The freshly prepared drug produced spectacular and alarming results, in the same daily dosage, over a very short period of time. The total poisoning dose being 8/10ths of one gram,—this is far below the average recommended dose.

(3) The difference in the size of the capsule added a touch of humor and fright until it was found they each weighed 1/10th of a gram.

(4) As was pointed out by Harrop,³⁰ and Brown and Giffin,^{13,14} the cumulative effect of the drug is very marked. In this case a drop of 2,300,000 was noted after withdrawal of the drug in comparison with 1,000,000 previously reported by Owen.

(5) No mention of idiosyncrasy to the drug has been stressed in the literature, but it was evident from the startling result from a very small dose in this case and by the accumulative effect in the later history of controlling the red blood count by doses of 1/10th of one gram per week.

(6) Although the reaction was startling and more severe than other cases, no permanent damage to the liver or kidneys was found. This agrees with the findings of Huffman,³⁷ and Allen and Giffin⁵ in this regard.

(7) In contrast to Taschenberg,³⁴ it was found necessary to increase the dose at any time over a period of two years.

(8) The intimate correspondence of the erythromelalgia, "bursting" sensations, and the blue areas in the neck, with the height of the red blood count is also a very interesting point.

(9) As was shown by C. W. Stealy,⁵³ the white blood count rose in inverse proportion to the fall in the red blood count, and the eosinophiles also rose in inverse proportion, as was shown by Hay and Evans.³¹

(10) The history of phlebitis following vaccination is an interesting one and bears out the findings of Barta¹¹ that this condition is frequent in polycythemia vera, but it will be interesting to note whether widespread thrombophlebitis will develop as described by Horton and Brown.³⁶

(11) As yet no evidence of leukemia has developed although the white blood count was extremely high at the time of the blood reduction. All of the cells were of normal type. Cases of polycythemia resulting in leukemia were described by Daniels and von Buchem.²¹ Although Minot^{62,63} described pernicious anemia as an end result, no tendency of that kind has been shown in this case.

DOSAGE

That the dosage was not unduly high is amply

proved by a review of the sum of the doses used by others:

Trevor Owen recommended the use of 1/10 gram a day for 24 days. Total of 2.4 grams.

I. L. Cabot recommended the use of 1/10 gram a day for 20 days. Total of 2 grams.

Perrin Young recommended the use of 2/10s gram a day until the desired effect was obtained.

C. W. Stealy recommended the use of 2/10s gram a day for one month, and then reduced it to 1/10 a day for one month and then back to 2/10s gram for one month. On this dosage he reduced the red blood count to 3,000,000 but when he used 1/10 of one gram daily for one month, the red blood count averaged 5,000,000.

In closing the following points are once more brought forward:

(1) The drug should be freshly prepared.

(2) An idiosyncrasy to the drug does exist.

(3) Cumulative effect after withdrawal is very marked in this case.

(4) The drug is relatively harmless as far as permanent damage to the kidneys and liver are concerned.

(5) The drug is very effective in reducing the red blood count.

THE RESULTS OF ONE THOUSAND ASCHEIM-ZONDEK TESTS FOR PREGNANCY

By RAPHAEL KURZROK, Ph D., M.D., NEW YORK, N. Y.

Research conducted in the Departments of Obstetrics and Gynecology and Biological Chemistry and Sloane Hospital College of Physicians and Surgeons, Columbia University, aided by a fund from The Chemical Foundation and with the assistance of Sarah Ratner M.A., Stanley Goldman B.S. and Margaret A. Creelman, A.B.

IN a recent review of the literature on the Aschheim Zondek Test for pregnancy, Zondek collected a total of 5,515 cases. The present report covers 1,000 tests which were carried out under the supervision of the writer, who personally made all examinations of the ovaries. The error in diagnosis in Zondek's collected series was from one to two per cent. In the writer's series the error amounted to 12 per cent. Four hundred and sixty tests were positive, and five hundred and forty were negative.

The technique used in this present research followed closely the one originally advocated by Aschheim and Zondek. Six injections of 0.25 cc of morning urine were given over a period of three days, and all animals were sacrificed one hundred hours after the first injection. If the urine appeared to be contaminated, or if the mice appeared to be ill after a single injection, the urine was shaken with an equal volume of ether, the ether discarded, and the urine injected in the usual manner. Six mice were used for each test. A test was never reported as negative unless there remained at least three mice for autopsy, the ovaries of all of which were distinctly negative. If a single mouse gave a positive reaction the test was considered positive.

The indications for the test were those usually found in a large obstetrical and gynecological service. The cases included hydatid moles and two chorioepitheliomas. They will be considered in a separate publication. Interesting as were the number of correct diagnoses the cases in which the test failed were to us more interesting. The failures may be divided into two groups—incorrect positive (2 cases) and incorrect negative (10 cases) results.

(A) Clinically Found Not Pregnant—A-Z Test Positive (2 cases)

Case 1—This patient had been receiving injections of Prolan for several weeks prior to the test. The ovaries showed corpora lutea but no punctate hemorrhages. Microscopic examination of the curettings failed to reveal a pregnancy.

Case 2—This case was one of multiple fibroids, menopausal symptoms and amenorrhea for seven weeks. The ovaries of the test mice showed cor-

pora lutea but no punctate hemorrhages. The patient was curetted and the physicians reported that the macroscopic examination of the curettings failed to reveal a pregnancy. No microscopic examination.

(B) Clinically Found Pregnant—A-Z Test Negative (10 cases)

Case 3—Multiple fibroids and four months pregnant. The test was repeated one month later and a weak positive reaction was obtained.

Case 4—Pulmonary tuberculosis. Menstruation ten days overdue when the test was done. Curettage revealed an early pregnancy.

Case 5—Cardiac disease with beginning decompensation. Menstruation 11 days overdue. Curettage and microscopic examination of the curettings revealed an early pregnancy.

Case 6—Menstruation 5 days overdue. The test was repeated two weeks later and a positive result obtained. The pregnancy was later confirmed clinically.

Case 7—Menstruation one week overdue. The test was repeated three weeks later and found positive. Clinically confirmed.

Cases 8, 9—The menstrual periods were 10 days overdue. Subsequent tests were positive in each case.

Cases 10, 11, 12—These cases occurred early in our series. On macroscopic examination of the ovaries of the mice we were unable to interpret the findings correctly. The results were probably due to faulty technique. In the light of our present knowledge some explanation may be offered for the failure of the test to correspond to the clinical facts in some of these cases.

Case 1—This patient, with oligohypomenorrhea, had been receiving two to four hundred rat units of Prolan intramuscularly each week for a period of several months. We believe that there is a definite renal threshold for Prolan and that some of the injected hormone, in this case, was excreted in the urine. Since the Prolan that we used contained both the follicle stimulating hormone and the luteinizing hormone, in a ratio of about 9 to 1, it is quite likely that the urine when injected into the mice produced both ripening and luteinization of the follicles. The finding of

the corpora lutea we interpreted as a positive result for the test.

Case 2.—While it is quite likely that the physician was correct in his macroscopic examination of the curetting these were not examined microscopically. A thickened endometrium could be easily mistaken for an early decidua.

Case 3.—We have no reasonable explanation to offer for the negative test at the first examination and the weak positive reaction at the second test one month later. Both tests were done during the second trimester of pregnancy. The patient went to term and both child and placenta were normal. No errors in technique could be detected.

Cases 4, 5, 6, 7, 8, and 9 can be considered together. In these patients menstrual bleeding had failed to appear for five to ten days after the expected time. Our earliest positive test was in a patient in which the flow was one day overdue. We have never had a positive test before a patient had passed her regular period time. The factors determining the time of first appearance in the urine of the follicle-stimulating and luteinizing hormones (possibly also a hemorrhagic hormone responsible for the punctate hemorrhages or "Blutpunkte") are not known. Some theoretical considerations are, however, of some interest. Two factors which may greatly influence the time are the date of implantation of the ovum and the renal threshold for the hormones.

According to the most recent views of Fraenkel, spontaneous ovulation occurs between the 15th and 18th day after the onset of the last menstrual period. Fertilization probably occurs within 24 hours, and then migration of the fertilized ovum begins. The duration of the migration (according to a recent review of the facts by Grosser) is from 10 to 14 days, two-thirds of this time being spent in the tube, and one-third in the uterine cavity. Then implantation occurs. In a woman with a 28-day cycle this would take place slightly after the normal time for the onset of the next menstrual period and would correspond to the time of our earliest positive test.

On the other hand, Grosser places the limits of spontaneous ovulation between the second and the twenty-fourth day of the menstrual cycle. This opinion is based on the study of a fairly large number of very young embryos. Furthermore the statistics of Siegel, Pryll, Jaeger, Zangemeister show that the optimal time for conception lies between the 6th and 10th day following the onset of the menstrual period. We may assume that the ovum remains fertilizable for only 24 hours, and that the fertilization power of the sperm is about of the same duration. If in any instance ovulation occurs early in the menstrual cycle, for example, on the 6th day, we may add to this the average time of migration of the fertilized ovum, 12 days, and reckon the 18th day as the time of implantation. Such a case may

give a positive A-Z test several days before the expected failure to menstruate. If, however, ovulation takes place on the 24th day, and we add 12 days as the average period of migration, implantation would be expected to take place about 8 days after the normal time for the menstruation. Our cases of failure of the A-Z Test within 10 days after the expected onset could therefore be explained on the basis of such late ovulation.

Still another factor that could vary the time of ovulation, and hence, of implantation, would be the possibility of an induced, provocative or violent ovulation, induced by coitus or possibly by emotional stress or drugs. This type of ovulation is known to occur in the rabbit and in the cat. Heuser was the first to suggest this possibility in the human. Grosser, Chazan, Zangemeister, R. Meyer, Fraenkel, Triepel, Thomson and V. Moellendorff have also considered the possibility of induced ovulation.

We are accumulating some evidence that would seem to show a definite renal threshold for estrin and prolan A. It is very likely that prolan B may also have a renal threshold value. Patients with a high renal threshold would spill these hormones into the urine later than those with a low renal threshold and in this way the time of appearance of a positive A-Z Test might vary.

In addition to the 1,000 A-Z Tests reported, there were six positive tests of special significance in the study of sterility. The cases came from our Sterility Clinic. In each of these cases the test was positive within a few days after the expected time of onset of the skipped menstrual period. In these cases, normal menstrual flow appeared before the tests were completed. The periods were normal in every respect. The tests were repeated later and found negative. This small group of cases would tend to support the view that some "sterile" women become pregnant, but that for some unknown reason the embryo dies at a very early age.

SOME CONSIDERATIONS IN BUYING AND INSTALLING A FLUOROSCOPE FOR USE IN GENERAL PRACTICE

By CHARLES AUER, M.D., NEW YORK, N. Y.

IT has been truthfully said that the general practice of medicine can be and frequently is conducted with only that equipment which can be carried in a hand bag. Yet there are obviously other instruments which materially assist in the better diagnosis and treatment of disease—the basal metabolism machine, the quartz lamp, the diathermy and many others. Still we many of us postpone the acquisition of these articles for one reason or another; a doubt as to the general applicability to our particular practice, a thought as to the time consumed in operation of them, a question as to technical knowledge required, a hesitancy perhaps as to cost. Few of us, I think, but what sooner or later find ourselves asking the question: "Shall I get a fluoroscope?" Will such an instrument enable one to do better work, how much trouble is it to install, is there room in the office, what kind should be purchased, what will it cost and will the cost be justified? It is remarkable how difficult it is to get reliable answers to questions such as these beforehand and it is with this idea, through the recounting of my own particular experience, that this more or less haphazard article is written. No attempt will be made to describe an X-ray laboratory nor that heavy apparatus used by those who specialize in this work but rather what the busy practitioner with limited space in his office and limited time to devote to the subject will want to know before he commits himself to the purchase of that minimum equipment necessary to make this instrument a useful adjunct to his general work.

There are many makes of the upright fluoroscope on the market but they are mostly of about the same type and they do about the same work. There are, however, certain minor differences which will help decide which to take. It should be rugged and strong in appearance, with baked on enamel with a minimum of nicked parts to keep polished. It should be so protected that patients cannot get their bodies near the high tension. The moving parts should be not too complicated and should work smoothly. High tension reels and cords should be few or absent altogether. A large fluoroscopic screen (12 by 16) is an advantage. A groove on the back of the screen arm to support a cassette or exposure holder is most desirable. The best thing to do is to see as many makes as possible preferably those already set up and working in a doctor's office and preferably not too new. The cost of this machine complete with X-ray generator, filament transformer and oil immersed circuit

breaker, control panel, screen, and a good 30 M.A. tube and lead glass shield is about \$900 cash.

The accessories required in the operation of this machine are rather large in number and take some thought especially if one plans to take roentgenograms and self develop them, an almost necessary procedure in view of the great limitation in usefulness when fluoroscopy only is employed.

In the following list of general accessories some possibly useful hints have been appended to certain items. Costs are net and vary with different manufacturers. They prevailed during 1930 and 1931 but have been somewhat reduced since.

Hand timer for accurately regulating exposure time. Indispensable to the beginner. Cost—\$45.

Foot switch with room-light control. Cost—\$25.

Room light. May be used as pilot light also when rotary is used. Cost—\$2.

Lead-rubber apron and gloves. Cost—\$23.

Illuminating box. Cost—\$19.

Windows. This is a vexing subject. To render them totally dark even to sunlight requires heavy shades of leatheret enclosed in boxes and running in deep grooves usually constructed of metal. They are unsightly and not very efficient when a draught occurs. They are a necessary evil unless one's office happens to be equipped with the hard wood inside shutters sometimes found in private houses. In this case they can be made perfectly light tight with some black felt, glue and patience. Other windows opening upon hallways, etc. where there is but a dim light can be made dark with ordinary black window shades especially if the undressed side of the cloth is painted with ordinary black leather dye diluted with alcohol. Cost for rendering two large windows light tight in the usual manner—\$100.

Cassettes and exposure holders. At least two of the former will be required, one 14 by 17 and one 8 by 12 inches. Undersized films cannot be used in cassettes as they are apt to injure the tungsten screens. Plenty of all sizes of exposure holders should be on hand to accommodate films taken from the cassettes. Cost of two cassettes with screens—\$110. Cost of one dozen exposure holders—\$3.

Transformer and rotary converter. These may not be necessary unless some change in current is required. If direct current only is available then the rotary must be used. This is readily purchasable in the used market. Cost

cords and reels. The patient can be burned by the X-ray also but the fact that liability insurance rates are not raised by the use of X-ray for diagnostic purposes would seem to indicate that the danger is small. Static discharge can be largely obviated by having a metal frame at the back of the panel grounded to a cold water pipe. The operator must be completely protected at all times always using apron and gloves during fluoroscopy and keeping out of the direct rays during photography. An easy way to avoid the latter while making an exposure is to stand behind an open door, say the dark room door, on the back of which has been hung, on three hooks, the lead apron. Parenthetically it would be well to mention an annoying feature of a new lead apron. This is the soap stone used to preserve it which will not wash off with any ordinary means but which constantly sheds on one's clothing. This can be avoided by lining the apron with two layers of surgical gauze held in place at the edges with adhesive.

When a higher voltage is used (76 K.V.P. or over) in photography especially on damp warm days some trouble may be experienced with the high tension current jumping to the negative or to the grounded framework thereby ruining the film. This can be obviated by intervening at places where this occurs a layer of ordinary thick, rubberoid roofing felt. This material is an excellent insulator and, when heated, can be readily moulded to form a cap over the tube terminal or other situations of close approximation of the negative and positive high tension.

Too much emphasis cannot be placed on the necessity for the use of a definite routine procedure during fluoroscopy. This is well illustrated in the technique of fluoroscopic examination of the chest as routinely carried on at the Home Office of the Metropolitan Life Insurance Company, Medical Division.²

Records will need to be kept not only of the findings during fluoroscopy and of film interpretations but also details as to voltage, amperage, distance, etc., for all exposures for a long time so as to constantly correct technique. This will be in addition to marking, labeling, dating and filing of films.

If no tube stand is included, some ingenuity must be exercised in order to expose certain parts of the body correctly since the upright fluoroscope can send out rays horizontally only. Yet, with the help of sand bags, several small boxes neatly covered with towelling or gauze as supports and an ordinary good office treatment table it can be done. The best way to make a table roll freely is to replace the castors with a set purchased from the makers of quartz lamps. A chair with a head support is

of value in some cases such as in photographing the teeth where care must be exercised in getting the angles correct.

Dark room procedure is time consuming. The screens must be kept scrupulously clean and the cassettes protected from denting and warping. The solutions must be prepared carefully according to directions and losses due to evaporation and depletion made up constantly from fresh solution. At infrequent intervals the solutions will have to be entirely replaced. Finally the films need developing at just a certain temperature. This temperature is easy to maintain except in hot weather when quite large quantities of ice will be needed in the cooling chamber. Five minutes is consumed in developing, about twenty in fixing, but during this latter one is not confined to the dark room. Bathing takes another twenty minutes of intermittent attention and then the films are hung up to dry.

During the operation of the unit it will be necessary from time to time to call in the representative of the seller of the machine for the so-called service included in the purchase. If one is at all mechanically inclined these calls will be infrequent. The tendency is to over-emphasize to the prospective buyer the importance of this service.

The cost of operation, barring accident to the tube or other expensive parts is insignificant except for the cost of the films.

Interpretation will prove the most difficult part for the general practitioner and will depend largely on his previous experience and contact with the results of roentgenography. Association, without necessarily taking a formal course, with the X-ray department of an active hospital for a few weeks will be of immense value in this respect. Well-illustrated books on this subject are of some assistance but experience only will render one competent to interpret with reasonable reliability. A practice of following a routine procedure in fluoroscopy so that the normal as well as the abnormal is repeatedly observed as well as a habit of making an additional examination of the lungs and heart of stomach cases will serve to teach interpretation. Contact with the clinical aspect of his own cases gives the general practitioner some advantage. However, there will be certain occasions when it will be necessary to consult someone more expert in the reading of a film and opportunity to obtain this or the lack of it should be a consideration in the purchase of the equipment.

Assuming that one is about to purchase the minimum apparatus described above—an upright fluoroscope and dark room outfit—the question next occurs: "What will it do?" and "What are its limitations?" Few seem to real-

ize how much can be done with such limited means. Fluoroscopy of the throat, esophagus, stomach, duodenum, rectum, descending colon, heart and lungs are relatively simple and the results satisfactory. Foreign bodies and fractures can also be detected with the fluoroscope alone but negative findings are not conclusive. Excellent films can be taken of the skull (including the accessory nasal sinuses and mastoids), teeth, cervical vertebrae, lungs, heart, long bones and, with the exception of hip in stout patients, all joints connected with long bones as well as foreign bodies. However, the above is about the limit with any degree of satisfaction and certainty of results. This leaves a large field such as deep visceral photography, calculi, stereoscopic work, spine, etc., for which more equipment will be necessary. X-ray therapy is out of the question.

And, lastly, will it pay? Adding the cost of the various articles mentioned above gives the sum of \$1,684. This includes installation and first supplies and would be, of course, somewhat less for alternating current. As to how soon this will be made up in actual extra fees will depend on the type of practice. Among patients of moderate means many fluoroscopic examinations will be made without extra fee and photographic plates at but small extra charge but these cases will be retained under one's control that formerly drifted away or required to be referred to diagnostic clinic or hospital. This policy of utilizing the machine freely and frequently, almost routinely, and without too close a regard for the patient's ability to pay an extra fee most emphatically will pay in the form of more accurate diag-

nosis, wider range of work and those intangible factors that produce satisfied patients. If the original cost of the machine is spread over a period of ten years (after which it may be considered obsolete) and at the same time it is utilized often then the cost of an individual fluoroscopy is negligible and of films but little more except for the time expended in operation. It should be borne in mind that these films, within the capabilities of the machine, are not make-shift poor exposures but that, with painstaking attention to technique, films of the finest detail and contrast can be turned out which compare favorably with the products of professional laboratories and often excel them. In addition there are a few patients who consult chiefly for X-ray diagnosis especially those who are referred. These cases expect to pay extra fees which, together with small occasional extra charges made to regular patients, will, within a reasonable time, serve to write off the original cost.

In conclusion we would state that in our experience in a rather large general practice among people of moderate means the acquisition of an upright fluoroscope with dark room facilities, while attended with many unexpected details and while limited in its field of applicability, is thoroughly practical and profitable to the general practitioner and that limitation of space available need not preclude the utilization of this most interesting diagnostic tool.

RECURRENT PARALYTIC INTESTINAL OBSTRUCTION—REPORT OF A CASE OF UNKNOWN ETIOLOGY

By RICHARD A. LEONARDO, M.D., ROCHESTER, N. Y.

From the Surgical Service, Rochester General Hospital.

THE post-operative occurrence of a paralytic ileus is common enough, of course, and is frequently encountered after all sorts of laparotomies, especially early in the post-operative period. It is commonly considered as due to the operative trauma and exposure and the pathological lesion is primarily in the nerve endings of the intestinal musculature.

But, the occurrence of a paralytic ileus without any previous laparotomy is an entirely different matter. Besides, its incidence is extremely rare. Rarer still must be the occurrence of two distinct attacks of intestinal obstruction both due to a paralytic ileus, first involving the large gut, and

then, after a week, a second attack involving the small gut, in the same individual. I, therefore, feel it worth-while to report the following case which presented just such a condition and which, because of the absence of a better name, I have termed "recurrent paralytic ileus."

The etiology in this particular case is unknown although the probable cause is some abnormality in the retroperitoneal region with consequent stimulation of the sympathetic nerves and hence a paralytic ileus. There is no extended bibliography covering such a case—only a few scattered statements mentioning the fact that a paralytic ileus may follow gallstone, colic, renal colic, retro-

peritoneal hemorrhage*, sub-acute pancreatitis, spinal cord injuries, abdominal trauma and, finally, fractures of some of the long bones.

A detailed report of my case follows:

Name—Louis Scutiére.

Age—65. Record No. 75793.

Admitted Oct. 2, 1931—Discharged Nov. 4, 1931.

Chief Complaint—Pain in left side past two days.

Family History—Negative.

Past History—Married. 7 children. No serious illness of any kind.

Present Illness—On September 30, at night, complained of sharp non-radiating pain in the region of the left kidney. Pain lasted until Oct. 2nd when he was admitted to this hospital. When first seen by family physician a diagnosis of kidney colic was made. The patient was given $\frac{1}{2}$ gr. of Morphine subcutaneously and advised to take capsules of sodium-amytal (3 gr. each) one each hour until relieved. When next seen by physician he had taken 8 capsules and was very drowsy but still complained of persistent pain in the left kidney region and the upper left abdominal quadrant. When I first saw the patient some 36 hours after onset he was very drowsy, complained of considerable and persistent abdominal pain which had generalized throughout the abdomen and it was accompanied by frequent eructations of gas, and was also accompanied by failure to pass gas or feces rectally for past two days. Although slightly nauseated the patient did not vomit and an enema given at this time returned without result. A tentative diagnosis of low-grade intestinal obstruction was made and patient sent to hospital.

Physical Examination—Man, elderly, acutely ill, complaining of abdominal pain and distention. Head, neck, chest, heart and lungs were negative.

Abdomen—Moderately distended, slight tenderness everywhere, no rigidity, no masses.

B. P. 160/90. Pulse 100, good quality. Temp. 101°. Rest of physical examination essentially negative.

Operation—On Oct. 2nd sigmoidoscopic examination negative. Then, a laparotomy performed under gas and local. A moderate amount of free straw-colored fluid was found in the abdomen. There was a uniform, moderate distention involving the whole of the colon from the ileocecal valve down to the pouch of Douglas. *No mechanical cause* for the dilated large bowel and the clinical symptoms of intestinal obstruction could be found. This exploratory was done through a left para-median incision and the whole abdomen carefully examined. A routine appendectomy was then done and wound closed.

Oct. 7th—Jejunostomy performed under local

anesthesia for the relief of obstructed small bowel.

Laboratory Findings—

Urine—Repeated examinations entirely negative.

Blood—Oct. 2—WBC 13,200—N.P.N. 36—Chlorides 379

Oct. 6—WBC 7,600—N.P.N. 92—Chlorides 379

Oct. 7—WBC 6,200—

Schilling shows:

Myelocytes 2%

Juveniles 7%

Stab nuclears 43%

Segment nuclears 17%

Monocytes 6%

Sputum—Oct. 7—Negative for "pneumococci isolated from mouse."

Stomach Contents—Total acidity 2. Free HCL absent.

Blood—Oct. 8—N.P.N. 100—Chlorides 346—Sugar 125—Creatinin 4.3

Oct. 10—N.P.N. 120—Chlorides 400—Sugar 118

Oct. 12—Schilling shows:

Myelocytes 0

Juveniles 2%

Stab nuclears 37%

Segment nuclears 37%

Monocytes 4%

WBC 9,200

Oct. 13—N.P.N. 110—Chlorides 415—Sugar 121

Oct. 15—WBC 9,200

Schilling shows:

Myelocytes None

Juveniles None

Stab nuclears 29%

Segment nuclears 53%

Monocytes 5%

Oct. 19—N.P.N. 50—Chlorides 455—Sugar 138

WBC 10,200

Schilling shows:

Myelocytes 0

Juveniles 0

Stab nuclears 12%

Segment nuclears 63%

Monocytes 4%

Nov. 2—N.P.N. 29—Chlorides 430—Sugar 135

WBC 7,000 — Hemoglobin 78%—RBC 4,010,000

Schilling shows:

Myelocytes 0

Juveniles 0

Stab nuclears 8%

Segment nuclears 66%

Monocytes 5%

* A summary of such a case is appended to this article.

X-Rays—Oct. 2—Flat A.P. films of abdomen.

The colon is well outlined with the gas in it from the cecum down to the sigmoid. This shows considerable widening and is very suggestive of an obstruction in the region of the sigmoid.

Oct. 4—A.P. films of the chest; the diaphragms are elevated. No pathology is seen in the lung fields.

Oct. 7—Flat A.P. films of the abdomen: The loops of small bowel are rather widely distended and are in a ladder pattern across the abdomen. The colon is not dilated at this time.

Nov. 2—Flat film of the K.U.B. region. No evidence of pathology is seen.

Progress Notes—

Oct. 3—Considerable abdominal distention, slightly relieved following hypertonic salt sol. intravenously. Excellent gaseous result with milk and molasses enema. Expecterated some blood-streaked sputum.

Oct. 4—Great abdominal distention—expectorating blood-streaked sputum again. Respirations have increased—but examination of lungs shows only a few scattered rales both bases posteriorly. Patient receiving salt sol. subcutaneously, and hypertonic salt sol. intravenously. Jutte tube passed and 1000 c.c. of greenish fluid obtained.

Oct. 5—Jutte tube in all day. Cough has subsided. Abdomen still distended—passes no gas rectally.

Oct. 6—Milk and molasses enema with good gaseous results but after 3 hrs. patient vomited several times. Toward the end the vomitus was fecal. Jutte tube reinserted. Stomach washed out.

Oct. 7—Vomited watery fecal matter during night. *Flat plate of abdomen now shows definite obstruction of the small bowel, hence, enterostomy was done.* Since return from operating room the enterostomy tube has not drained. Jutte tube inserted and 1000 c.c. greenish fluid aspirated from the stomach. Temperature 103°. Patient feels better since gastric lavage.

Oct. 8—No drainage from enterostomy. Stomach aspirated and washed through Jutte tube. Patient getting plenty of salt solution subcutaneously, but blood chemistry findings are becoming progressively worse—N.P.N. 100.

Oct. 9—Enterostomy tube has drained a little during the night. Early this morning patient had a spontaneous liquid stool containing fecal mat-

ter and passed a considerable amount of gas. (This is patient's first stool since admission.) Apparently enterostomy tube drains best when patient is on left side. Patient very weak. Can retain nothing by mouth. Temp. 104°.

Oct. 10—Receiving glucose sol. intravenously in addition to 3000 c.c. salt solution subcutaneously each day. Patient was coughing again but physical examination fails to reveal any evidence of consolidation.

Oct. 11—N.P.N. 120. Patient's condition is unimproved. Retained a little broth today and thinks he is able to pass just a little gas rectally at times. The enterostomy tube fell out during the night. Abdominal distention is less, and patient is very weak.

Oct. 12—Profuse drainage from enterostomy wound, since tube fell out. Skin clips removed from both incisions. Taking broth and not vomiting. Schilling count more favorable today since the mature forms (the segment nuclears) are now 37% as against 17% on Oct. 7. Hence the prognosis is better.

Oct. 13—Condition much improved. Two spontaneous bowel movements today. Abdomen soft—distention gone—profuse drainage of fecal matter from enterostomy wound. Later in the day the patient had a third spontaneous bowel movement and now appears greatly exhausted as in a stage of mild shock with cold extremities and covered with a cold clammy perspiration. Temperature dropped to 99° and pulse to 90. Enterostomy wound is draining profusely and there is a slight irritation around it because of the digestive action of the intestinal juices.

Oct. 14—Profuse fecal drainage from enterostomy wound. Patient had several involuntary bowel movements today. He also has urinary incontinence.

Oct. 15—Two partially-voluntary stools today. Patient better. In the afternoon patient had seven liquid voluntary stools and was placed on anti-diarrheal medication.

Oct. 16—Diarrhea ceased. Enterostomy drainage is thicker and less abundant. Patient taking soft solids—fluids by mouth restricted.

Oct. 17—Six involuntary, formed stools during past 24 hours. Patient condition improved—out on porch yesterday. Abdomen flat and soft. Laparotomy wound remains clean and healed; enterostomy wound smaller, less irritated and drainage consists of formed feces in greatly diminished quantities.

Oct. 18—Two liquid voluntary stools past 24 hours.

Oct. 19—Four voluntary stools past 24 hours. Enterostomy wound filling in although slowly. N.P.N. down to 50 from 120 on Oct. 10.

Oct. 20—Feels better. One voluntary stool

past 24 hours. Very little drainage from enterostomy wound.

Oct. 21—Several voluntary stools. Sat up in bed for short time during morning. Getting saline subcutaneously only every second day now.

Oct. 22—Several voluntary stools.

Oct. 23—Condition improving. Patient wants to sit up in chair.

Oct. 26—Several spontaneous voluntary stools past few days. Enterostomy wound very small, permits very little drainage. The skin of the abdominal wall around the wound is entirely healed.

Oct. 28—Greatly improved.

Oct. 29—No drainage from enterostomy wound in past 24 hours. Bowels open. Sitting up in chair.

Nov. 1—Only very slight amount of liquid drainage from enterostomy wound in past few days. Patient stronger and anxious to go home.

Nov. 3—Final checkup before discharge—X-ray shows no dilated gut. Blood chemistry now practically normal. Blood count and Schilling differential are rapidly approaching the normal picture. Enterostomy wound still drains a little but does not require more than two dressings daily. Patient discharged in ambulance to be followed up at home.

Note: Patient placed on danger list on Oct. 11, 1931, and removed on Oct. 26, 1931.

Follow-up Note: Nov. 19, 1931—Enterostomy wound is entirely healed. Patient slowly gaining weight. Walks around home and yard. Has no abdominal distention nor any abdominal pains. Has regular bowel movements daily and uses mineral oil twice a week. Is satisfied and has no complaints.

Final Diagnosis—1. Paralytic obstruction of colon. 2. Paralytic obstruction of jejunum and ileum—cause of each unknown.

DISCUSSION

Possible causes of the paralytic obstructions:

1—The second paralysis (small gut) might conceivably be an ordinary case of post-operative ileus due to trauma and exposure subsequent to the exploratory laparotomy and appendectomy, but, it is probably more logical to assume that the

same unknown cause responsible for the first obstruction (large gut) is likewise the causative factor in the second one.

2—Idiosyncrasy to sodium amytal (through mistake this patient took 24 grains in 12 hours—although a large dose, not a toxic one; not a likely cause).

3—Most likely cause is that patient had a low grade, subacute pancreatitis with an intact peritoneum and an escape of pancreatic enzymes limited to the retro-peritoneal region and with a consequent involvement (over-stimulation) of the sympathetics, the inhibitory nerves of the gut. A few cases of recurrent ileus due to probable pancreatic pathology have been reported in the literature.¹

APPENDIX

As further evidence showing how retroperitoneal pathology may cause a paralytic obstruction of the bowel, I wish to briefly summarize the following case taken from our hospital ward records:

Mr. Guiseppe Guadagnino, age 75, Record No. 67501. Admitted: September 26, 1931. Discharged: November 7, 1931. History: Picked up semi-conscious in street after an auto accident; had fractured pelvis and numerous bruises. After two days patient presented clinical evidence of intestinal obstruction, and x-rays showed great dilatation of colon. Following day ecchymosis appeared in perineum and buttocks and the extravasated blood slowly gravitated to both ankles, posteriorly. Diagnosis of retroperitoneal hemorrhage with involvement of the sympathetics, causing a consequent paralytic obstruction of the gut was then logically made. Patient had a stormy convalescence but recovered entirely with conservative treatment—no operation was done at any time.

The occurrence of this second and somewhat similar case within a few days of my own, suggests the possibility that such cases may be more common than we now realize.

LATENT PNEUMOTHORAX. A CASE STUDY

By SAMUEL I. MULLER, M.D., LONG ISLAND CITY, N. Y.

THIS study is cited for its distinctive characteristics, viz.: Repeated or recurrent pneumothorax in the same individual; absence of tubercle bacillus in repeated sputum examinations; absence of demonstrable tuberculous lesions in the lung; absence of foreign body, tumor, atelectasis and history of operation; repeated incidence on the right side; spontaneous recovery.

Our individual is a young man, 22 years of age, married, white, American, at present a door-man, a position which he has held for four months, following a year's idleness in his usual occupation, that of jeweler. His family history is negative, both parents being alive and well and one sister in good health. He has been subject to frequent colds, until a year ago, but has never been seriously ill and these colds have rarely extended to his chest.

Present condition started six years ago at the age of 16 years. Comparison can best be made by charting the record.

LATENT PNEUMOTHORAX

Date	Side	Degree	Duration
1925	right	partial	two weeks
1928	right	slight partial	two days
1931	right	complete	four weeks

Because of the rapid amelioration of symptoms and due to the youth of the subject and the failure of the parents to properly grasp the significance of the condition, a proper study in two instances was not possible. In this last occurrence the subject was prevailed upon to submit himself to further study and observation. Examination disclosed an individual 6 feet 3 inches tall, weighing 156 pounds. On his first visit the *alae nasae* were moving with inspiration, which was 38 per minute, immediately after undressing for examination and subsided to 30 per minute on resting. There was pinched facies, with mild cyanosis superimposed upon pale cheeks and mucous membranes, joined with a tendency of the body to incline to the right side. There was distinct limitation of motion on the right side on respiration, with failure of retraction between the ribs on inspiration, impaired tactile fremitus, hyperresonant note over the entire right side, with soft, distant, amphoric breath sounds, particularly evident between the seventh and fourth ribs, posteriorly. One month later these clinical findings were gone. At two months, normal breath sounds persisted over the entire right lung and there was decided improvement in physical con-

dition, blood picture and an increase of six pounds in weight. History gives the best weight as 165 pounds.

X-RAY EXAMINATION

During Pneumothorax		After Recovery	
Right Lung	Completely collapsed; gradually expanding from above downward and from within outward, up to four weeks.	Right Lung	Is completely expanded at four weeks, free from tuberculous lesion; the bronchial tree to the middle and lower lobes is especially thickened, dilated and enlarged.
Left Lung	This is free from tuberculous lesion; the bronchial tree is marked and there is general congestion throughout the lung.	Left Lung	Is now free from congestion, otherwise the same.
Heart	Is definitely enlarged in all its diameters, especially widened over the auricles and the base of the aorta. The congestion of the left lung is due to cardiac embarrasment.	Heart	Is normal in size, slightly widened at the base of the aorta.
Diaphragm	On the right side is depressed below the level of the tenth rib and is immobile, the dome being lower than the left side.	Diaphragm	On the right side at its highest point is higher than the left side and is mobile.

In this case in the presence of a contraindication to the visualization by the use of iodized oil, visualization of the bronchial tree was obtained in a fair way by a change in the technique of the film development. When ready for development films were placed into developing solution just long enough to obtain an even blackness over the lung area and not long enough to have the other structures, as ribs, shoulders, scapulae, clavicles, heart and spine blend into the same shade. From then on the technique of washing and fixing is as usual. Advantage is taken of the fact that air inflated lung tissue permits passage of the x-rays more freely and that this area is therefore more readily developed. Development of the films until an even blackness covers the entire film results in the loss of detail obtained and desired. This technique is available in the study of bronchial structure and the changes taking place therein, when the rest of the lung, its coverings, the chest wall and other structures through which the rays must pass are not impaired.

skill in their execution, and others advanced in rank because of their excellent performance in the lower spheres of service. The change of administration is effected as usual without jar or friction; and the new policies of the officers are those which have developed in the natural course of growth and evolution.

THE HOUSE OF DELEGATES

The minutes of the House of Delegates, which met on May twenty-third, are published in full in this issue of the JOURNAL, page 732. The stenographic reports were read and transcribed, and prepared for publication within two weeks after the meeting. The principal element in making possible this new record for promptness is the fact that the Reference Committees and Delegates had had a month for considering the annual reports of the officers and committees; and so the discussions on the floor of the House were pointed and concise. The minutes of this year's meeting are therefore true reflections of the opinions and sentiments of the members of the

Medical Society of the State of New York to a greater extent than ever before. They have been edited with numbered paragraphs and cross references, so that any one can readily find the whole account of every topic that was discussed.

Minutes are often considered to be dry reading and to deal with formal subjects; but the twenty-four pages of this year's record are sprinkled with interesting discussions. Some members will be interested in the discussion on press publicity, and those with legal temperaments will want to note the changes in the Constitution and By-Laws. Every member will find something that will appeal to him personally.

IS MEDICINE A SCIENCE?

Popular magazines frequently carry articles exploiting the failures of doctors to cure or prevent diseases. Some of the articles place the blame on the individual doctors who fail to make the best use of the scientific knowledge that is available to them; while other writers assert that medicine itself is not an exact science, and that still less so is its practical application to people who are sick. Even doctors themselves often say that medicine is not a science, but is an art subject to the uncertainties of human interpretation and application.

The implication of the articles is that medicine lacks the scientific qualities which characterize many other professions. Let us compare medicine, which deals with the living body, with architecture, which deals with the houses in which men live.

Architecture is called an exact science. It is founded on mathematics which is as exact and immutable as any science can be. It deals with materials whose qualities and strengths are known; and the finished building embodies the plans whose preparation and execution the architect controls in their every stage.

The physician, on the other hand, takes a human body already formed. He seldom has any voice in its building, for people ignore the science of eugenics and consult the doctor only when the human mechanism is out of order.

The science of architecture, as well as that of medicine, is divided into three stages, or divisions:

1. Construction
2. Operation
3. Repairs

The popular fame of an architect rests principally on his ability in design and construction.

If the science of architecture is to be compared fairly with that of medicine, then the element of construction must be eliminated, and only the elements of operation and repair be considered.

After an architect has constructed a building, he turns it over to the owners for its operation. It is at this point that the analogy of architecture to medicine becomes apparent. The architect has as little to say about operating a building as a physician has about operating the human mechanism of his patient. If an architect were judged by the way in which an owner operates a building, his scientific reputation would suffer to the same degree as that of the physician. Men will subject both their buildings and their bodies to over-work, and neglect, and abuse, in spite of the warnings of the architects and their physicians. Most persons expect to operate both their buildings and their bodies to the fullest capacity; and then blame their scientific advisors for not making them fool-proof when they were constructed. The physician is as scientific as the architect in the operation of the mechanism with which he deals.

When one considers the third branch of the science of architecture, that of *repair*, the analogy to medicine becomes still more apparent. The repair of the human mechanism constitutes the greater part of the work of a physician; and he is called unscientific because he cannot reconstruct the human body by eliminating old parts and inserting new ones in their places. But if the architect were denied the privilege of eliminating old parts and inserting new ones which were worn out or broken or defective, his scientific reputation would suffer even more greatly than that of the doctor.

Suppose, too, the architect were denied the use of the blue prints of the plans of a defective

building, would his diagnosis be anywhere nearly as scientific as that of a physician? Could an architect take out defective parts and insert new ones while the vital activities of the building continued without danger? The scientific skill of the surgeon exceeds that of the architect, for the surgeon must not interfere with the vital process of any vital part of the body. The architect, for example, may cut off the pipes which carry water, heat, air, and electricity to any part of a building; but a surgeon dares not interfere with the

lines of circulation and enervation for even a few moments.

When one compares the science of medicine with that of architecture, or chemistry, or any other exact profession, the only fair basis is that similar standards shall be used. When one considers the natural limitations imposed on the physician, his work in operating and repairing the human mechanism is even more scientific than that of the architect in dealing with buildings.

LOOKING BACKWARD

This Journal Twenty-Five Years Ago

Medical Libraries: Dr. Albert Vander Veer has an article in this Journal of June, 1907, descriptive of the New York State Medical Library, which was established by an Act of the Legislature in May, 1891, and in 1907 contained 17,000 volumes. Dr. Vander Veer argued for its development as a circulating library.

The same Journal contains an article on State Aid for Medical Libraries, by Dr. Smith Baker, of Utica, who says:

"There are at present in the State some sixteen incorporated medical libraries, with an additional one at Utica, but just started, and the New York State Medical Library at Albany. Tabulating the number of volumes in the ten libraries heard from, we find a grand total of about 180,986 volumes. For the purchase of new books and periodicals there is used annually a sum derived from private and corporate sources of something under eleven thousand dollars, while the State contributes for its own library \$3,000—and additionally to the University of

Buffalo, for a like purpose, the magnificent sum of just \$100.

"A public medical reference and circulating library should be established in every city and village of any size in the State; and by way of encouragement, it can safely be said that probably no step taken since the organization of this society in 1807 can rightly be considered as of more importance both economical and educational than the successful establishment of such libraries would prove to be.

"Nor is it wise to say that this cannot be done or is not worth while. Wherever there are half a dozen medical practitioners there is the place to begin. First, by a mutual exchange of periodicals and books privately purchased; and then by such mutual agreement as eventually will prevent duplication and waste, and will secure greater variety as well as economy. If, by last will and testament, these accumulations are eventually made the nucleus of a central library, all the essentials of the subject are thus assured."

MEDICAL PROGRESS

Plethora Abdominalis (Dyspepsia Intestinalis Flatulenta).—Fr. Cramer says that he described in 1924 under the term "dyspepsia intestinalis flatulenta" a morbid picture in which the gastric and intestinal manifestations must be regarded as secondary symptoms, the results of obstructions in the region of the portal vein. The most striking phenomenon is the meteorism, due to abnormal collection of gas in the intestine. This is caused by portal obstruction, resulting in lack of resorption of the gas, especially in presence of reduced intestinal motility. The meteorism is commonly greater on the right side than on the left. Similarly the musculature of the abdomen does not react equally on the two sides, but does so much more weakly on the right. If the patient is asked to cough, the abdominal muscles contract more vigorously on the left side. The hindrance caused in the movement of the diaphragm results in disturbances of circulation within the abdominal cavity, especially in the liver. In plethora abdominalis an increase of blood pressure is also observed, which is favorably influenced by massage of the abdomen. If the obstruction continues for a long period, cirrhotic changes appear in the liver. Hyperemia of the gastric and intestinal vessels appears after eating, more pronounced in those who systematically overeat. The causes of this plethora are rooted in the mode of life of the patient, in his occupational habits, his abuse of food, in high living associated with lack of muscular activity. A sedentary life results in defective breathing. Long-continued superficial respiration is one of the main causes of plethora abdominalis. Increasing obstruction in the liver leads to enlargement of this organ, and the obstruction extends to the entire portal region. There is no doubt that through this long-continued obstruction the function of the liver becomes deranged. Treatment consists in a radical change in the habits of living. The patient must be made to understand that only by complete obedience to the orders of the physician can he hope to improve his condition. Since the trouble lies essentially in a disturbance of the circulation, digitalis is in order, as well as other cardiac remedies. Breathing gymnastics, massage of the liver, and carbonic acid baths are useful measures. Attention must be given to the regulation of the bowels; aloin is one of the best antispasmodics for this purpose. Oil enemata and vibratory massage are excellent measures. Smoking should be discouraged,

since nicotine has a selective effect on the intestine. — *Münchener medizinische Wochenschrift*, February 12, 1932.

The Significance of the Familial Type of Certain Hereditary Diseases.—In the opinion of O. Nägeli the present-day concepts of the action of the genes in building the constitution tend to reach rather too rigid conclusions. A quantitative difference in the working out of an Anlage should be possible, and would give a better insight into certain deviations in the appearance of a disease within the members of a generation or within several generations; for there is no doubt that such deviations exist. Such changes of manifestation are better understood by means of Goldschmidt's concept of the dynamic working out of the gene, and of the quantitative differences caused thereby; but it cannot be doubted that we must reckon with a changed hereditary constitution, such as is shown by great numbers of family trees. Too little attention, however, has been given to the fact that in one family there is a constant tendency to a severe type of a given disease, and in another family to a mild type of the same disease. The prognosis must then be given, not along general lines, but by consideration of the particular type of the disease that prevails in the family in question. An extraordinarily clear example of this is shown in constitutional hemolytic anemia, in which there is one familial type of extreme malignity, and another of striking mildness. This disease is marked by different constitutional structure of the red blood corpuscles, and is characterized also by microcytosis. Yet in all Nägeli's cases the average size of the red cells has been above normal. It can only be, then, that these blood cells have taken on a more spherical form, and this is the most important fact; for everything else may be absent in this mutation. Cases have been observed in which the affection was so mild that it was never diagnosed. A further classic example is offered in hemophilia. Families are seen in which numerous deaths from bleeding have occurred in early years of life; while other families exist with clearly demonstrated manifestations of hemophilia, in which there has never been a death. Nervous diseases exhibit these mutations, as for example Recklinghausen's disease, atrophic myotonia, Friedreich's disease, syringomyelia, spastic spinal paralysis, etc. It will be the task of the future to test these relations and discover their practical significance. The field

of nervous diseases offers especially rich opportunities of this kind.—*Schweizerische medizinische Wochenschrift*, February 20, 1932.

The Coincidence and Reciprocal Influence of Diseases.—R. Rössle says that the attention of physicians has from time immemorial been drawn to the coincidence of attacks of diseases of different kinds. Lotze attributed this to "sympathy." In order to have a clear idea on the subject, it is necessary to distinguish between those combinations which are based on a natural law, and those that are accidental. In the former class, again, we must differentiate those diseases in which one follows the other in succession, and those which have to some extent a common pathogenesis. To the former class Pfaundler gave the name "syntropies," to mean the tendency of two diseases to meet in one. The syntropy of severe affections is much more frequent according to autopsy findings than according to clinical impression. The concept of syntropy embraces the idea that all sicknesses are combinations of diseases, and must of necessity be so. Since then we have learned to recognize "syndromes" as the outlet of individual "diseases"; in these there may appear phenomena of opposite polarity for the functioning of one and the same organ, as for example menorrhagia and menopause in Graves' disease, or diarrhea and constipation in Addison's disease. Among "syndromatic" diseases are found particularly those of endocrine organs, the so-called pluriglandular diseases. It is possible now to speak of true biglandular diseases. The question may be asked, how is it possible to know what combinations are accidental, and what ones obey a law? Hitherto statistical investigation has been the usual method for such determination, but there will always be room for medical intuition in this field. Thus, for example, we may recognize the inexplicable coincidence of hemolytic icterus with tower skull, and of cirrhosis of the liver with lenticular degeneration in Wilson's syndrome; but we do not know the nature of the relationship, whether the lenticular disease is dependent on the liver disease, or whether both have a common origin. Another illuminating example is the coincidence of epithelial tumors with the generalized form of osteodystrophia fibrosa cystica. The syntropy of rickets and spasmophilia may also be recalled, and that of obstipation and eclampsia. It must be acknowledged that our present knowledge of the internal connection of the parts of the organism is still very faulty. Thus we do not know why there is a syntropy between pulmonary stenosis and progressive pulmonary tuberculosis, and a negative syntropy between the latter and mitral stenosis;

but we can see in this fact how closely syntropies are related to the problems of disposition.—*Deutsche medizinische Wochenschrift*, January 20, 1932.

The Effect of Calcium Upon the Heart.—A. Zarcinas says that since Billigheimer (1924) and Singer (1929) made their reports on the similarity of the action of calcium and of digitalis upon the heart, a number of other attempts have been made to determine how calcium combined with digitalis affects the heart under pathologic conditions. Zarcinas himself observed that calcium administered alone had a favorable effect in mild cases, such as those of extrasystole. These mild disturbances in the conduction system of the heart are usually caused by general nervous conditions, and it is for this reason that the use of calcium as a regulator of the vegetative nervous system, on the one hand, and as a cardiac stimulant, on the other, is doubly indicated. A case is reported in which strong extrasystoles occurred at every third or fourth beat without the patient being aware of it, and in which quinidine had produced no effect. As soon as 5 c.c. calcium gluconate was injected intravenously, the extrasystoles disappeared. Six further injections of the same amount were given at 3-day intervals, after which in the last week of the treatment 3 ampules of 10 c.c. each were similarly administered. This resulted in permanent cessation of the extrasystoles, with disappearance also of irritability and nervousness of disposition that had been prominent symptoms. The various patients who have been treated in this way have all responded well to the method. In no case have there been disagreeable secondary symptoms; all that has been observed is a rather pleasurable sense of warmth. Zarcinas thinks that this simple remedy, with its very prompt action, should be regarded as of great value in the present age, when engagement in sports and in occupations that produce nervous tension is so widespread, and so frequently causes extrasystoles to appear.—*Münchener medizinische Wochenschrift*, March 4, 1932.

The Effect of Cardiac Arrhythmias on the Operative Risk.—T. Jenner Hoskin, writing in the *Practitioner*, April, 1932, cxxviii, 4, emphasizes the importance of being able to judge accurately of the cardiovascular condition prior to operation. One of the most difficult problems likely to confront the surgeon is that of cardiac arrhythmias. Sinus arrhythmia of itself is of no importance, though it is occasionally found in diseased hearts as well. The diagnosis of this arrhythmia is not difficult, as it disappears on holding the breath or raising the heart rate by exercise. It becomes more

marked on deep breathing. The significance of sino-auricular block depends upon the intensity of the symptoms; if these are absent or slight, the condition would not affect the operative procedure. Ectopic beats may be brought about by any factor causing either decreased excitability of the sino-auricular node or increased irritability in any other part of the heart. In Hoskin's opinion, they are due to the latter condition. Ectopic beats may be either extrinsic or intrinsic. When extrinsic, that is, due to a cause outside of the heart, such as increased intraabdominal pressure, they have no significance as regards the integrity of the heart. Intrinsic premature beats are due to some cause within the heart itself, most commonly a toxic myocarditis. Their significance depends upon the results of clinical and electrocardiographic findings. Their presence in an elderly man with enlarged prostate requiring operation demands careful consideration as to the nature and extent of the operation the heart will stand. Both auricular and ventricular premature beats in patients with cardiovascular degeneration are an unfavorable sign. Physiological bradycardia is of no significance, but slow pulse due to ectopic beats alternating with normal beats (these ectopic beats failing to reach the radial pulse) and to partial or complete heart block indicate serious myocardial damage. These conditions contraindicate all operations other than those of dire necessity. Auricular fibrillation is commonly found in four conditions, namely, acute infections, myocarditis (Graves' disease), and myocardial degeneration, and secondary to mitral stenosis. Hoskin found auricular fibrillation in 10 per cent of 366 cases of Graves' disease. Removal of the greater part of the diseased thyroid tended to restore normal rhythm in 50 per cent of these cases. Auricular fibrillation with myocardial degeneration naturally makes operative risk very much more serious. Paroxysmal tachycardia, due to a run of ventricular ectopic beats, is more serious than the auricular and nodal types. Cardiac arrhythmia is not uncommonly found in cardiovascular syphilis, and patients with this affection stand operation badly. Therefore its presence or that of a positive Wassermann reaction increases the operative risk.

Treatment of Typhoid and Paratyphoid Fever by Vaccinotherapy (Bacteriotherapy).—According to L. Nove-Josserand, Euvrard and Feuillade, who write in the *Journal de médecine de Lyon*, of March 5, 1932, typhoid or paratyphoid vaccine (TAB stock vaccine or auto-vaccine) if administered very early, before the 8th day if possible, and at latest before the 12th day, with due observance of cer-

tain definite rules, has been found extremely efficacious for producing rapid and complete cure, generally in less than 25 days. When employed according to the rules the method, known as vaccinotherapy or bacteriotherapy, seems not to present any dangers. It is applicable to all ages and has been used effectively in children, adults, and aged persons. It appears to prevent the complications of the 3rd and 4th weeks of the fever, and has the advantage in times of large epidemics, when specialized nursing service is difficult to obtain, of dispensing with the need of cold baths and antipyretics. The earlier it is injected the more favorable its effect upon the course of the disease. If autovaccine is to be employed, a hemoculture must be made on the second or third day of the fever if possible, and at very latest on the 1st or 2nd day of the 2nd week. This makes the use of auto-vaccine somewhat difficult, so that the authors advise giving an initial subcutaneous injection of an average dose (300 millions) of a typhoid-paratyphoid stock vaccine while awaiting the result of the blood culture, which for one reason or another may, moreover, be negative despite the existence of typhoid or paratyphoid infection. To have waited for this result is to have lost invaluable time. The authors have been using the subcutaneous method of injection, which they regard as the only useful one. According to the age, size, and apparent resistance of the patient, a dosage of 250, 500, or 1,000 million germs give the best results. In actual practice, if it is later than the 4th or 5th day, and if the patient is young and weak, it is more prudent to test his susceptibility with 300 or 500 millions. Sometimes the fever curve yields rapidly and a second injection is not necessary. As a rule the third injection accomplishes nothing. A maximum of 3 injections, in 12 to 15 days at most, should accomplish complete apyrexia by the 21st day. The mechanism by which the vaccine acts is still unknown, but it is probably that of immunity. Twenty-three cases have been treated, with a single death in a patient recently operated on for ulcer and pyloric stenosis. These very gratifying results were accomplished by autovaccinotherapy, unaided by any other form of treatment.

The Mechanism of Action of Physiological or Natural Laxatives.—E. Lenz defines natural laxatives as those in which the "natural" factor lies chiefly in their point of attack and their mechanism of action, and not so much in their material origin. Regarded from this point of view, a laxative is the more natural, the more its mode of action is based on or supported by the physiological processes connected with the normal formation and transforma-

tion of the intestinal contents. The normal motor function of the intestine exhibits a well-proportioned division into that of mixing, retention, and transportation. Lenz thinks the bacteria of the colon play an important teleological role, in that by disintegrating the fecal mass they split up gases, acids, etc., which excite the mucous membrane and thus furnish the natural irritation that produces the strong peristalsis of elimination. It appears that the mucous membrane contains specific chemoreceptors which respond to these bacterial disintegration-substances and give the signal for the setting up of a great peristaltic reflex. Chemical influences exerted by the intestinal content upon these chemoreceptors are decisive for the regulation of the intestinal motor function. Substances which act in this way upon the motor function of the small intestine are soaps, glycerin, peptone, amino-acids, glucose, and lactose. In the large intestine the natural excitants of the mucous membrane seem to be, in greatest degree, the products of bacterial disintegration, for example products of fermentation of carbohydrates, such as volatile fatty acids—acetic acid, butyric acid, valerianic acid, caprylic acid, etc. Next to these stand gases, such as carbonic acid gas, hydrogen, etc. Other alimentary irritants that arouse peristalsis through action upon the mucous membrane are lactic acid (from fermentation of milk sugar), fruit acids, and etheric oils found in spices. Diffusible colloids which through their capacity for promoting water retention make the feces plastic are contained in vegetable food rests—hydrocellulose, hemicellulose, pentose, pectin substances, etc. Substances which cause the fecal mass to slide easily through the intestine are agar-agar, whole flaxseed, psyllium seed, mineral oil, olive oil, and butter. Saline laxatives act by dissolving the neutral salts that are retained tenaciously in the feces. These, as well as the plastic remedies and the anthraquinones may best be called “natural laxatives in the wider sense,” suitable for continued use in small, well regulated doses calculated to avoid producing “foreign body irritation.”—*Schweizerische medizinische Wochenschrift*, March 12, 1932.

The Symptomatology of Angina Pectoris.—

The question is raised by Hans Eppinger in the *Deutsche medizinische Wochenschrift* of April 8, 1932, whether in cases of angina pectoris one is sometimes justified in assuming a causal connec-

tion between the pain of the angina and certain anatomic anomalies that may be present. It is possible that an exact analysis of symptoms may throw some light on the subject. For instance, if the retrosternal pain appears chiefly during the exercise of a muscular movement, the prognosis is not so unfavorable as when the attacks appear during rest or in sleep. In the former case the angina generally reacts well to vasodilator remedies, while in the latter a treatment with digitalis will as a rule temporarily overcome the attack. Not only the symptomatology but also a description of the manner in which the pain starts deserves close attention. Eppinger gives an account of two types of attacks of retrosternal pain, both of which occupy a special place in the picture of the great symptom complex of angina pectoris, on account of the quality of the pain. These types are illustrated by two cases which the writer observed carefully for a long time, clinically, and which he was able to study anatomically afterward. In the first a paraesophageal hernia of the diaphragm was established roentgenographically, to which the original difficulty of the patient in swallowing could be attributed. It may be supposed that the hernial sac caused a temporary stricture of the esophagus; that the hernia was at first reducible; the patient must have had pain regardless of whether the stomach lay in the sac or could still slip out of it; that gradually the content of the sac became fixed in the region of the top of the hernia; an ulceration may have developed, through which the stomach gradually became adherent to the pericardium; thus this injury of the coronary vessels might be regarded as the actual cause of the fatal angina. The peculiarity that owing to the participation of the stomach in the diaphragmatic hernia, attacks appeared at the end of an act of swallowing, which were of the same kind as are wont to occur spontaneously when the coronary vessels are strained, gives this case a special significance. In the second case typical anginal pains appeared, but radiated to the right arm instead of to the left. The roentgenogram showed a distinct curve of the esophagus to the left at the level of the arch of the aorta, and revealed the characteristic picture seen in complete persistence of the right arch of the aorta. This, with the radiation of the pain down the right arm exclusively, suggests that there was a congenital anomaly of the anlage of the aorta, with the possibility that the sympathetic fibers leading to the heart had assumed a changed topographical relation to the spinal cord.

LEGAL

NEGLIGENCE ACTIONS — MENTION OF INSURANCE, GROUND FOR MISTRIAL

By LORENZ J. BROSNAN, Esq.

Counsel, Medical Society of the State of New York

In one of the Pacific coast states, quite recently a decision was rendered by an appellate court that is of constant interest in the defense of damage suits for personal injuries, whether based on malpractice or otherwise. The action was one in malpractice against a dentist, based upon his alleged negligence in removing an impacted tooth.

The case was tried before a jury and there was a judgment for the plaintiff. While the plaintiff was on the stand and was being examined by her own counsel, he requested her to relate a certain conversation she had had with the defendant dentist. Though there were repeated objections, she gave the following testimony:

"In regard to reimbursing us for doctors' bills. . . . Reimburse us for the expenses of the doctor; that it was out of his hands, and would have to be handled through his insurance."

The defendant's counsel immediately claimed that the asking of the question and the giving of the answer was such prejudicial misconduct as to require the court to order a mistrial. The trial judge, however, ordered the answer stricken from the record and directed the trial to proceed. On appeal, the higher court sustained the defendant's contention and reversed the judgment. It stated that the eliciting of evidence concerning insurance carried by defendant is so inexcusable that extremely stern measures are called for when such a practice is indulged in by counsel.

The appellate court referred to an earlier case in the same state as authority. In that case, which was a damage suit to recover for death alleged to have been caused by the negligent operation of an automobile, the following excerpt from the record makes clear the point at issue:

"Q. After the death of your husband, Mrs. S., did you have any conversation with Mrs. R.?

A. I did.

Q. State what that conversation was, . . . relating to the bringing of this suit and making a demand upon Mrs. R.?

COUNSEL FOR DEFENDANT: We submit that it is immaterial whether she made demand on Mrs. R. when she brought suit. . . . I have an idea it is an attempt to bring in extraneous matter here that has no relation to this matter.

THE COURT: I think I will overrule the objection.

A. I told Mrs. R. I was going to bring suit, that I thought I ought to get damages. . . . she said she didn't want it to cost her a lot of money but she realized it and that is the reason she had insurance.

DEFENDANT'S COUNSEL: If the court please, I assign the asking of that question as misconduct on the part of counsel, injecting extraneous matter into this case, and I now move that this jury panel be discharged and this case adjudged a mistrial.

THE COURT: The testimony about the conversation will be stricken out and the jury admonished when a matter is stricken out it is not to be considered by you in any way, it is to be considered the same as if no such testimony had been given or called for. The balance of the motion will be denied."

The court in its opinion ordering a new trial said:

"It must be presumed that counsel for the plaintiff knew the answer which his client would give to the objectionable question. Her answer could serve no purpose, except to get before the jury the fact that the appellant carried indemnity insurance. . . . The natural tendency of a line of examination that suggests to the jury that the defendant is indemnified against any judgment for damages against him is highly prejudicial to his rights, especially in a closely balanced case where the evidence otherwise would be easily sufficient on appeal to support a verdict either for the plaintiff or for the defendant. Such attempts on the part of counsel have frequently been held to be improper and prejudicial."

The rule that has been laid down in New York is similar. A few instances taken from the reported cases will well show its application.

In one case an employee sued his employer to recover damages for injuries received while using a press in a bookbinding establishment. In the course of his summation before the jury, the plaintiff's counsel stated:

"There is no evidence that he (the defendant) was insured; most of these people are. There is no evidence that there was anything of this kind here."

At that point the opposing counsel took exception to the remark and requested that a juror be withdrawn and a mistrial declared. The court denied the request, and the plaintiff's counsel added the further remark that "many people get insured, but there is no evidence of any such thing in this case at all." While the court instructed the jury to disregard these statements, on appeal the court reviewing the record of the trial ruled the remarks to have been entirely improper. The appellate court said that such statements of counsel had been designed to influence the jury by considerations which were not legitimately before them. A new trial was, therefore, ordered.

In another case a plaintiff brought suit against

a city based upon personal injuries claimed to have resulted from his falling upon an icy sidewalk of the city. The summation for the plaintiff included the remark to the jury: "You don't imagine for a moment that the city is going to pay. You know well enough who is going to pay." The statement was objected to. While no request was made to withdraw a juror or to impanel a new jury, the appellate court reviewing the matter ruled that the remark was manifestly improper, to the prejudice of the defendant. A new trial was accordingly ordered.

Another case where on appeal a new trial was ordered because of similar improper statements made in conducting cross-examination, is likewise of interest. A laborer working about a coal truck was injured by a crank-handle striking him on the head. A doctor was called on behalf of the defendant to testify regarding a physical examination he had made, on the question of the nature and extent of the plaintiff's injuries. The physician was cross-examined by the plaintiff's attorney and in the course of a line of questions was asked: "Q. You are the physician for the insuring company in this case?" His reply was evasive, stating merely that he was the physician for the defendant's attorney. A motion was made for the withdrawal of a juror, and denied. The appellate court reversed a judgment for the plaintiff, branding the question as improper for it conveyed to the jury the direct information that the defendant was insured.

A similar situation is revealed in another case where the offending questions and answers came from the direct examination of one of the plaintiff's witnesses. The situation as described by the appellate court was as follows:

"The plaintiff . . . called his brother, who testified that he had an interview with Mr. B, the general superintendent of the defendant, in the presence of a man to whom he was introduced by B. The witness was asked what B said when he introduced this gentleman, and, under objection and exception, he answered, 'I will introduce our representative, Mr. J.' He was next asked, 'Who did he say this gentleman, J, was?' Subject to objection and exception, he answered, 'From the insurance company.' The defendant's counsel then insisted that it was improper to ask a question which the attorney knew would elicit an improper answer, and asked the court to withdraw a juror and declare a mistrial. The court did not rule upon the motion, but made a distinct ruling that the evidence should stand, and the defendant again excepted.

"Subsequently another witness for the plaintiff testified to an interview with Mr. B, and stated that two attorneys were present at the time. He was asked, 'Where did they tell you they were coming from?' The answer was, 'X Insurance Company, I think they said.' There was no objection or exception to this question, and no motion was made by either party to strike out any of the evidence relating to the subject of insurance.

"Later on in the trial after one R had testified for the defendant, a paper purporting to be a statement made by the witness was offered in evidence to contradict him. The last words of the paper were: 'I made the insurance com-
ed my name.' The

defendant objected to the admission of the paper upon the ground, among others, that it was an effort 'to introduce in evidence and to give to the jury certain information which is improper, incompetent and immaterial,' and in this connection counsel particularly called the court's attention to the last clause in the statement as quoted above. The objection was overruled and the defendant excepted."

Counsel for the plaintiff attempted to justify his position by asserting that the answers objected to were unexpected by him. The court, however, said in reversing the judgment:

"If the answers were unexpected, as claimed, it was the duty of the plaintiff's counsel himself to move to strike out the evidence and to ask the court to instruct the jury to disregard it. Although warned by objection and exception, he had brought it into the record, and when he knew that it was not what he expected, but something highly improper, he should have lost no time in getting it out of the record and doing his utmost to correct his mistake. A prompt withdrawal of the evidence by the counsel for the plaintiff would go farther toward correcting the evil than any motion made by the attorney for the defendant. While there was no proof in this case that the defendant was insured, by suggestion and indirection the jury were given to understand that such was the fact and the result, apparently, is reflected in the verdict.

"Evidence that the defendant in an action for negligence was insured in a casualty company, or that the defense was conducted by an insurance company, is incompetent and so dangerous as to require a reversal even when the court strikes it from the record and directs the jury to disregard it, unless it clearly appears that it could not have influenced the verdict."

It is true that the law of this state does afford to the attorneys for the plaintiff an opportunity to bring before the jury, by way of suggestion if nothing more, the fact that the defendant is insured.

Section 452 of the Civil Practice Act provides as follows:

"The fact that a juror is in the employ of a party to the action; or, if a party to the action is a corporation, that he is an employee thereof or a shareholder or a stockholder therein; or in actions for damages for injuries to person or property, that he is a shareholder, stockbroker, director, officer or employee, or in any manner interested, in any insurance company issuing policies for protection against liability for damages for injury to persons or property, shall constitute a good ground for a challenge to the favor as to such juror."

This provision has been added to our law on the theory that a stockholder or employee of a casualty company might very well make an objectionable juror to the plaintiff. Under this provision, when the jury is being chosen, before any of the testimony is put in, questions are frequently asked on the examination of prospective jurors such as the following: "Are you interested as a stockholder or director in any insurance company that insures against liability for injuries to person or property?" It seems to us that this question is the equivalent of stating that the defendant is insured. Certainly, the average jurymen would so understand it,

TREATMENT OF DUODENAL ULCERS AND CHRONIC APPENDICITIS

A man forty-two years of age was referred by his family physician to the defendant doctor who specialized in the treatment of diseases of the stomach. A note from the family physician which the patient gave the defendant read: "Suspect duodenal ulcer. Kindly care for the patient." A history taken from the patient showed that he suffered from pain in the epigastric region extending to the back, which was relieved by eating, and further that the patient had been frequently awakened at night with severe pain, which was relieved somewhat by drinking milk. He told the doctor that he had lost thirty pounds from the malady.

The defendant doctor took numerous x-rays of the patient's stomach, intestines, gall-bladder and appendix. Examination of these showed several small duodenal ulcers, ptosis and chronic appendicitis. The doctor immediately sent the patient to a sanitarium and put him under a course of treatment which consisted chiefly of keeping him on a carefully supervised diet of cream, milk, broth and gruels for about three and a half weeks. The patient left the sanitarium greatly improved. He continued to call at the doctor's office twice a week for the next month, at the end of which time further x-rays were taken. These pictures disclosed that the ulcers had improved, but that the patient still had the chronic appendicitis with adhesions.

On the occasion of the first visit and on numerous occasions thereafter, the doctor told the patient it would be necessary for him to submit to an operation with respect to his appendix, but the patient delayed consenting to this operation.

After about nine weeks, the man was again sent to the sanitarium and put on a diet. The appendix condition was then so troublesome that, failing to obtain the patient's consent to an operation, the doctor treated the condition with applications of icebags. After a week the patient again left the sanitarium, and then called at the doctor's office for an x-ray examination. Again the condition appeared satisfactory except for the chronic appendicitis, and again the doctor told the patient of the need for operative treatment. Nothing further was heard from the patient until suit was brought by him against the doctor.

The claim upon which the suit was based was that the defendant doctor had treated the patient by a starvation diet for duodenal ulcers, whereas he was suffering from appendicitis, and that due to the improper treatment of the defendant an operation was necessary to remove the appendix. The case was tried before a judge and jury, and though no medical testimony was introduced on behalf of the plaintiff the judge sent the case to the jury. After about five minutes' deliberation, the jury returned a verdict for the defendant.

ALLEGED NEGLIGENT PLASTIC OPERATION ON NOSE

A young man, about thirty years of age, consulted the defendant, a specialist in nose, throat and ear cases. The doctor found that he had a marked retronasale nose with atrophic rhinitis. The doctor took two Wassermann tests but these were reported as negative. He gave him treatments from time to time of scarlet red emulsion into his nostrils. After this treatment had been continued for some time the patient requested that his nose be operated upon because he had been finding difficulty in obtaining employment by reason of his peculiar shaped nose.

The doctor put him under a general anaesthesia and took a piece of bone from the vertebral border of the left scapula which he shaped so as to make a nose bridge and then opening the flap of the plaintiff's nose, he incised at the junction of the nose and lip and placed the bone graft into position. After the graft had been finished the doctor sutured the flap and bandaged the patient's nose. The patient remained in the hospital for about a week and then went home.

The patient, thereafter, called at the doctor's office two or three times a week for several weeks and all went well with the case until about seven weeks after the operation the doctor discovered a small sinus had formed on the left side of the bridge of the nose which was discharging serum. The doctor applied dressings to the sinus and the patient continued to call at his office weekly for about three months for similar dressings. The last time he saw the patient the wound on the shoulder had entirely healed, but the sinus was still causing the patient slight trouble.

Suit was instituted against the doctor, claiming that the operation was improperly performed so as to cause a chronic infection about the nose which led to a permanent impairment of the plaintiff's health and a disfigurement of his face.

The case came on for trial before a judge and jury and at the close of all the evidence a motion which was made on behalf of the defendant to dismiss the complaint was granted, thereby terminating the matter in favor of the doctor.

HOUSE OF DELEGATES

MINUTES OF ANNUAL MEETING, MAY 23, 1932

The 126th Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Hotel Statler, Buffalo, New York, on Monday, May 23, 1932, at 2:00 P. M.

Dr. John A. Card, Speaker; Dr. Daniel S. Dougherty, Secretary.

The Speaker: The House of Delegates will please come to order.

1. WELCOME BY DR. BONNAR

The Speaker: There is among those present a man who for many years was a member of this House of Delegates, but who through the vicissitudes of misfortune, or otherwise, was not returned. We all remember last year this gentleman in the House of Delegates and his extending the invitation to hold this Annual Meeting in Buffalo, and I feel that we can afford to spare a few moments and ask Dr. John D. Bonnar of Buffalo to speak to this House.

Dr. Bonnar of Buffalo thereupon delivered an address of welcome.

2. COMMITTEE ON CREDENTIALS

The Speaker: The first order of business is the report of the Reference Committee on Credentials; Mr. Secretary.

The Secretary: Mr. Speaker and gentlemen, there are no disputed delegations. All gentlemen present have a right to vote.

The Speaker announced that the Secretary would call the roll by Counties for the purpose of determining the presence of recognized delegates.

The Secretary thereupon called the roll by Counties.

The Speaker: There being a quorum present, we will proceed to the business of the House.

3. APPROVAL OF THE MINUTES

The Speaker: The first order of business is the reading of the Minutes of the previous session.

The Secretary: As these Minutes have been published, I move that the reading be dispensed with and that they be adopted as published in the July 1st, 1931, issue of THE NEW YORK STATE JOURNAL OF MEDICINE. Motion seconded and carried.

4. REFERENCE COMMITTEES

The Speaker: I will now ask the Secretary to read the list of reference committees.

The Secretary read the following Reference Committees:

Reference Committee on the Report of the President: Floyd S. Winslow, Chairman, Monroe; Louis A. Van Kleeck, Nassau; Hyzer W. Jones, Oneida; Cornelius J. Egan, Bronx; John A. Hatch, Yates.

Reference Committee on the Reports of the Secretary, the Council and Councilors: Harrison Betts, Chairman, Westchester; Walter T. Dannreuther, New York; William A. Krieger, Dutchess-Putnam; Albert L. Voltz, Queens; Julius Ferber, New York.

Reference Committee on the Reports of the Treasurer and Trustees: Frederick H. Flaherty, Chairman, Onondaga; Edward R. Cuniffe, Bronx; Edwin A. Griffin, Kings; Francis M. O'Gorman, Erie; Franklin Welker, New York.

Reference Committee on the Report of the Committee on Legislation: Walter D. Ludlum, Chairman, Kings; B. Wallace Hamilton, New York; Joseph B. Hulett, Orange; Claude C. Lytle, Ontario; Joseph D. Olin, Jefferson.

Reference Committee on the Report of the Committee on Scientific Work and the Committee on Arrangements: Morris Maslon, Warren; David W. Beard, Schoharie; Sylvester C. Clemans, Fulton; Albert E. Payne, Suffolk.

Reference Committee on the Report of the Committee on Public Health and Medical Education: Reeve B. Howland, Chairman, Chemung; Edgar A. Vander Veer, Albany; James W. Smith, New York; Thomas M. Brennan, Kings; Richard H. Sherwood, Niagara.

Reference Committee on the Report of the Committee on Medical Economics: Terry M. Townsend, Chairman, New York; Horace M. Hicks, Montgomery; Albert A. Gartner, Erie; Samuel J. Kopetzky, New York.

Reference Committee on the Report of the Committee on Public Relations: Luther F. Warren, Chairman, Kings; Andrew Sloan, Oneida; Luther C. Payne, Sullivan; Leon M. Kyser, Steuben; Romeo Roberto, Westchester.

Reference Committee on the Report of the Legal Counsel: Augustus J. Hambrook, Chairman, Rensselaer; Charles C. Trembley, Franklin; Mary J. Kazmierczak, Erie; Carl Boettiger, Queens; Willard H. Veeder, Monroe.

Reference Committee on the Reports of the Committee on Medical Research and the Committee on Periodic Health Examination: DeWitt Stetten, Chairman, New York; C. Knight Deyo, Dutchess-Putnam; Walter A. Calihan, Monroe; Edwin H. Fiske, Kings; Guy S. Carpenter, Tioga.

Reference Committee on the Reports of the Committee to Study the Nurse Problem and the Committee on Physical Therapy: Alec Thomson, Chairman, Kings; Frederick J. Schnell, Niagara; George S. Towne, Saratoga; Reginald A. Higgons, Westchester, Nathan Ratnoff, New York.

Reference Committee on Credentials: Daniel S. Dougherty.

Reference Committee on New Business (A): Edward M. Colie, Jr., Chairman, New York; Aaron Sobel, Dutchess-Putnam; Harry Aranow, Bronx; Lucius H. Smith, Wayne.

Reference Committee on New Business (B): Edward Fiske, Chairman, Kings; Milton G. Potter, Erie; C. Ward Crampton, New York; Adolph De Sanctis, New York; William Klein, Bronx.

Reference Committee on New Business (C): J. Lewis Amster, Chairman, New York; George M. Fisher, Oneida; Frederic E. Elliott, Kings; Earl W. Wilcox, Chenango; Otto H. Leber, New York.

5. ADDRESS OF THE PRESIDENT

The Speaker: The next order of business is the address of the President.

The Secretary: Mr. Speaker, inasmuch as all the Annual reports, together with the President's have been printed and sent to the Delegates and are now in their hands, I move, that they be referred to the respective committees without being read.

Motion seconded and carried.

6 UNFINISHED BUSINESS

The Speaker Is there any unfinished business arising from the previous meeting?

The Secretary None, Mr. Speaker

7 NEW BUSINESS

The Speaker The next order is new business. Has any one a resolution to present?

8 GOVERNORS' COMMITTEE TO INVESTIGATE MEDICAL AND HOSPITAL PROBLEMS UNDER WORKMEN'S COMPENSATION

Dr. Irons of the Bronx The men of the Bronx County Delegation wish to institute a criticism of the Report of the Governors' Committee to Investigate Medical and Hospital Problems under the Workmen's Compensation Law and have instructed me to present the following resolution

1. The majority report of the Committee is adverse to the free choice of physicians

Certain doctors and clinics make a practice of capturing all the compensation work. These doctors and clinics make strenuous efforts to get authorization and are in a position to make their demands for compensation proportionately larger than they would be in the case of the private physician. The family doctor or private doctor, who has not or will not make the extraordinary effort to get authorization is, therefore, at a disadvantage. If free choice were to be denied the patient this recommendation should not be included in any proposed amendment. It can be refuted on the arguments of the report itself. It is plainly evident that the family physician is more concerned about his patient's welfare than any stranger would be.

It discusses and deplores the premature return to work of the injured employee.

This can best be avoided if the family or private physician were to care for those injured claimants. They have a personal interest in the patient and his family. What would the family physician gain by a premature discharge of a patient from his care? The patients treated in compensation clinics receive an impersonal attention and to quote from the report made by Dr. Myers to the State Labor Department on Compensation Clinics

The pervasive mistrust on the part of patients, or physicians in clinics attending them is prejudicial to the patients' morale and speedy recovery.

The Committee deplores the fact that the Department of Labor must rely on the data from the information supplied by the insurance companies. This is a further argument in favor of free choice and the attendance of the patient by his private physician.

2. It ignores the agreement made between the County Societies and the insurance carriers in compensation work which is producing good results and is virtually free choice. This agreement was approved by the Minority Report consisting of two insurance men, Messrs. Brown and Deckelman.

3. It criticizes the doctors generally as being incompetent to treat compensation cases and recommends the formation of a panel of those eligible to do compensation work. The law of this State grants equal rights to all duly licensed and registered physicians. It is known that about ninety per cent of industrial injuries are of a similar nature to those met with in private practice. As for major injuries, these cases being hospitalized are under the care of specialists anyway. The need for complete restoration as possible is the concern of every doctor.

4. It is opposed to lifting and makes certain recommendations for legislation.

We approve of the views and remedies of the majority report on the practice of lifting.

5. It recommends the establishment of state clinics for compensation work. This would be the beginning of a form of state medicine without due consideration and preparation is commented upon by Mr. Ganz in his dissenting report.

6. It condemns the existence of compensation clinics of the insurance companies and speaks of the abuses found by Mr. Meyer's Committee of the ordinary commercial clinics.

We approve of the Majority Report in condemning insurance, industrial and commercial clinics. If it is true that the information obtained from the insurance company clinics is prejudicial to the best interests of the patients, then it holds with equal force for the information about the condition of the claimant which is obtained from the private industrial clinics. Since these private industrial clinics get their whole profit from the treatment of compensation cases and must have the assistance of the insurance companies to do so, it is fair to assume that their interests will lean to the side of the insurance companies that supply them with cases.

7. It speaks of the establishment of a supreme court of medical review. When arbitrators are needed they can always be obtained through the County Societies.

8. It recommends the employment of part time physicians in departmental work. With this provision we are fully in accord and agree with the committee in its reasons therefor.

9. It favors the abolition of authorization for the hospitals. In no part of its report is its onenessidedness so apparent as in this paragraph. The hospitals seem to be protected from any possible inconvenience. Thus the committee recommends the abolition of authorization and gives the hospitals the right of lien, also other features that would obviate interference from any carrier. We fail to see why these same privileges should not be accorded the physician.

We feel that the sending of the C-4 form within a short time protects the interest of the doctor if no such notification has been sent by the employer. In the event that casual relationship has not been established by notifying the insurance company of the occurrence of an accident it protects the doctor by determining whether the casual relationship exists. The sending of the C-4 form prevents the doctor from treating a case for which he will not be compensated.

As to the matter of the inclusion in the compensation law of more occupational diseases and diseases arising out of industry, that should be a subject of study by a larger committee in combination with the State Labor Department.

We feel that the House of Delegates of the Medical Society of the State of New York, through proper channels should communicate with the Governor, and that this report be released to the press after it has been presented to the Governor.

In addition it is recommended that an amendment or ruling be rendered that payment of professional services must be made to that person who actually rendered each service stated in the bill.

It was further recommended that a Bureau be established in accordance with views expressed in the majority report where the question of continuous disability and further treatment be impartially settled.

The Speaker Inasmuch as the better part of the matter contained in this resolution has been covered by the report of the Committee on Medical Economics the speaker will refer this resolution to the Reference Committee which is considering the report of the Committee on Medical Economics (See par. 46).

Is there any further new business to come before the House?

9 STATE CLINICS FOR INJURED WORKMEN

Dr. Elliott of Kings presented the following resolution

WHEREAS Howard S. Cullman, Chairman of a committee appointed by Governor Franklin Roosevelt to review Medical and Hospital problems in connection with Workmen's Compensation Law made a report last February in which appeared a recommendation for the establishment of State Clinics for care of injured workmen; and

WHEREAS in rebuttal to criticism of such recommendation, Mr. Cullman in a written statement published in the *New York Times* Tuesday, May 17th, 1932, page 17, says: "The Committee's plan was formulated by group of physicians and surgeons of unquestioned integrity and ability, after mature study and deliberation," and

WHEREAS, on May 21st of this month, Dr. Adrian V. S. Lambert, Chairman of the Medical Sub-Committee, in a communication to the Economics Committee of this Society, says:

"This plan was proposed by a sub-committee on Departmental Procedure of the General Committee. There was no physician a member of this sub-committee.—The plan was placed in the report by majority vote of the General Committee," and

WHEREAS, on the 20th of this month, Dr. James Alexander Miller, in a communication to the Economics Committee of this Society says—"The majority of the medical members of the Committee, however, thought that the problem should be met in another way, and consequently a supplementary statement was prepared, although not incorporated in the body of the report, as such."

THEREFORE, BE IT RESOLVED that these repudiations of Mr. Cullman's statement be spread upon the minutes of this meeting and that the Secretary be instructed to send a copy of this resolution to the Governor, the Honorable Franklin D. Roosevelt, and that a copy of this resolution be released to the Press.

The Speaker: Referred to Reference Committee on new business.

Is there anything further under the head of new business?

10. ANTIVIVISECTION

Dr. Sondern of New York presented the following resolution:

To the House of Delegates, Medical Society of the State of New York on behalf of the Committee on Medical Research.

During the last session of the Legislature, the antivivisectionists have been so active in New York State as to call for greater exertions in future on the part of those defending animal experimentation. Instead of attempting to refute the claims made for animal experimentation in medical progress as in the past, they adopted the strategy of campaigning in districts in which the outcome of the election has been doubtful; and wherever a candidate was defeated who opposed their cause they claimed that they brought about this defeat. This new method of procedure acted to disturb the minds of the legislators. In both the Senate and the Assembly, they presented bills to prevent all experimentation upon dogs. These bills failed to be reported out of committee.

The National Antivivisection Society has sent to all members of the American Medical Association a questionnaire to obtain individual opinions with regard to animal experimentation and the use of sera. Many of the questions have been artfully devised for advocacy of their cause.

As a result of the agitation as a whole, we have been informed by certain members of the state legislature that they expect help from us during the coming year in convincing the public that their position in opposition to antivivisection legislation is warranted for the public

good. In this your Committee will need the aid of every physician in the state.

It is unnecessary to remind you that insulin was discovered through experiments upon dogs and that the liver treatment of pernicious anemia resulted from experimental observations on these animals; nor need I remark that the clinical methods of taking blood pressure were worked out upon the dog. You know also that the use of iodine in connection with the treatment of goitre resulted from tests made upon dogs living in the goitre belt and manifesting this disease. I need not point out to you that the present methods of chest surgery, of cardiac surgery, of stomach and intestinal surgery and of brain operations were all worked out upon the dog. Many other advances made by the use of this species will suggest themselves to you.

It is important for us to have clearly in mind for the information of the public the reasons why experimentation upon the dog is essential to medical progress and why it is impossible to utilize other species instead, as urged by the antivivisectionists. Some of these reasons may be mentioned here. For many sorts of experiments for the better understanding of disease and its cure, only a large animal can be used. To take but one example, repeated blood tests must often be made over periods of weeks and months, just as in patients. Now what choice have we amongst large animals? We have only the herbivora (sheep, goats, cows, horses) and the dog. It is not practicable to keep considerable numbers of sheep and goats in the laboratory, nor would these be suitable for the work even if this could be done, for they are grass eaters, differing markedly from man in the arrangement of their organs and in their essential physiology and chemistry. The liver treatment for pernicious anemia could never have been discovered by the use of them, for the simple reason that they will not eat liver. The dog will eat anything that man eats, and he is co-operative. One can control his diet and follow the course of his physical disturbances just as if he were a human patient.

There has been a great increase of late in the number of accidental deaths due to electric shock from the ordinary house voltage, as when the individual happens to be wet, as in the bathroom, for example; or has metallic contact with the ground. In many cases death is due to a fibrillation of the heart. A method is urgently needed to restore hearts from such fibrillation. It is essential to use dogs for the experiments since they are the only available animals in which the heart acts like the human heart as concerns recovery from fibrillation. Experiments on the dog's heart have led to much of our recent knowledge of cardiac irregularities and the ways to treat them. In proportion as we doctors prevent more and more people from dying before their time, the problems of the diseases of the aged, notably renal and cardiac diseases, will become more pressing. To obtain a further understanding of these diseases experimentation upon the dog will be necessary.

The antivivisectionists frequently say that medical students can be satisfactorily trained in the practical methods of surgery by the use of the cadaver. Anybody who has ever seized a bleeding artery will know that this is impossible. I wish to stress this point, since the antivivisectionists vigorously attacked the utilization of the dog for teaching purposes. The stomach and intestines of the dog are so nearly like those of man in their size, form and functions that by utilizing them the surgeon is enabled both to obtain his necessary skill and to work out new methods for use on human beings. The immense, grass-distended, sack-like bowels of the herbivora obviously cannot be employed, nor can the small fragile bowels of the cat and rabbit. The dog has a stiff-walled thorax, not a yielding one like those of the smaller laboratory animals. Operative methods must frequently be practiced upon this thorax before they can be attempted in man. So too with operations on the cranium and kidney.

The existing statute against cruelty to animals has been so drawn up that experimenters guilty of cruelty can be successfully prosecuted, as a test case has shown. In this case an experimenter had put adhesive tape loosely about the jaws of a diabetic dog between feeding to prevent the taking of food that might be offered by unauthorized persons. This was held to be cruelty by the judge, and the doctor was convicted. The case shows that the present law can be successfully invoked even for slight cause. It permits scientific experiments and investigations to be performed only under the authority of the faculty of some regularly incorporated medical college, university or laboratory of the state. As a special safeguard for the proper treatment of animals, the laboratory workers themselves voluntarily drew up a code of rules for the conduct of experiments and these rules are not only posted in all laboratories, but also strictly enforced by the directors. I state these facts to make it plain to you that there is no need for further legislation to protect the dog or other animals.

The antivivisectionists make the charge that dogs are employed for research and in teaching when smaller animals would do as well. Practical consideration are all against this. Dogs are expensive animals both to buy and to maintain, and are used only when other animals will not serve the purpose. In fact, it is imperative to use smaller creatures wherever possible, to cut down cost, if for no other reason. But there are also other reasons, very important ones: namely, that the smaller animals, rabbits, rats and mice as raised for the laboratory, have less individuality than dogs and can be utilized in larger numbers, the results being statistically more dependable. For example, cancer is very frequent in old female dogs, as you know, but to transfer the disease to other dogs for experimental purposes would require not only the use of groups of them, but these groups would have to be of precisely the same breed as the individual with the cancer, since otherwise the tumor cells could not be successfully transplanted. Because of these difficulties, to say nothing of the fact that the dog is not essential, workers on the cancer problem utilize cancerous rats and mice, transferring the malignant tissue to other individuals of the same species.

I hope I have made clear not only that experimentation upon the dog is essential to medical progress and to medical teaching, but furthermore, that all necessary legislation to prevent the abuse of animal experimentation has already been provided. The dog is used no more than is necessary, because of the reasons just pointed out.

In response to questionings before legislative committees, the antivivisectionists have repeatedly admitted that the bills they advocate each year to prevent experimentation upon the dog are merely entering wedges for legislation to prevent animal experimentation entirely. But they go much farther than this. At their New York City headquarters they distribute pamphlets warning people against the Pasteur treatments for rabies, asserting that there is no such thing as a mad dog and no such disease as hydrophobia. In other pamphlets they attack vaccines against smallpox and typhoid and the use of diphtheria antitoxin, calling them together with the Pasteur treatment for rabies, the "Four Whited Sepulchres." They also warn the public against any surgery for cancer, suggesting that such surgery is performed by the surgeons only for the purpose of making money. Instead of surgery they suggest a diet of carrots for cancer.

It must be evident to you from these facts that the antivivisectionists strike at the well being of the community in general. However, their immediate menace lies in their efforts to prevent experimentation upon dogs. It is essential that we physicians should combat this attack upon the public safety in the way indicated, and for this purpose on behalf of your Committee on Medical Research I crave your aid.

I will ask, if I may, that the members of this House of Delegates help your committee on Medical Research to obtain as many prominent lay signatures as possible to the following, namely:

"The Medical Society of the State of New York consisting of thirteen thousand physicians pledges proof at any time; that animal experimentations has largely contributed to the fact that the world has been made more healthful and safer not only for the human being but also for the animals themselves. The Society likewise pledges that such necessary experiments are now under complete legal control and are made in the most humane manner possible to serve their purpose. For those reasons I am opposed to any legislation which will restrict animal experimentation and thus hinder medical progress."

If you get me signatures enough to that I believe we can defeat our opponents.

The Speaker: This being a supplementary report of the Committee on Medical Research, it will be referred to the Reference Committee on Medical Research. (Par. 43.)

Is there anything further under the head of new business?

11. DISPENSARY ABUSES

Dr. Frucht of Kings presented the following resolution:

WHEREAS, the economic condition of the Medical Profession, especially in the metropolitan district, is in bad straits, because of dispensary abuses; be it therefore

RESOLVED, that it is the opinion of the Medical Society of the State of New York that all clinics should admit patients free of charge; and be it further

RESOLVED, that no patient should be treated in said dispensary or clinic who can afford to pay for treatment.

The Speaker: Referred to Reference Committee on New Business A. (Action par. 22.)

12. REGULATION OF FREE TREATMENTS IN HOSPITALS

Dr. Kazmierczak of Erie presented the following resolution:

WHEREAS, the Medical Society of the County of Erie has received information that hospitals operating under the general municipal law are receiving not only the indigent sick but also patients on the free or on a part pay basis who are financially able to pay the usual hospital charges and the fees of a private physician, and

WHEREAS, the visiting staffs of such institutions usually are composed of physicians who serve without pay, and

WHEREAS, physicians in the majority of cases are taxpayers and under these conditions not only are giving their services free but actually are being taxed to provide buildings and equipment for patients able to pay for private service, and

WHEREAS, the receiving of such patients by these publicly owned general hospitals makes it necessary at frequent intervals to expand such institutions at the expense of the taxpayers, and

WHEREAS, patients who are able to pay for private treatment have been encouraged by newspaper articles obviously inspired by the authorities of such publicly owned hospitals to seek free or part pay treatment, and

WHEREAS, such newspaper articles have violated the spirit of medical ethics by extolling great cures and even mentioning the names of doctors, therefore, be it

RESOLVED, that the Medical Society of the County of Erie in meeting assembled April 18, 1932, condemns such practices and instructs its delegates to present this resolution at the annual meeting in 1932 of the House of Delegates of the Medical Society of the State of New York together with the request that the House of Delegates instruct its Committee on Legislation to draft and

introduce in the New York Legislature a bill to remedy such abuses, and be it further

RESOLVED, that the Medical Society of the County of Erie circularize the county medical societies of the State with a petition to the effect that no hospital supported wholly or partly at public expense shall admit patients for diagnosis or treatment on the free or part pay basis, if such patients upon investigation is found to be financially able to pay for medical care and necessary hospital charges and that such patients shall be attended by a medical doctor or surgeon of his own choice, except in case of emergency. In case of a minor or one of legal incompetency the patients shall be received and the nearest relative or guardian shall be required to choose a physician for him. The bill to apply to all cases except patients afflicted with tuberculosis, malignancy or insanity.

The Speaker: Referred to Reference Committee on New Business A. (Action, par. 33 and 34.)

Is there anything further under the head of new business?

13. HISTORY OF MEDICINE IN NEW YORK STATE

Dr. Costello of Monroe presented the following resolution:

WHEREAS, the State Medical Societies of several of the states, are preparing and publishing valuable histories of medicine in their respective states, and

WHEREAS, the Medical Society of the State of New York has not undertaken any such publication recently, and

WHEREAS, there exists among the Membership of the Medical Society of the State of New York, men who have often shown a real interest and aptitude to engage in historical study, be it

THEREFORE RESOLVED, that the House of Delegates of the Medical Society of the State of New York, approve the appointment of a Committee to undertake the preparation of a history of medicine in New York State.

The Speaker: Referred to Reference Committee on New Business B. (Action, par. 23.)

Is there anything further under new business? Are there any Reference Committees ready to report?

14. REFERENCE COMMITTEE ON REPORT OF COMMITTEE ON LEGISLATION

(Journal, May 1, page 525)

Dr. Ludlum of Kings presented the following report:

The Legislative Committee offers one recommendation namely that: "Every County Medical Society, Academy of Medicine, and other scientific group should appoint an influential committee whose purpose it shall be to interest and organize the leading citizens of their community for the protection of the public against these senseless fanatics, bigots and quacks who are forever threatening to undo all that has been accomplished in public health, sanitation and hygiene."

Concurring with this and to give it force, the Reference Committee recommends that this recommendation be approved by this House and published *conspicuously* in the State Journal, with proper editorial preamble addressed to all constituent County Societies.

The Reference Committee desires again to express for you and the State Society its appreciation of the laborious and efficient work done by the Legislative Committee and of Dr. Lawrence's cooperation with it.

There being but a single recommendation involved the committee moves the adoption of the report as a whole. Motion seconded and carried.

The Speaker: Are there any other resolutions under the head of new business?

15. REPORT OF COMMITTEE ON THE REPORT OF THE COMMITTEE ON PUBLIC RELATIONS

(Journal, April 15, page 498)

Dr. Warren of Kings presented the following report:

The Committee recognizes the important work that devolves upon the Public Relations Committee of our Society and commends it upon its accomplishment of the past year. These changing and unsettled times demand much more thought and effort of this Steering Committee of Health Contacts—possibly more than any other time in our organization.

One reads through the lines of the report the spirit with which the Committee has approached its relationships problems. It has attempted through conference and discussion to bring harmony and understanding of purpose and action at all times between the parties concerned. It has taken into its conferences knowledge and scientific facts which can never be denied. It has brought reasonableness into the application of this knowledge and these facts and has been able to do what medicine must do, if the health of the people of the State of New York is to be best conserved; it must present leadership of a convincing and knowing character.

The report further shows that these public relations problems approached in such manner are capable of solution.

Your Committee then commends the great amount of work done by this Committee in the past year and approves of the manner and spirit in which this work was accomplished.

16. LECTURES TO MEDICAL STUDENTS

The next part of the report deals with lectures to medical students. These lectures were given to senior medical students with the idea of acquainting them with some of the laws having to do with medical practice. Your committee believes that medical education in the past has not supplied the outgoing senior with the knowledge that he should have possessed concerning, not only the laws but many other public relations under which he practices and with which he daily contacts. He has not then been educated to assume his full responsibility to the public in these matters. He has been almost led to believe that health departments and lay organizations dealing with health matters were his hidden enemies attempting to curtail his profession in any way that they might. This attitude has made him unfit to cope with many community affairs of public health importance.

Your committee believes that education is the strongest weapon we have to acquaint the soon-to-be doctor with the many public relations contacts that he must meet in matters of health activity, and it

RECOMMENDS, that the lectures given to senior medical students in medical schools throughout the State be increased as speedily as possible to cover in a thoroughgoing manner not only those laws pertaining to practice, but other public relations activities in which he should be instructed to have a proper idea of the newer responsibilities that medicine must assume along these lines.

The Committee further knows that some medical schools give instruction in the workings of the Medical Practice Act, medical ethics, and so forth, and it realizes that the medical curriculum is now so full that there should be no duplication of effort. It therefore

RECOMMENDS, that the Committee on Public Relations, through the deans of medical schools, get into contact with individuals in these schools giving this work, with the idea of cooperation in effort, to the end that these public relations problems be thoroughly developed and presented to medical students, without duplication.

I move its adoption.

Motion seconded and carried.

17. COOPERATION WITH OTHER COMMITTEES

Dr. Warren: The report then refers to its cooperative effort with the Committee on Public Health and Medical Education. It recites its efforts in studying with this body the report of the Governor's Special Health Commission, which report was received by the Special Session of the House of Delegates in Albany on January 14, 1932. Your Committee recognizes the splendid effort of the Committee in cooperating with the Public Health Committee in this work, to which we believe every member of this House owes thoughtful appreciation.

The report then passes to a discussion of the Committee's cooperation with the Department of Social Welfare. It tells of rules and regulations which are to be applied to all hospitals of the State and states that it aided in formulating such rules and regulations. As these rules and regulations have apparently been enacted as social welfare laws, the Committee has no recommendations to make upon this section of the report.

The activity of members of the Committee in working with the Greater New York Coordinating Committee is commended, and it is

RECOMMENDED, that the Public Relations Committee of the State Society take great interest and give support to the deliberations of the Greater New York Coordinating Committee, to the end that it adds weight, through state representation, to the efforts of this Committee; and furthermore, because the problems of the Greater New York Coordinating Committee are the same as those of the other Public Relations Committees throughout the state; namely, to bring to bear every effort that is possible for the solution and safe guidance of public relations problems to the ultimate health of the people of the State of New York.

I move its adoption.

Motion seconded and carried.

18. EXAMINATION OF SCHOOL CHILDREN

Dr. Warren: Examination of school children is next taken up by the committee. It states that the pre-school examination of children is a matter in which there is little interest among the practicing profession. Fifteen per cent of these children only are examined by the family doctor. Your committee

RECOMMENDS, that a study be made by this Public Relations Committee in conjunction with the Public Health Committee as to why more children are not examined by the family doctor, and that these committees report the results of their study to the Executive Committee, with recommendations for improvement. It further

RECOMMENDS, that the Executive Committee, after the receipt of this report, if it deems it advisable, acquaint the chairman of each County Public Relations Committee with the results and recommendations of this report, to the end that this matter be brought to the attention of every member of our Society, with the idea of stimulating interest and arousing the physician to the responsibility that he should have in his work.

I move its adoption. Motion seconded.

The Speaker: The motion in favor of adopting this portion of the report has been made and seconded.

The motion carried.

19. REGIONAL CONFERENCES WITH COUNTY CHAIRMEN

Dr. Warren: The report then speaks of regional conferences of the County Public Relations or Public Relations and Health Committees. It records with satisfaction that much interest has been aroused and much good has come from these conferences. Your Committee therefore

RECOMMENDS, that these regional conferences be continued and increased as deemed necessary to have the

County Society acquainted with the efforts of its parent State Society along these lines, or to have County Societies aided in their efforts through the strength and influence of the State Society Committee's help.

I move its adoption.

Motion seconded and carried.

20. PERSONNEL OF COUNTY PUBLIC RELATIONS COMMITTEES

Dr. Warren: In discussing the next part of the report telling of the personnel of County Committees the report strongly urges against the rapid change of personnel on County Public Relations Committees; for in its study and contacts it is found that those counties which have experienced, tried and well qualified persons on this committee are able to handle the important matters of this committee in the most satisfactory way. Some counties have even succeeded in getting all public relationship problems dealing with medical matters referred to the County Society for its deliberation and final recommendations. Your committee believes that these observations and contentions are sound, and therefore

RECOMMENDS, that as little change as possible be made in the personnel of the County Public Relations Committees. It also

RECOMMENDS, that members having a bent or special qualifications for conference and leadership should be placed upon such committees.

The committee further

RECOMMENDS, that every chairman of the County Public Relations Committees attend the regional conferences of the State Committee, so that he may be posted as to the activities of other regional groups and be the better informed of their actions on problems similar to those of his own community.

I move its adoption.

Motion seconded and carried.

21. PHYSICIANS ON LAY PUBLIC HEALTH ORGANIZATIONS

Dr. Warren: The committee agrees with the report that well qualified physicians especially interested in lay problems having a public health bearing should, if taken into the Board of such organizations, spend enough time and thought to be leaders in its activities and to guide such organization into workable programs.

Lastly, the report deals with the cooperation of medicine with all public relations medical activities. It recognizes the difficulties ahead, but it believes that with a spirit of cooperation and understanding all difficulties can be smoothed out and medicine advanced slowly but surely to the leadership of all public health relation problems—which it must assume if the health of the people of the State of New York is best conserved and the practice of medicine is to be maintained as a worthy and progressive profession.

I move the adoption of the Report as a whole.

Motion seconded and carried.

22. DISPENSARY ABUSES

Dr. Colie, Chairman, Committee on New Business A. The resolution of Dr. Simon Frucht of Kings County as redrafted is recommended. (Par. 11.)

"WHEREAS, the economic condition of the Medical Profession, especially in the Metropolitan District, is in bad straits, to which dispensary abuses largely contribute; be it therefore

RESOLVED, that it is the opinion of the Medical Society of the State of New York that all clinics should admit and treat free of charge patients as are indigent; and be it further

RESOLVED, that no patient should be treated in said

dispensary or clinic who can afford to pay for treatment.

I move that the recommendation be adopted.

Motion seconded and carried.

The Speaker: Are there any other committees ready to report?

23. HISTORY OF MEDICINE IN NEW YORK STATE

Dr. Fiske of Kings: "The Reference Committee, on New Business B, after due consideration of the Resolution of the County of Monroe relative to the preservation of the History of Medicine, recommends the adoption of this resolution; and the appointment of a committee to undertake such study. The committee should be instructed to further the preparation of the History of Medicine of the State of New York. (Par. 13.)

"It is further recommended that the said committee avail themselves of the already published History of Medicine in New York State up to about twenty years ago."

I move the adoption of this resolution and the appointment of the committee as named.

Motion seconded and carried.

The Speaker: Are there any other committees ready to report?

24. NEW SCIENTIFIC SECTIONS

The Secretary: Mr. Speaker, I have received applications for the formation of three new sections; a section on radiology, a section on gastroenterology, and a section on plastic and reconstructive surgery. I move these applications be referred to the Council.

Motion seconded and carried.

The Speaker: Is there any other committee ready to report?

25. REVISION OF CONSTITUTION AND BY-LAWS

(Committee report in Journal, May 1, page 531)

Dr. Heyd: May I suggest that in the presentation of the revisions of the Constitution and By-Laws, since there are but few controversial matters, that we adopt the procedure that if there is no objection each individual section be not put to a formal vote. Where an objection is entertained then that section shall be put to a formal vote and at the conclusion a formal vote be taken to ratify the revisions of the Constitution and By-Laws as a whole. I move the adoption of this procedure.

Motion was seconded and carried.

Dr. Heyd: Constitution. Article 1. Name and purposes. Add in the 9th line following the word "medical" "and public health" and also at the end of the paragraph following the word "medicine." In the last line strike out the word "great." The paragraph will then read:

"The name and title of the Society shall be The Medical Society of the State of New York. The purposes of the Society shall be to federate and bring into one compact organization the medical profession of the State of New York; to extend medical knowledge and advance medical science; to elevate the standard of medical education; to secure the enactment and enforcement of just medical and public health laws; to promote friendly intercourse among physicians; to guard and foster the material interests of its members, and to protect them against imposition; and to enlighten and direct public opinion in regard to the problems of medicine and public health."

Articles II, III and IV remain the same. Article V. Officers. In the 7th line following the word "thereof" place a period, striking out the word "and." Also strike out lines 8, 9, 10, 11 and half of 12. The 12th line to be changed to read as follows:

"The Officers shall take office at the termination of the annual meeting at which they were elected with

the exception of the Councilors elected by the District Branches who shall take office at the termination of the next annual meeting of the State Society."

The Speaker: If anyone has any objections to any of the amendments, please record them as they are read, as the time to make them is as each Article and Section is presented.

Dr. Heyd: "Article VI. Trustees. Strike out of the 2nd line the words "elected as such Trustees." Strike out the second paragraph. The Article will then read:

"The Board of Trustees shall consist of five members. The President, the Secretary and the Treasurer shall sit with the Board of Trustees with voice but without vote."

Article VII. Censors. Strike out the first 2 paragraphs and insert the following:

"The Board of Censors shall consist of the President, the Secretary and the eight District Councilors.

"Five Censors shall constitute a quorum.

"The President and the Secretary of the Society shall sit as Chairman and Secretary respectively of the Board of Censors but without vote except that in case of a tie the President, sitting as Chairman of the Board of Censors, shall cast the deciding vote.

"The 3rd paragraph now becomes the 4th paragraph and remains the same."

Dr. Schiff of Clinton: Merely as a point of information in regard to censors, what change, if any, does this amendment affect? Is it merely clarification of the wording?

Dr. Heyd: Most of these revisions are for the purpose of clarity. Where there is a fundamental departure I will indicate the difference.

Article VIII. Meetings. In the 1st line strike out the words "and the Intermediate Stated." In the 2nd line strike out the letter "s" of the word "Meetings" and change the word "or" to the word "and." The paragraph will then read as follows:

"The Annual Meeting of the Society and of the House of Delegates shall be held at the time and place designated by the House of Delegates."

In the 4th line, strike out the last word "The," also strike out the 5th, 6th and 7th lines and insert after the words "House of Delegates," the following:

"When the House of Delegates is not in session the Council shall exercise all the rights and duties of the House of Delegates that are not inconsistent with the Constitution and By-Laws of the Society."

Article IX. Funds. In the 7th line make a new paragraph beginning with the words "No funds of the." In the 11th line strike out the letters "s" in the word "committees" and in the 12th line strike out the letter "s" in the word "members"; in the 12th line following the first word "of" insert the word "any"; in the following word "Committees" strike out the letter "s"; in the 14th line following the word "been" insert the words "recommended by the Executive Committee and." The second paragraph of Article IX will then read as follows:

"No funds of the Society shall be expended for any purpose, except by the authority of a resolution of the Board of Trustees, nor shall any indebtedness be incurred by any officer, committee or member of any committee of the Society as a charge against the Society until the same shall have been recommended by the Executive Committee and approved by the Board of Trustees."

Article X. Referendum. In the 1st line strike out the words "annual or stated"; in the second line strike out the words "Society or of the"; in the 7th line strike out the words "or the Council"; in the 10th line following the word "after" add the word "the" and in the same line following the word "mailing" add the word "of"; in the 12th line following the words "majority of" strike out the rest of the line and also 13th, 14th

and 15th lines Article X will then read as follows with new additional wording at the end

"At any meeting of the House of Delegates a majority of the members present may order a referendum on any question consistent with the Constitution and By-Laws and in accordance with such regulations respecting the submission of the question as the House of Delegates may prescribe. The members shall vote thereon by mail. The poll shall be closed at the expiration of fifteen days after the mailing of the question, and if the members voting shall comprise a majority of all the active members of the Society, a majority of such vote shall determine the question and be binding on the Society and the House of Delegates. The Council may, in a similar manner order a referendum to the House of Delegates."

This is a change and permits for easier referendum by mail than under the old constitution

Article XI District Branches Sec 1 7th line combine "Dutchess-Putnam"

Article XII. County Societies In the 1st line change the word "and" to "or" the balance of the first two paragraphs remaining the same Add as a third paragraph the following

"If there should be an insufficient number of physicians and surgeons in any of the counties of this State to form themselves into a component county medical society, such physicians may become members of the component county medical society of an adjoining county when eligible by the Constitution and By-Laws of such county society."

Article XIII Amendments Second paragraph, 4th line following the word "published" insert the words "at least," in the same line following the word "once" add the words "and at least one month," the paragraph will then read as follows

"Notice of the proposed amendment shall be given at a previous annual meeting of the House of Delegates, and before the same can be acted upon, it shall be published at least once and at least one month before the annual meeting in the official publication of the Society"

Third paragraph, 1st line following the word "the" insert the words "members of the House of" and change the first letter of the following word "delegates" to a capital "D" The paragraph will then read as follows

"A two thirds vote of the members of the House of Delegates present and voting shall be necessary for adoption"

I move you that the revised constitution be adopted by the House of Delegates

Motion seconded and carried

Dr Heyd By Laws Chapter 1 Membership

Sec 1 remains the same Strike out Sec 2 and insert the following

Sec. 2 Any member expelled from his component County Society or suspended from its rights and privileges shall likewise be expelled or suspended for the same period from this Society. The right of appeal to this Society shall not be impaired nor shall such appeal prevent the carrying out of the judgment of the County Society pending such appeal. Members not in good standing or ceasing to be members of their county societies shall ipso facto have the same status in this Society"

Strike out the first sentence including four lines of Sec 3 and insert the following

A member in good standing, in his component county medical society reaching seventy years of age may ipso facto have the privilege of applying for retired membership in the State Society"

The balance of Sec 3 remains the same beginning with All such applications, etc"

In Sec 4, 10th line insert the words "House of" be-

fore the word "delegates" also changing the letter "d" to a capital "D."

Sec 5 remains the same

Chapter II House of Delegates Sec 1 5th line strike out "(d) Trustees" and following the word "and" in this same line change "(e)" to "(d)"

Sec. 2, New Section will read as follows

"Sec 2 A delegate to this Society shall not be considered in good standing or entitled to vote in the House of Delegates if the component county medical society by which he was elected is in default of the payment of any dues or assessments imposed by the House of Delegates, or if such component county medical society shall at the time be under sentence of suspension imposed by the House of Delegates, or if such delegate is not in good standing in this Society, or in the component county medical society to which he belongs. The term of a delegate elected by a county medical society shall begin at the first annual meeting of the House of Delegates subsequent to his election"

Section 2 now becomes Section 3

Insert new Section 4 as follows

"A quorum shall consist of fifty duly elected delegates"

Dr Bedell I would like, sir, to have an explanation on the preceding part where it says "a delegate to this Society shall not be considered in good standing or entitled to vote in the House of Delegates if the component county medical society by which he was elected is in default of the payment of any dues or assessment imposed by the House of Delegates—" I would like information as to what that means

The Speaker Will you answer that, Mr Chairman?

The Secretary I think that can be clarified by striking out the word "any" What your committee meant is, if the component county society is in default of dues or assessments

The Speaker Does that explain the matter to you?

Dr Bedell No, sir, not quite I don't quite understand that If, for instance, my county has a member who has not paid his dues, does that constitute reason for not seating a delegate from that county?

Dr Heyd It only means if the component medical society has not paid the dues, not the individual member

The Secretary If Albany County had not forwarded the dues of Albany County, of course, they are in default Their delegates cannot be seated

Dr Bedell That is just the question I bring before the House. If there is one member in the county society who has not paid his dues that delegate cannot be seated?

The Secretary I don't think that is what it says

Dr Rooney of Albany As a member of the committee I think that it is my duty to explain that it relates to the dues to the state society. It has nothing to do with the relationship of the dues of individual members of that county society to the county society. That, I think, is the intention of the amendment and it seems to me to be quite clear. However, if it does not—is not clear to the society, Dr Dougherty's suggestion of eliminating the word "any" may perfectly well care for any objection that might arise from the House. I do not feel that the word "any" is necessary, but, on the other hand, I want to determine the opinion of the House as a member of the committee. I will move as a substitute the word "any" be deleted from this sub paragraph by the By laws

The Speaker Gentlemen there is a motion on the floor that fifty delegates, constitute a quorum. You have been discussing an entirely different section. Now if the chairman will withdraw that motion we will go back and I will accept the motion of Dr Rooney

Motion relating to number constituting a quorum withdrawn by the chairman

The Speaker The motion fixing the quorum is withdrawn

Now, Dr. Rooney moves that the word "any" be deleted from that portion of the previous section which was read relative to county societies in arrears to the state society.

Motion seconded.

Dr. Sondern of New York: Mr. Speaker, it appears to me from the wording to infer that the county society pays dues to the state society. The county societies pay only the members' dues and, so, it is a little ambiguous, I think, to speak of the county society being in arrears. The county is only in arrears for the dues it has not received from certain members, because the county pays no dues as a society.

The Secretary: Mr. Chairman, the county society, naturally, as Dr. Sondern knows well enough, can be in arrears for assessments. They are not dues, strictly speaking, although assessments are dues when they are an annual assessment. The assessments are collected from the individual members by the county society and forwarded within a specified time to the treasurer of the State Society.

Now, a county society can be in arrears and we have had them in arrears. We have had county societies that have not forwarded their assessments to the State Society and the idea is that such county society is not in good financial standing with the State Society and cannot be represented in its House of Delegates.

The whole matter is more or less—I won't say a quibble, but is rather meticulous. We all know what it means. It merely means that your county must be financially sound with your State Society or you cannot have a representation in this House. Take it any way you please that gives you that understanding and you will strike exactly what the committee means. I also was a member of this committee.

Dr. Schiff of Clinton: It seems to me that this entire phrase "—in default of the payment of any dues or assessments imposed by the House of Delegates—" is unnecessary unless there is some definite provision in the constitution which decides exactly what constitutes a default.

If Dr. Rooney will change his motion to delete the word "any" and delete the entire phrase instead so that it reads "if the component county society by which he was elected shall at any time be under sentence of suspension imposed by the House of Delegates," I think it will clarify the matter.

Dr. Rooney: I accept the amendment.

The Speaker: The reason for this paragraph being inserted is this: there have been instances where every member of a component county society has paid his dues and that money had not been remitted to the State Society by the Treasurer. That is the reason why this clause was inserted.

Dr. Aranow of the Bronx: I move it be referred back for a clearer phrasing.

The Speaker: Do you move it be re-referred to the committee?

Dr. Aranow: Yes.

Motion seconded and carried.

Dr. Heyd: I move you that Section 4 be approved, "a quorum shall consist of fifty duly elected delegates."

Motion seconded and carried.

Dr. Heyd: In renumbered Sections 5, 6, and 7 strike out the word "It" at the beginning of each Section and in each Section insert the words "The House of Delegates."

In Sec. 8 (formerly Sec. 7), No. 8, insert the words "The Board of" following the word "of" making it read as follows:

8. Report of "The Board of Trustees."

Chapter III

Election of Officers

Sec. 1, 1st line strike out the comma following the word "officers" and strike out the word "Trustees" in

the same line. In the 11th line of Sec. 1 strike out the word "Trustees."

Sec. 2, insert New Section as follows:

"The Officers, except the Councilors and Trustees, shall be elected for one year or until their successors have been duly chosen.

"One Trustee shall be elected annually for a period of five years and in the event of a vacancy a Trustee shall be elected for the unexpired term."

Old Sections 2, 3, 4, and 5 remain the same with the exception of renumbering.

Strike out Sec. 6 entirely.

Chapter IV

Council

Sec. 1, strike out lines 3, 4, and 5. In the 2nd line following the word "Delegates" place a period and add the new sentence as follows:

"The members of the Council shall hold office until their successors are duly elected and qualified."

Sec. 2 remains the same.

Strike out old Sec. 3 and insert new Sec. 3 as follows:

"Sec. 3. A quorum shall consist of eleven members."

Sec. 4 and Sec. 5 remain the same.

Sec. 6 strike out entirely.

Sec. 7 now becomes Sec. 6 and reading matter remains the same.

Chapter V

Executive Committee

Sec. 1, in the 4th line following the word "President," insert the words "the President-elect."

Sec. 1, in the 15th line following the word "immediately," strike out the words "and elect a Chairman and a Vice-Chairman" and insert the words "under the Chairmanship of the President of the Society and proceed to elect a Vice-Chairman." Sec. 1 will then read as follows:

"Sec. 1. At its first regular meeting the Council shall choose by a majority vote five members of the Council, three of whom shall be councilors, who together with the President, the President-elect, the Secretary, the Treasurer and the immediate Past President shall constitute the Executive Committee. Candidates for election to the Executive Committee shall be nominated by the President, but other candidates may be nominated by any member of the Council. The Executive Committee shall hold office until the following annual meeting of the Council or until their successors shall be duly chosen. The Executive Committee shall, when elected, organize immediately under the Chairmanship of the President of the Society and proceed to elect a Vice-Chairman. The Executive Committee shall hold regular meetings at times and places that shall be fixed by the Chairman and any two members of the Executive Committee may require the Chairman thereof to call a meeting for such time and place as shall be designated by them in writing, of which the members shall have at least two days' notice. Five members shall constitute a quorum. It shall prepare a budget to be acted upon by the Board of Trustees."

Sec. 2 remains the same.

Sec. 3, in the 3rd line following the word "appoint" insert the words "a Publication Committee." In the 4th line the word "editor" the letter "e" to be changed to a capital letter "E."

Sec. 3, in the 7th line following the word "society" insert the following sentences:

"The Standing and Special Committees of the Society shall report to the Executive Committee and shall be subject to the jurisdiction of the Council or the Executive Committee when the House of Delegates is not in session. No Standing or Special Committee shall inaugurate or initiate any policy or commit the Society

to any policy unless the same has been expressly approved by the House of Delegates, and, or the Council and, or the Executive Committee."

The balance of Sec. 3 remains the same.

Sec. 4, in the 3rd line strike out the word "President" and insert the word "Chairman."

Sec. 5, in the 4th and 5th lines strike out the words "not repugnant to" and insert the words "in conformity with."

Chapter VI

Trustees

Sec. 1, in the 5th line following the word "meetings" insert the sentence "The Board of Trustees shall meet at least bi-monthly."

Sec. 2, in the 3rd line strike out the word "manage" and insert the word "supervise."

Secs. 3, 4, and 5 remain the same.

Chapter VII

Duties of Officers

President

Sec. 1, in the 3rd line following the word "Censors" insert the sentence "He shall be Chairman of the Executive Committee."

At the end of Sec. 1 following the words "the Council shall require" add the sentence:

"He shall not accept any civic or public duties without the advice and consent of the Council."

Sec. 2 remains the same.

President-Elect

Sec. 3, in the 3rd line following the word "Council" strike out the words "but shall attend the meetings of the" and insert the words "and the." In the 4th line strike out the words "without voice or vote."

At the end of Sec. 3 insert the sentence:

"He shall not accept any civic or public duties without the advice and consent of the Council."

Sec. 4 and Sec. 5 remain the same.

Secretary

Sec. 6, 6th line from the bottom strike out the words "The amount of his salary shall be fixed by the Board of Trustees."

Sec. 7 remains the same.

Treasurer

Sec. 8, strike out the last two lines following the word "Trustees": "His salary shall be fixed by the Board of Trustees."

Assistant Treasurer

Sec. 9, 6th line, following the words "shall be elected" insert the words "who, at the expense of the Society, shall give a bond for the faithful performance of his duties, which shall be approved by the Board of Trustees as to the amount, form and surety." The balance of the section remains the same.

Sec. 10 remains the same.

Chapter VIII

Traveling Expenses

Sec. 1, 1st paragraph remains the same. Second paragraph, in the 2nd line, following the word "railroad" insert the words "and Pullman." In the 4th line following the word "President-Elect" insert the words "and all other Officers of the Society." In the 5th line strike out the words "attending committee meetings" and insert the words "engaged upon official business." In the 25th line strike out "of \$250.00" and insert the words

"not to exceed \$200.00." The second paragraph of Chapter VIII will then read as follows:

"The President and the Secretary shall be allowed intrastate railroad and Pullman fares and a per diem for maintenance not to exceed fifteen dollars. The President-Elect, and all other Officers of the Society, shall be allowed traveling expenses when engaged upon official business. The members of the Board of Trustees of the Council, and of the Executive Committee shall be allowed travelling expenses to and from the places of meeting of these respective bodies. In all cases where no appropriation has been allowed a Standing or Special Committee, traveling expenses shall be allowed the individual members of the committee. Proper vouchers must be filed with the Secretary and approved by the Board of Trustees before any such allowance may be made. The Delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return. The vouchers of such expense shall be approved by the Board of Trustees before payment. Each District Branch shall be entitled to receive a sum not to exceed \$200.00, exclusive of the work done by the Secretary regarding notices, programs, etc., to defray the expenses of holding the annual meeting of such District Branch, provided a proper statement of such expense shall have been presented to the Secretary and approved by the Trustees. All bills, claims or vouchers herein provided for shall be filed within thirty days after the date of the incurring of such expense. This time may be extended for any cause by the Board of Trustees and such extension shall not exceed ninety days."

Chapter IX

Censors

Sec. 1 and Sec. 2 remain the same. Sec. 3 remains the same with the addition of the following paragraph which is new matter:

"If the appellant desires to be present in person or by counsel at the hearing of said appeal, the notice of appeal must so state. In that event the appellant must file with the notice of appeal a bond in the sum of \$500.00 to cover the costs of said appeal. If the appellant fails to appear in person or by counsel upon the hearing of said appeal, he shall forfeit to the Medical Society of the State of New York such share of said bond as represents necessary expenditures incident to convening the Board of Censors for the hearing of said appeal."

Sec. 4, Sec. 5, and Sec. 6 remain the same. Sec. 7 remains the same with the addition of the following paragraph which is new matter:

"The appellant must also state if he desires to be present in person or by counsel."

Sec. 8 and Sec. 9 remain the same.

Chapter X

Committees

Sec. 1, 4th line following the words "the Council and" insert the words, "or the Executive Committee and, or." The paragraph will then read as follows:

"Sec. 1. The Committees shall be classified as Standing, Reference and Special Committees, Standing and Special Committees shall report to the Council, and, or the Executive Committee and, or the House of Delegates."

Sec. 1, strike out the 12th line, "Committee on Medical Research."

The committee has heretofore been a Standing Committee—the reason for this is that with the increasing possibilities of antivivisection legislation it may be necessary to create a much larger committee than specified

in the old By-Laws and it may be necessary to enlist as liaison members people who are not members of Medical Societies, such as presidents of colleges, and so forth, and it would be easier for your Executive Committee to handle that particular committee by having it a special committee rather than have it a provision in the By-Laws.

Sec. 2 remains the same.

Sec. 3, 2nd line strike out the word "three" and insert the word "five."

Sec. 3 will then read as follows:

"Sec. 3. The Committee on Legislation shall consist of five members including the Chairman."

Sec. 4, strike out entirely and insert the following:

"Sec. 4. The Committee on Public Health and Medical Education shall consist of nine members including the Chairman. It shall be the function of this Committee to investigate, study and report to the House of Delegates on matters of public health, preventive medicine, and medical education. It shall gather facts regarding the activities of health organizations, both official and non-official, and report to the House of Delegates regarding the same when it so deems necessary. It shall be the duty of this committee to advise the House of Delegates as to plans for post-graduate education for the general profession and shall be in charge of carrying out such plans as are approved by the House of Delegates. It shall cooperate with similar committees of component county societies in carrying out recommendations of the House of Delegates dealing with public health and medical education."

Sec. 5, strike out entirely and insert the following paragraph:

"Sec. 5. The Committee on Medical Economics shall consist of nine members including the Chairman. The function of this committee shall be to conduct investigations, to gather facts, to make studies or surveys on the general subject of the relationship of the physician individually and collectively with the public. It shall receive matters of general public information and study them both in regard to their effect upon the practice of medicine in private or institutional work. It shall concern itself with the financial aspects of the practice of medicine, throughout the State of New York, especially insofar as it affects the efficiency of medical service to the public. It shall concern itself with all economic phases regarding the practice of medicine in hospitals, private or public clinics, commercial organizations and other institutions established for diagnosis and treatment."

Dr. Goodrich of Kings: May I suggest that the number of members of the Committee on Medical Economics be changed from "nine" to "ten." This is for a practical reason. When you have a committee of ten, you can have five sub-committees of two and those sub-committees of two can be constantly working on separate problems from the other members of the committee. We have found that sub-committees of two are of great practical value. I therefore move that the membership of the committee be changed to "ten" members including the Chairman.

Motion was seconded.

Dr. Heyd: I move that Section 5 be approved as amended.

Motion seconded and carried.

Dr. Heyd: In Sec. 6 there is an omission from the report that you are reading. That is, the Committee on Public Relations shall consist of seven members instead of five. In view of the fact that this is before you for the first time, I would like to move that Sec. 6 be approved to read "The Committee on Public Relations shall consist of seven members."

The Secretary: I think it should read seven members including the Chairman.

Dr. Heyd: I move that the Committee on Public Rela-

tions consist of seven members including the Chairman. Motion seconded and carried.

Sec. 7 remains the same.

Sec. 8, strike out entirely.

Sec. 9, 1st line, the word "Chairman" shall be changed to "Chairmen."

Sec. 9 now becomes Sec. 8.

Sec. 10. *Reference Committees*. Strike out entirely and insert the following paragraph, which is now known as Sec. 9.

"Sec. 9. At least one month before the meeting of the House of Delegates the Speaker shall appoint such Reference Committees as he shall deem expedient for the purposes of the meeting. Immediately after the organization of the House of Delegates he shall formally announce the appointments to the committees. Only members of the House of Delegates are eligible for appointment on the Reference Committees. Such committees shall consist of five members, three members constituting a quorum, and shall serve during the meeting at which they are appointed."

Sec. 11, strike out entirely and insert the following paragraph, which is now known as Sec. 10.

"Sec. 10. Reports of Officers and Standing Committees shall be printed at least one month before the meeting of the House of Delegates and sent to the members of the Reference Committee appointed according to Sec. 9, for their preliminary consideration. All recommendations, resolutions, measures and propositions presented to the House of Delegates and which have been duly seconded shall be referred by the Speaker to the appropriate Reference Committee."

Secs. 12, 13, 14, and 15 remain the same with the exception of renumbering.

Chapter XI

Meetings

Sec. 1, 1st line, strike out the word "regular." In the 8th line in the word "Affidavit" change the capital "A" to a small "a."

Sec. 2, 2d line, strike out the word "meeting" and insert the word "or" following the word "annual." In the 2nd line following the word "special" strike out the words "or immediate stated." In the 2nd and 3rd lines change the word "meetings" to the word "meeting." Sec. 2 will then read as follows:

"Sec. 2. Each member in attendance at the annual or special meeting of the Society shall enter his name and the name of the component county medical society to which he belongs in a register to be kept by the Secretary of the Society for that purpose. No member shall take part in any of the proceedings of such meeting until he shall have complied therewith."

Secs. 3, 4, and 5 remain the same.

Sec. 6, 3rd line, following the word "delegates" insert the words "or at request of the Council." Sec. 6 will then read as follows:

"Sec. 6. Special meetings of the House of Delegates shall be called by the Speaker upon the request, in writing, of fifty delegates, or at request of the Council; and in case of the failure, inability or refusal of the Speaker to act, such meetings may be called by a notice thereof subscribed by fifty delegates."

Chapters XII and XIII

remain the same.

Chapter XIV

Component County Societies

Sec. 1 remains the same with the addition of the two following paragraphs, which are new matter:

"When a member in good standing ceases to practice in the State of New York he shall ipso facto cease to be a member of the Society and of his component medi-

cal society. His status shall be deemed that of a resigned member and all rights and title to any share in the privileges and property of the Society, the District Branch, or County Society, shall be deemed to have been forfeited by such action

"The dues of any member of the Medical Society of the State of New York may be remitted for the current year on account of illness when the request is made by the member's component county medical society"

Dr Schiff of Clinton With the privilege of referring to Sec. 1 of this chapter, when a member in good standing ceases to practice in the State of New York he shall ipso facto cease to be a member of the Society," strikes me as not being quite fair. In some places there are some very good members of this Society who may cease to practice although residing still in the State. While I believe primarily this was to cover or intended to cover physicians moving out of the State, I believe in all fairness they should be allowed to continue for the balance of the year for which they paid their dues, allowing them time for readjustment and to become members of some other State society. For that reason I would like to move to refer that Section back to the committee.

Motion seconded and carried

Dr Bedell of Albany May I ask, sir, that Section 3, Chapter 12, be re-referred to the committee. They have made no recommendations or change. The change I would like to suggest—it reads the election of officers of sections shall be the first order of business on the afternoon session of the second day of each Annual Meeting. I suggest it be the first order of business of the morning session. We have to adjourn and then reconvene so as to fulfill the requirements of the By-Laws.

The Speaker I will refer that back.

Dr Heyd Sec. 2 strike out entirely

Sec. 3 now becomes Sec. 2 and remains the same

Sec. 4 and Sec. 5 are combined into one Section and are now known as Sec. 3. In the 13th line of what is now known as Sec. 3 following the words "said society" insert the word "and"

Sec. 3 now reads as follows

"Sec. 3 The Secretary of each component county medical society shall keep a roster of its members and of all other registered physicians of such county in which shall appear the full name of each of said physicians, the date of his admission to such society his residence and the date when his license to practice medicine in this State was granted. He shall note any changes in said roster by reason of removal, death, revocation of license or other disqualification.

He shall forward said roster and information, together with the names and places of residence of each of the officers of said society and the names and residences of each delegate to the House of Delegates of said society to the Secretary of this Society thirty days before the date of its annual meeting"

Sec. 6 and Sec. 7 remain the same with the exception of renumbering

Dr Thomson of Kings Section 3 Chapter XIV, "The Secretary of each component county medical society shall keep a roster of its members and of all other registered physicians of such county in which shall appear the full name of each of said physicians the date of his admission to such society—" does not read very clearly and I doubt very much whether very many county medical societies do keep a roster of all registered physicians. I would suggest it be referred back.

The Speaker I will so order it

Chapter XV

Miscellaneous

Secs 1, 2, 3 and 4 remain the same

Sec. 5 1st line following the word "Officers" insert the word "and," and remove the comma in the first line

following the word "Officers" and in the second line following the word "Society"

Sec. 6 remains the same

Chapter XVI

remains the same *

Chapter XVII

Amendments

Secs 1 and 2 remain the same

Sec. 3, 2nd line, following the word "the" insert the words "House of" and change the letter "d" of the following word "delegates" to a capital "D"

Sec. 3 will now read as follows

Sec. 3 The affirmative vote of two thirds of the House of Delegates present and voting shall be necessary for adoption"

Sec. 4 remains the same

With the exception of those paragraphs that have been referred back for further study I move that the revision of the Constitution and By-Laws be approved by the House of Delegates (1 or action par 35)

Motion seconded and carried

26 REFERENCE COMMITTEE ON THE REPORT OF THE PRESIDENT

(Journal, May 1, page 515)

Dr Winslow of Monroe Dr William D Johnson has devoted the major portion of his time during the past two years to the office of President elect and President of the Medical Society of the State of New York. This committee approves of that portion of the report which states, that the solution of our internal problem has left us free to formulate a constructive policy for ourselves, and to give aid in solving the general problems of health and welfare of a public nature.

I move the adoption of this resolution.

Motion seconded and carried

Dr Winslow This committee calls to the attention of the House of Delegates that portion of the President's report referring to the increase in the provision of the budget for the Committee on Scientific Work.

I move the adoption of this resolution

Motion seconded and carried

Dr Winslow This committee appreciates the gravity of the situation embraced in that part of the President's report referring to the external relations of the Medical Society of the State of New York and this committee recommends that the matter be referred to the Public Relations Committee for further study.

I move its adoption

Motion seconded and carried

Dr Winslow This committee views with commendation the paragraph in the report referring to the valuable work of the chairman of the Legislative Committee, Dr. Aranow, and the Executive Officer, Dr. Lawrence. Both the chairman of the Legislative Committee and the Executive Officer constantly render invaluable service to the membership of this Society, and this committee here by acknowledges the value of these services.

I move its adoption

Motion seconded and carried

Dr Winslow The committee feels that the curtailment and concentration of committee work within the Society is worthy of thought and recommends that this matter be referred to the incoming administration.

I move its adoption

Motion seconded and carried

Dr Winslow Within recent years the pernicious effect of the power of wealth on the ideals of medicine has been a matter of debate within this Society. With constant study and observation it is the hope of this committee that a proper solution of this problem will be achieved.

I move its adoption.

Motion seconded and carried.

Dr. Winslow: The fact that the Committee on Public Relations of the Medical Society of the State of New York has detailed a member of its committee to address the graduating class of each medical college in New York State is evidence of the interest of the medical profession in the welfare and education of the undergraduate medical students, and this committee approves the efforts of this committee in this direction.

I move its adoption.

Motion seconded and carried.

Dr. Winslow: This committee approves the consideration of outstanding medical problems by joint meetings of certain standing committees of this Society.

I move its adoption.

Motion seconded and carried.

Dr. Winslow: This committee recommends that the Medical Society of the State of New York defines the proper limits of the sphere of public health. It furthermore recommends that the treatment of private diseases, and the management of general hospitals, supported by public funds, be supervised by the Medical Society of the State of New York, or its component county societies. This committee again emphasizes the importance of the study of this problem by a joint committee of the Society. The problem of the State aid in general should be referred to the Committees on Public Relations and Medical Economics.

I move its adoption.

Motion seconded and carried.

Dr. Winslow: In summary, this committee recognizes that the efforts and judgment of Dr. William D. Johnson have furnished a distinguished contribution to the welfare of the Medical Society of the State of New York, and therefore, we extend to him a vote of appreciation and gratitude for services rendered to this Society, as President-elect and President.

For holy offices I have a time; a time
To think upon the part of business, which
I bear i' the state; and nature does require
Her times of preservation, which, perforce,
I, her frail son, amongst my brethren mortal,
Must give my 'tendance to.

I move the adoption of the resolution.

Motion seconded and carried.

Dr. Winslow: I move the adoption of this report as a whole.

Motion seconded and carried.

The Speaker: Are there any other committees ready to report?

Report of the Reference Committee on reports of Secretary, Council and Councilors.

27. SECRETARY'S REPORT

(Journal, May 1, page 517)

Dr. Betts of Westchester: Your Reference Committee on the reports of the Secretary, Council and Councilors, reports as follows:

We wish to compliment the Secretary, Dr. Dougherty, on his years of devotion and services rendered to the Society, particularly in these trying times.

We recommend the approval and adoption of his report and the recommendations therein contained, with special reference to the acquisition of an additional room for the Society's offices.

We recommend the adoption of the suggestion by the Secretary that the Special Committee on Periodic Health Examination and the Special Committee on Physical Therapy be abolished and that their work be made a part of that of the Committee on Public Health and Medical Education, and that further consolidation of

other special committees be recommended to the Executive Committee for study and their recommendation.

We recommend that the chairman of the Insurance Committee be authorized to continue his talks before the District Branch meetings.

We recommend that the conferences of the County Secretaries be continued. We commend the work of Dr. Lawrence, our Executive Officer. We feel that he deserves an expression of appreciation on the part of the House of Delegates for his extremely vigilant watch on the legislature, and his tactful handling of many difficult situations.

I move that the report be adopted.

Motion seconded and carried.

28. REPORT OF THE COUNCIL

(Journal, May 1, page 519)

Dr. Betts: We recommend the approval and adoption of the report of the Council as a whole, and wish to especially stress that portion which deals with the publication of the NEW YORK STATE JOURNAL OF MEDICINE. This committee feels that the Journal is of real value to the individual members of the Society. Not only does it keep the medical man in touch with activities in different parts of the State and of adjacent states, but the scientific material published therein deals with medical topics of approved value.

I move its adoption.

Motion seconded and carried.

29. REPORT ON DISTRICT BRANCHES

(Journal, May 1, page 543)

Dr. Betts: We have read with interest the reports of the Presidents of each District Branch, and note the increasing success of efforts in each district. We wish to compliment the respective branches on the excellent programs offered at their annual meetings.

I move its adoption.

Motion seconded and carried.

I move the adoption of the report as a whole.

Motion seconded and carried.

30. INSURANCE RATES

The Speaker: Members of the House of Delegates, I have a rather important announcement to make at this time.

As a result of negotiations which have just been completed by our Indemnity Representative with the Aetna Life Insurance Company, a change has been worked out in our operating agreement with the Company which will permit a decrease in malpractice insurance rates under the Group Plan of the Society.

The rate for the minimum policy will be reduced from \$32 to \$30, with a proportionate reduction in the rates for higher limits. This reduction will apply to both general and x-ray therapy policies, and will become effective on all new and renewal policies dated on or after July 1st of this year.

31. REPORT OF THE LEGAL COUNSEL

(Journal, April 15, page 455)

Dr. Hambrook of Rensselaer: The Reference Committee on the report of the legal counsel begs to submit the following:

We are conscious of the increasing duties that confront the counsel of the State Medical Society and appreciate the necessity of having in that office one who has the interest of the profession at heart and the ability to satisfactorily carry on the work assigned to him. We are especially fortunate in this respect in having as our counsel Mr. Brosnan, who has been intimately associated with the State Medical Society for over ten years. The perplexing problems of preparing a case for trial

and the presentation of the evidence to a lay jury requires unusual ability and an intimate knowledge of the relationship between the medical profession and the public.

The book, *Court and Doctors*, by Lloyd Paul Stryker has received universal approval from the medical profession as well as the members of the Bar. This book is so filled with valuable information that every doctor should procure one. It is especially useful to men who are appearing as expert witnesses in the courts. The committee wishes to thank Mr Stryker for this most valuable addition to our library on the subject of malpractice and legal procedure.

The editorials during the year have been of high standard, very instructive, and are attracting increasing interest on the part of Journal readers. The committee wishes to take this opportunity to thank these authors for their contributions to medical literature and their effort to establish a better understanding of the physician's position in the community and the economic problems confronting the medical profession.

The committee wishes to emphasize that portion of the report dealing with the *Group Plan of Insurance*, more malpractice actions are being instituted each year against members of the profession and it is surprising that any member of the medical profession would leave himself liable and without the protection afforded by some form of insurance. The chairman of the Insurance Committee, Dr John A. Card, has done splendid work, both in his efforts to keep the amount of the premium at a minimum and to educate the members of the Medical Society to the great need of being protected against malpractice actions.

During the year 1931-32, 292 suits were instituted against members of the State Medical Society, of this number 227 were disposed of. It will be noted that although 68 more cases were disposed of this year than last, the number of settlements have remained the same and among these only 3 cases resulted in judgments for the plaintiff and one of these is now up for appeal. Of 11 appeals argued and in which decisions have been rendered in the past year, 10 resulted in judgments for the defendants. Four more appeal cases were argued than during the preceding year. This brief summary indicates the amount of work being done by our legal counsel and the efficient manner in which it is being accomplished.

In conclusion the committee wishes this year again to encourage through its delegates, members of the County Medical Societies to take up the Group Form of Insurance for their own protection. Under the able leadership of our counsel the medical profession can be assured of the best legal advice possible as Mr Brosnan and his associate, Mr Clearwater, are in every way worthy of our confidence.

I move the adoption of this report
Motion was seconded and carried

32 REPORT OF THE COMMITTEES ON SCIENTIFIC WORK AND ARRANGEMENTS

(Journal, May 1, pages 525 and 530)

Dr Maslon of Warren We, the members of this committee have carefully considered the reports submitted by the two committees, and have only words of highest commendation for their efforts.

We feel that the local society should be congratulated upon the arrangements made by them, for the deliberations and entertainment of the members of the House of Delegates and the members of the Medical Society of the State of New York.

We especially commend and congratulate the Committee on Scientific Work for the establishing of the clinics in the local hospitals and the wonderful exhibits presented at this session.

The committee feels that these scientific exhibits arranged by the various local medical organizations and the

New York State Department of Health, such as the syphilis demonstration, the study of the circulation of the kidney in the living animal, the study of cortin, and the other various exhibits, are of such high caliber as to warrant the close study by all the members of this Society.

I move the adoption of the report
Motion seconded and carried

33 HOSPITAL ABUSES (Par 12)

Dr Cole of New York Chairman of the Reference Committee on New Business A. With reference to the resolution presented by the Medical Society of the County of Erie WHEREAS, the Medical Society of the County of Erie has received information that hospitals operating under the general municipal law are receiving not only the indigent sick but also patients on the free or on a part pay basis who are financially able to pay the usual hospital charges and the fees of a private physician, and

WHEREAS, the visiting staffs of such institutions usually are composed of physicians who serve without pay, and

WHEREAS, physicians in the majority of cases are taxpayers and under these conditions not only are giving their services free but actually are being taxed to provide buildings and equipment for patients able to pay for private service, and

WHEREAS, the receiving of such patients by these publicly owned general hospitals makes it necessary at frequent intervals to expand such institutions at the expense of the taxpayers, and

WHEREAS patients who are able to pay for private treatment have been encouraged by newspaper articles obviously inspired by the authorities of such publicly owned hospitals to seek free or part pay treatment, and

WHEREAS, such newspaper articles have violated the spirit of medical ethics by extolling great cures and even mentioning the names of doctors,

THEREFORE BE IT RESOLVED, that the Medical Society of the County of Erie in meeting assembled April 18 1932, condemns such practices and instructs its Delegates to present this resolution at the annual meeting in 1932 of the House of Delegates of the Medical Society of the State of New York together with the request that the House of Delegates instruct its Committee on Legislation to draft and introduce in the New York Legislature a bill to remedy such abuses.

We recommend the adoption of the resolution
Motion seconded and carried

34 STATUS OF PATIENTS PAYING PART OF HOSPITAL COSTS

Dr Cole of New York AND, BE IT FURTHER RESOLVED, that the Medical Society of the County of Erie circularize the county medical societies of the State with a petition to the effect that no hospital supported wholly or partly at public expense shall admit a patient for diagnosis or treatment on the free or part pay basis, if such patient upon investigation is found to be financially able to pay for medical care and necessary hospital charges and that such patient shall be attended by a physician or surgeon of his own choice, except in case of emergency. In case of a minor or one of legal incompetency the patient shall be received and the nearest relative or guardian shall be required to choose a physician for him. The bill to apply to all cases except patients afflicted with tuberculosis malignancy or insanity (Par 12)

We recommend the rejection of this resolution

Motion seconded and carried

Dr Cole I move the adoption of the report as a whole
Motion seconded and carried
On motion duly seconded and carried the meeting thereupon adjourned until 8 p m

Evening Session

The meeting was called to order by the Speaker at 8 P.M.

The Speaker: We will proceed with the business of the House. Are there any resolutions to be offered?

35. STATE FUNDS IN COMPETITION WITH FAMILY PHYSICIAN

Dr. Kopetzky of New York: WHEREAS, the State Fund is a public institution operating under the direction of the Department of Labor; and

WHEREAS, the Woolf Industrial Service is a private corporation practicing medicine in the City of New York; and

WHEREAS, the State Fund has advised its assured in a certain zone in New York to send their injured employees to the Woolf Industrial Service for treatment for such industrial accidents; and

WHEREAS, the fact of a State Institution making arrangements with a private commercial concern for the care of injured workmen and thus taking the treatment of industrial accidents away from the private doctor is inimical to the best interests of the patients and the doctors; therefore,

BE IT RESOLVED: That this House of Delegates of the Medical Society of the State of New York express its disapproval of the action of the State Fund; and be it

FURTHER RESOLVED, that this action on the part of the State Fund, together with a summary of the harm done to the community and the private physicians, and the opinion of this House of Delegates on the matter be forwarded to the Governor of the State of New York, the Commissioner of Labor of the State of New York, and be it

FURTHER RESOLVED, that our Counsel be requested to investigate the legality of such action by the State Fund, and if this action is illegal, then be it still

FURTHER RESOLVED, that the Medical Society of the State of New York take such legal steps as shall be necessary to end this practice.

The Speaker: Referred to Reference Committee on New Business A. (Action par. 47.)

36. HOSPITALS FOR WORLD WAR VETERANS

Dr. Howland of Chemung presented the following resolutions:

WHEREAS, the Federal Government is contemplating the expenditure of large sums of money for the building of additional hospitals to care for veterans of the World War and other ex-service men, and

WHEREAS, civilian hospitals in the United States are filled on an average of not more than 75% of their capacity, and

WHEREAS, economy is essential to an extraordinary degree at the present time, therefore

BE IT RESOLVED, that the Chemung County Medical Society place itself on record as being opposed to the policy of the Federal Government in erecting further hospitals for the care of World War Veterans and other ex-service men until the facilities of the civilian hospitals shall have been exhausted and, further

BE IT RESOLVED, that a copy of this resolution be forwarded to the House of Delegates of the Medical Society of the State of New York and to the House of Delegates of the American Medical Association and, further

BE IT RESOLVED, that a copy of this resolution be forwarded to the United States Senators from New York State and to the Representative in Congress from the 37th District of New York State.

The Speaker: Referred to Reference Committee on New Business B. (Action, par. 53.)

37. CONSTITUTION AND BY-LAWS

Dr. Heyd of New York, Chairman of the Committee on Revision of the Constitution and By-Laws: Mr. Chairman, the Committee on the Revision of the Constitution and By-Laws begs to make the following supplementary report. There were four items referred for reconsideration.

By-Laws Chapter 2, House of Delegates, Section 2. At the end of 6th line, after the words "House of Delegates," there be added "and said County Society has been duly notified of such default."

The section will then read: "A delegate to this Society shall not be considered in good standing or entitled to vote in the House of Delegates if the component county medical society by which he was elected is in default of the payment of any dues or assessments imposed by the House of Delegates, and said county society has been duly notified of such default." The remainder is as printed. I move its adoption.

Motion seconded and carried.

Dr. Heyd: Chapter 2, House of Delegates: That re-numbered section 8 be amended as follows: Subdivision No. 5 be changed to "Report of the President." Subdivision No. 6 be stricken out and in its place be substituted "Address by the President-elect."

I move the adoption of this amendment.

Motion seconded and carried.

Dr. Heyd: Chapter 12, Second 3: The last word "afternoon" be deleted and the word "first" substituted.

The section will then read as follows: "The election of officers of sections shall be the first order of business of the first session of the second day of the Annual Meeting." I move this be adopted.

Motion seconded and carried.

Dr. Heyd: Chapter 14, Section 1: Be amended by adding the words "reside and" after "cease to." The section will then read:

"When a member in good standing ceases to reside and practice in the State of New York he shall ipso facto cease to be a member of this Society and of his component medical society." The point being that the two are inclusive. A man may reside out of the state and still practice, or he may reside in the state and still maintain his membership. If he both moved out and ceased to practice he would ipso facto not be a member of this Society. I move its adoption.

Motion seconded and carried.

Dr. Heyd: Section 3, be amended by deleting all the words after the word "members" third line—"and of all other registered physicians of such county."

Second line from the end of paragraph, after the word "death" add "or change of name."

I move its adoption.

Motion seconded and carried.

38. GOVERNOR'S HEALTH COMMISSION, JOINT COMMITTEE'S REPORT

Dr. Farmer of Onondaga: Your Joint Committee, consisting of the Committee on Public Health and Medical Education and the Committee on Public Relations, was directed by the House of Delegates at its special meeting held in Albany January 14th, 1932, to continue its study of the subject of State Aid. While it is the belief that your direction implies the matter of State Aid as regards Public Health, it is the opinion of the Joint Committee that this study cannot be made without the consideration of State Aid in general.

Your Joint Committee has considered this matter at two meetings, on January 14th, 1932, immediately following the special meeting of the House of Delegates and on March 23rd, 1932, at a meeting of both committees.

Your Joint Committee has not obtained enough necessary information to make any definite recommendations or suggestions on this subject. In view of the changing opinions regarding the question of taxation and appropriation, and the mixed public interest in these subjects at the present time, your Joint Committee believes that more time should be given to this study.

The Speaker Referred to the Reference Committee on the Report of the Committee on Public Health and Medical Education.

Are there any Reference Committees ready to report?

39 NURSE PROBLEM (Journal, May 1, page 541)

Dr Thomson of Kings Your Reference Committee commends the Committee to study the Nurse Problem for its presentation and approves its recommendations regarding the extension of Visiting Nurse Service and also the extension of hourly and appointment nursing in private practice, as well as group nursing.

The Reference Committee approves the recommendation that—This House of Delegates request a complete review of nurse education by the Board of Regents of the State of New York.

The Reference Committee believes that action on the recommendation regarding the training of nurse midwives, trained ward attendants, transfer of basic nurse education, and the establishment of nurse internships be deferred for the present and made a part of that study, and further suggests to the House of Delegates that the State Society offer its services to the State Board of Regents in conducting its review.

I move its adoption.

Motion seconded and carried.

40 COMMITTEE ON PHYSICAL THERAPY (Journal, May 1, page 528)

Dr Thomson of Kings Your Reference Committee heartily approves the whole report of the Committee on Physical Therapy. The efficiency of physical therapy measures in proper cases has been definitely established. The indications for these, and the when and how of their administrations are medical questions and belong to the therapeutic armamentarium of the educated physician.

We recommend that the Committee on Physical Therapy be continued under the able leadership of the present Chairman that further and future teaching of this subject to the doctors be continued as outlined in the Report of this Committee.

The Secretary How can we now pass or adopt a resolution continuing a committee when two or three hours ago we adopted a resolution to the contrary? My recommendation was that the Physical Therapy Committee be continued as a part of the Committee on Education as it was really an educative measure. The Chairman of that committee agreed with me before I put in that report, the Reference Committee recommended it to the House and the House adopted it. My recommendation was not to abolish that committee as a whole but merely to put its work under the educative head.

The Speaker I will refer this report back to the Committee for further report. (Par 54)

41 REPORT OF THE TRUSTEES (Journal, May 1, page 524)

Dr Flaherty of Onondaga The Report of the Trustees was approved by your committee. The committee especially commend the following portion of the report.

"It is earnestly recommended to the House and through it to the Council and the Executive Committee that in all of its proposals involving the expenditure of funds for the ensuing year most careful consideration be given to an appraisal of the value to be obtained by the proposed measure against the actual possible expenditure for carrying it into effect. It seems to the

Board that the present time is one to consider the expenditure of funds for the most urgent purposes only and for the most careful conservation of invested monies."

We commend the Board of Trustees in their good judgment in the investment of the funds of the Medical Society of the State of New York. The report shows a remarkable valuation of the invested funds in consideration of the large depreciation of funds in general. I move the adoption of the report.

Motion seconded and carried.

42 REPORT OF THE TREASURER (Journal, May 1, page 522)

Dr Flaherty of Onondaga The Treasurer's Report was carefully examined by your Committee studying in detail that portion of the report which deals with the cost of the Journal and the Directory. After this careful study, the report was unanimously approved.

I move its adoption.

Motion seconded and carried.

43 MEDICAL RESEARCH (Journal, May 1, page 526)

Dr Stetten of New York Your Reference Committee on the Report of the Committee on Medical Research, has studied the Report and heartily endorses the earnest efforts of the Committee in combating antivivisection legislation, and congratulates the Committee on the successful outcome of these efforts.

Your Reference Committee recommends that the Report be approved.

Your Reference Committee has also studied the Supplementary Report and Pledge in connection with the vivisection problem presented before the House of Delegates at this afternoon's session by Dr Frederic E. Sondern. It also endorses both of these most heartily, and recommends their approval.

I move its adoption.

Motion seconded and carried.

44 PERIODIC HEALTH EXAMINATION (Journal, May 1, page 536)

Dr Flaherty of Onondaga Your Reference Committee on the Report of the Committee on Periodic Health Examination has carefully studied the Report and desires to express its commendation of the splendid work done by this committee in bringing to the attention of the public and the profession the great importance of periodic health examination. It particularly wishes to congratulate the Committee on the enormous amount of work it has done in this direction through its collaboration with the various National lay organizations, and through its extensive radio broadcasting program.

Your Reference Committee recommends that the Report as a whole be approved.

Your Reference Committee further recommends as recommended in the Report, that the House of Delegates pass a resolution to be spread upon its minutes, expressing its appreciation of the great public service that has been rendered by the Columbia Broadcasting Company, its President, William S. Paley, its First Vice-President, Edward Klauber, and its Director of Program Operations, Julius Seebach, and that copies of this resolution be transmitted to the above mentioned company and individuals.

Your Reference Committee further recommends that similar action be taken in respect to the Secretary of the Department of Commerce Ray Lynn Wilbur, and President of the National Radio Homemakers' Club, Mrs. Ida Bailey Allen, both of whom contributed largely to the success of this program.

Your Reference Committee further recommends the approval of the majority recommendation of the Com-

mittee on Periodic Health Examination; that the Committee on Periodic Health Examination be discontinued, and that its function be distributed as outlined in the Report to the three following standing Committees: The Committee on Press Publicity, the Committee on Public Relations, and the Committee on Public Health and Medical Education.

I move the adoption of this report.

Motion seconded and carried.

Dr. Flaherty: In connection with this last report, I have three resolutions prepared which I will present with the approval of the House.

The Speaker: Proceed.

Dr. Flaherty: WHEREAS, the Columbia Broadcasting Company, its President, William S. Paley; its First Vice-President, Edward Klauber, and its Director of Program Operation, Julius Seebach, have rendered a great public service in graciously donating their time and facilities to make possible the broadcast of the radio program of the Committee on Periodic Health Examination of the Medical Society of the State of New York.

BE IT RESOLVED, that the House of Delegates of the Medical Society of the State of New York express its sincere appreciation of this generous gift; that this resolution be spread upon its minutes, and that a copy thereof be transmitted to the Columbia Broadcasting Company and its above-mentioned officers.

I move its adoption.

Motion seconded and carried.

Dr. Flaherty: WHEREAS, the Secretary of the Department of Commerce, Ray Lyman Wilbur, generously cooperated in establishing the radio program of the Committee on Periodic Health Examination of the Medical Society of the State of New York;

BE IT RESOLVED, that the House of Delegates of the Medical Society of the State of New York express its sincere appreciation of his generous cooperation; that this resolution be spread upon its minutes, and that a copy thereof be transmitted to Dr. Wilbur.

I move its adoption.

Motion seconded.

Dr. Rooney of Albany: I would like to know just exactly in what way this contribution of the latter named gentleman was made. I have heard many of his talks over the radio and I have seen much of his printed comment. I am wondering just how much of all of that I have heard is helping the profession of organized medicine in these United States. I am seriously doubtful about its help in relation to what I have heard, and I raise the question as to whether or not any action by this House would not be in effect a ratification of many of the things that have been said by this gentleman that are not beneficial to medicine, in my opinion. I move as a substitute in order to excite discussion that this resolution proposed by the committee be laid on the table.

Motion seconded.

A vote was thereupon taken and the Speaker declared the motion to be lost.

Dr. Crampton of New York: Mr. Speaker, in order to clarify the situation, may I rise first to a point of information? May I ask that the resolution be read?

The Speaker: The resolution will be re-read.

Dr. Flaherty: WHEREAS, the Secretary of the Department of Commerce, Ray Lyman Wilbur, generously cooperated in establishing the radio program of the Committee on Periodic Health Examination of the Medical Society of the State of New York;

BE IT RESOLVED, that the House of Delegates of the Medical Society of the State of New York express its sincere appreciation of his generous cooperation, that this resolution be spread upon its minutes, and that a copy thereof be transmitted to Dr. Wilbur.

Dr. Crampton: It is clear that the recommendation of the House of Delegates is asked not for the person of the Secretary of the Department, nor for any

of his acts or any of his words, but only for the cooperation that his department has given to the work of the committee of this organization as authorized by this House of Delegates and carried out in accordance with its instructions. It is a courtesy which the committee recommended should be extended to a public official who, however deleterious his acts may have been or his words may have been in other particulars, yet his department did a fine, understanding, generous and co-operative thing in helping through these extended periods of public instruction which were undertaken by the Medical Society of the State of New York and carried through and which you have been good enough now to commend. I move the resolution be adopted.

Motion seconded and carried.

Dr. Flaherty: WHEREAS, Mrs. Ida Bailey Allen, President of the National Radio Homemakers' Club, graciously placed her studio and facilities at the disposal of the Committee on Periodic Health Examination of the Medical Society of the State of New York, for the broadcasting of its radio program;

BE IT RESOLVED, that the House of Delegates of the Medical Society of the State of New York express its sincere appreciation of her courtesy and aid in this work; that this resolution be spread upon its minutes, and that a copy thereof be transmitted to Mrs. Allen.

I move the adoption of this resolution.

Motion seconded and carried.

45. PRESS PUBLICITY

(Journal, May 1, page 527)

The Speaker: I will ask Reference Committee on New Business A to consider the report of the Press Publicity Committee as printed in the report of committees and make a subsequent report. (Par. 52.)

46. PRIZE ESSAY

The Speaker: Mr. Secretary, you have a communication from the Committee on Prize Essays.

The Secretary: "The Committee on Prize Essays of the Medical Society of the State of New York begs leave to report as follows:

"During the year we have answered numerous inquiries regarding prize essays but this correspondence resulted in only one paper being submitted. It was the unanimous consensus of opinion that this essay was not of sufficient merit to allow its being considered for the prize."

Referred to Committee on New Business A. (Action, Par. 51.)

47. STATE FUND IN COMPETITION WITH FAMILY PHYSICIAN

(Par. 35)

Dr. Colic of New York: Reference Committee on New Business A.

WHEREAS, the State Fund is a public institution operating under the direction of the Department of Labor; and

WHEREAS, the Woolf Industrial Service is a private corporation practicing medicine in the City of New York; and

WHEREAS, the State Fund has advised its assured in a certain zone in New York to send their injured employees to the Woolf Industrial Service for treatment for such industrial accidents; and

WHEREAS, the fact of a State Institution making arrangements with a private commercial concern for the care of injured workmen and thus taking the treatment of industrial accidents away from the private doctor is inimical to the best interests of the patients and the doctors; therefore

BE IT RESOLVED, that this House of Delegates of the

Medical Society of the State of New York express its disapproval of the action of the State Fund, and be it

FURTHER RESOLVED, that this action on the part of the State Fund, together with a summary of the harm done to the community and the private physicians, and the opinion of this House of Delegates on the matter be forwarded to the Governor of the State of New York, the Commissioner of Labor of the State of New York, and also to the public press, and be it

FURTHER RESOLVED, that our Council be requested to investigate the legality of such action by the State Fund, and if this action is illegal, then be it still

FURTHER RESOLVED that the Medical Society of the State of New York take such legal steps as are necessary to end this practice

We recommend the adoption of this resolution

Motion seconded and carried

48 GOVERNOR'S COMMITTEE TO INVESTIGATE MEDICAL AND HOSPITAL PROBLEMS UNDER WORKMAN'S COMPENSATION ACT

(Par 8)

Dr Townsend of New York Your Committee on Reference on the Committee on Medical Economics has had referred to it the Resolutions presented by Dr Aronow of the Bronx (Par 8) Inasmuch as the contents of this resolution are all contained in the report of the Committee on Medical Economics we feel that no further action is necessary by this House of Delegates than that which they may take on your Reference Committee's report

I move you, sir, the adoption of this Reference Committee's report

Motion was seconded and carried

49 STATE CLINICS FOR INJURED WORKMEN

(Pars 9 and 60)

Dr Townsend The second portion of the Reference Committee's report is on the resolutions as presented by Dr Elliott (Par 9) Mr Speaker, is it necessary to read these resolutions?

The Speaker What is the pleasure of the House?

The Speaker There seems to be a division of the House. Kindly read the resolutions

Dr Townsend WHEREAS, Howard S Cullman Chairman of a committee appointed by Governor Franklin Roosevelt to review Medical and Hospital problems in connection with Workmen's Compensation Law made a report last February in which appeared a recommendation for the establishment of State Clinics for care of injured workmen, and

WHEREAS in rebuttal to criticism of such recommendation Mr Cullman in a written statement published in the *New York Times* Tuesday, May 17, 1932, page 17, says "The committee's plan was formulated by group of physicians and surgeons of unquestioned integrity and ability, after mature study and deliberation," and

WHEREAS on May 21st of this month, Dr Adrian V S Lambert Chairman of the Medical Sub Committee, in a communication to the Economics Committee of this Society, says

"This plan was proposed by a sub committee on Departmental Procedure of the General Committee. There was no physician a member of this sub committee. The plan was placed in the report by majority vote of the General Committee," and

WHEREAS on the 20th of this month, Dr James Alexander Miller in a communication to the Economics Committee of this Society says "The majority of the medical members of the committee however, thought that the problem should be met in another way, and consequently a supplementary statement—was prepared—

although not incorporated in the body of the report, as such"

THEREFORE BE IT RESOLVED, that these repudiations of Mr Cullman's statement be spread upon the minutes of this meeting and that the Secretary be instructed to send a copy of this resolution to the Governor, the Honorable Franklin D Roosevelt, and that a copy of this resolution be released to the Press

Your committee moves the adoption of these resolutions

Motion seconded

Dr Rooney of Albany I feel that we would make ourselves ridiculous by saying the medical members of this committee repudiated Mr Cullman's statement I think that the proper course for us to take is to—so to speak—repudiate the repudiators I move you, as a substitute, sir, that the Medical Society of the State of New York declare that the position taken in the Governor's report in relation to the establishment of State aided clinics for the administration of the Workmen's Compensation Law and their denial of the right of free choice of physicians is not the opinion of organized medicine in this state as announced repeatedly by their representatives, this House of Delegates

Motion seconded

Dr Schiff of Clinton It seems to me that this is too important a matter for the House of Delegates to decide like that It would be a much wiser procedure to refer this back to this committee Personally I approve Dr Rooney's attitude It is up to this House of Delegates to state the position of the Medical Society and to accept at its face value unless more definite proof can be given by the mention of names For that reason I make a motion that the resolution be referred back to the committee and that they will give us a better resolution when it is brought back on the floor

Motion seconded

The Speaker A motion is made and seconded it be referred back to the committee for further consideration

Motion was carried

50 COMMITTEE ON MEDICAL ECONOMICS

(Journal, April 15, page 474)

Dr Townsend of New York Your Reference Committee has studied the voluminous report of the Committee on Economics It has received opinions and suggestions from members of this house, and has conferred with Drs Goodrich and Elliott of the Committee on Economics

At the outset your Reference Committee desires to register its admiration of the breadth of the study made and of the far reaching implications contained therein, and we congratulate the committee in this house on the activity, alertness and breadth of view of the committee There is so much in the Report that it would obviously be impossible to discuss it in detail, to enumerate the factors behind each proposition and paragraph, for your Reference Committee has gone into the details of each paragraph In order to facilitate action for this house we should present the resolutions of our deliberations in the numerical sequence in which the report appears in the printed Annual Reports of this house for 1932, in detail as follows

Your Reference Committee approves the adoption of paragraphs 14A and 14B (Journal, page 475)

I move their adoption

Motion seconded and carried

Dr Townsend Your Reference Committee does not approve paragraph 14C, believing such consideration unnecessary We recommend that the matter contained in paragraph C be referred back to the Committee on Economics for further study

I move the adoption of that section

Motion seconded and carried

Dr. Townsend: We recommend that the matter in paragraph 14D be referred back to the Committee on Economics for further study.

In referring matters back to the Committee on Economics, your Reference Committee does so without opinion and without prejudice, leaving the matter entirely as if it had not been presented. This is necessary because the problems in themselves are interesting and not enough work has been done upon them to produce tangible results; and your committee hopes that the house, in order to concentrate upon paragraphs which can be acted upon, will likewise refer such paragraphs as we recommend to recommit, and that the house do so without prejudice.

(Journal, page 476)

In regard to paragraph 21A the Reference Committee recommends that the recommendation of the Committee on Economics be disapproved, and recommends that the Committee on Economics be authorized to make contacts with the Committees on Economics of the different societies—to obtain the information they desire.

I move the approval.

Motion seconded and carried.

Dr. Townsend: The Reference Committee recommends the adoption of the matter contained in paragraph 21B, provided the cost of such study be kept within the budgeting limit of the Committee on Economics, and that it make a report to the house of paragraphs, when it is finished.

I move the adoption.

Motion seconded and carried.

Dr. Townsend: The committee approves the matter contained in paragraph 21C with the addition—that said publication shall be with the approval of the Editor of the State Journal.

Dr. Rooney of Albany: I wonder just what that means. Does it mean this: if the Committee on Economics submits several articles for publication that it gives the right to the Editor of the Journal to refuse publication? I feel that would probably be an unwise course. I think it should have further study and some safeguards be placed about it. I move you that that portion relating to publication be re-referred to the Reference Committee.

The Speaker: I did not hear any second to Dr. Rooney's motion to re-refer.

The question now before the house is the adoption of the report of the Reference Committee.

The motion for the adoption of the report of the Reference Committee was seconded and carried.

Dr. Townsend: Paragraphs 22-23-25. Your Reference Committee approves the matter contained in Paragraph 22 and Paragraph 23; and in regard to Paragraph 25, your committee disapproves of the paragraph as written and recommends the following substitute: "Therefore, at least a substantial per cent of all Boards of Administration should be physicians representing if possible all of the types of medical service carried on in the institutions."

I move the adoption.

Motion seconded and carried.

Dr. Townsend: 26. The Reference Committee recommends that paragraphs 26, 27, 29, 30, 31, and 32 be referred back to the Committee on Economics for further study.

I move the adoption.

Motion seconded and carried.

Dr. Townsend: 33B and C. We recommend recommitment of paragraphs 33B and C to the committee for further study.

I move the adoption.

Motion seconded and carried.

Dr. Townsend: We recommend that paragraph 33D be approved by this house.

I move the adoption.

Motion seconded and carried.

Dr. Townsend: In regard to the suggestions in paragraph 45, your Reference Committee recommends that paragraphs 34, 37, 38, 39, 40, and 41 be referred back to the Committee on Economics for further study. (Jour., page 477.)

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your committee approves the recommendation in paragraph 45B.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your committee approves the recommendation in 45C with the addition, "That the joint consideration shall include the Committee on Nursing."

I move the adoption.

Motion seconded and carried.

Dr. Townsend: The Reference Committee approves the recommendation contained in paragraph 45D.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 56A. The Reference Committee recommends approval of the principle stated in paragraphs 46, 47 and 48. It disapproves the material contained in paragraphs 51 and 52.

I move the adoption of that portion of the report.

Motion seconded and carried.

Dr. Townsend: 56B. Your Reference Committee approves the material contained in paragraphs 49, 50, 53, 54, and 55.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 56C. Your committee approves material contained in paragraphs 46, 47, and 48; and recommends the recommitment of paragraph 49.

Your committee disapproves the material contained in paragraphs 50, 51, and 52, and recommends that it be not adopted.

I move the adoption of the report.

Motion seconded and carried.

Dr. Townsend: In regard to the suggestion in 61A, your Reference Committee approves the material presented in paragraphs 58, 59, and 60. It also approves the material contained in paragraph 61B.

I move the adoption of the report.

Motion seconded and carried.

Dr. Townsend: In regard to the suggestions in paragraph 75, we recommend the approval of material in paragraph 68, with the following amendment: "Where work of this kind is distributed under reasonable skilled supervision, it is liable to achieve an excellence not obtainable under average medical community facilities. Such a service as this is perfectly capable of being adequately controlled by being confined to the actual demands of industry. We believe that the laws of the traditional professional relationship between the patient and physician which naturally would follow and the exploitation of the physician to his economic social and scientific limitation are to be deplored."

We recommend the approval of the material contained in paragraph 69 with the deletion of all matter after the word—"unavailable."

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your Reference Committee recommends the approval of the matter contained in 81A provided it can be done within the budgetary limit of the money allowed to the Committee on Economics.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your committee approves the matter contained in paragraph 81B with the same provision.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your committee approves paragraphs 81C and D.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your Reference Committee recommends the recommitment of paragraph 81E to the Committee on Economics.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your Reference Committee disapproves the recommendations contained in paragraph 81F.

I move the adoption.

Motion seconded and carried.

Dr. Townsend: Your committee recommends recommitment of paragraph 81G to the Committee on Economics.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your Reference Committee approves the adoption of the recommendation in paragraph 81H.

I so move.

Motion seconded and carried.

Dr. Townsend: Your committee approves the adoption of the matter contained in paragraphs 90A, B, and C.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: Your committee approves the adoption of 90D, with the addition—after the words “to solicit”—“any person or any circular.” Thus amended, we approve 90D.

I move the adoption.

Motion seconded and carried.

Dr. Townsend: Your Reference Committee approves the adoption of material in paragraphs 90E, F, G, H, I, J, K, L, M, and N.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 97A, B, C, D, and E. Your committee recommends the adoption of the matter contained in these paragraphs.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 104A and B. Your committee recommends the adoption of the matter contained in these paragraphs.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 104C. We recommend the adoption of the material in this paragraph, provided the study can be made within the budgetary limit of the Committee on Economics.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 104D. We recommend the approval of the material contained in this paragraph.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 104E. We recommend adoption of the material of this paragraph be contingent upon the reception of an interpretation from the proper authorities as contained in D.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 104F. Your committee recommends approval of the matter contained in that paragraph provided action asked for under Section D is lost.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 115. We recommend that all matters contained in paragraphs 112, 113, 114, 116, and 117 be resubmitted to the Committee on Medical Economics that it may resubmit its recommendations to the Executive Committee after further study.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 119. We recommend approval of the matter contained in this paragraph.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 121. Your committee approves the matter contained in this paragraph.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 125. We recommend the matters contained in sub-sections A, B, C, D, and E be approved except as to paragraph 122. Your Reference Committee recommends adoption of the substitute and that the last paragraph read as follows: “In that vast majority of families where there is a limit of ability to compensate professional service if there has been a bona fide participating service and responsibility, then with the knowledge of the patient, the lump sum which is possible should be divided between the participants according to the respective bona fide service rendered by each.”

I move the adoption.

Motion seconded and carried.

Dr. Townsend: 140. Your Reference Committee disapproves the adoption of the matter contained in 140A.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 140B. Your Reference Committee approves the matter contained in this paragraph.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 140C. Your Reference Committee approves the matter contained in this paragraph with the deletion of all in that paragraph after the word “program.”

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 140D. Your Reference Committee recommends the following substitute for 140D—“That it is the opinion of organized medicine that a socialized and paternalized sick care conducted by political groups without regard to medical opinion is to be deprecated.”

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 148. Your Reference Committee recommends the re-submission of this material to the Executive Committee for consideration in view of additional information in the hands of the committee, which they desire to submit to the Executive Committee for its consideration.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 149. Your committee recommends the adoption of the material contained in special paragraphs A, B, C, D, and E.

I move the adoption.

Motion seconded.

Mr. Brosnan: Before these resolutions are put to a vote I would like the privilege of the floor.

The Speaker: Granted.

Mr. Brosnan: Mr. Speaker and gentlemen of the House of Delegates. Section 149, paragraph A of this report approves the principle of compulsory arbitration in automobile accident cases. This approval is based upon a recommendation by Judge Crane of the Court of Appeals that it would be a desirable thing for the congested calendars to have automobile accident cases decided by a board of arbitration. I desire to point out, however, that if the lawyers who are now handling automobile accident cases on behalf of the plaintiffs are deprived of this business by legislation, they will necessarily invade the field of malpractice on the plaintiffs' side. This, I think, should be taken into consideration in determining whether this recommendation of the Medical Economics Committee should be approved.

As to paragraph D of the same Section, I understand that the permanent committee appointed by the Appellate Division of the Second Department, referred to in said paragraph, has definitely taken the position that it will not appoint any lay person to this committee. It has definitely gone on record as stating that they will not appoint any lay person or lay body on that committee, nor will it permit such persons to participate in oral discussions.

The motion for the approval of paragraphs A, B, C,

D, and E of paragraph 149 was lost.

Dr. Townsend: 149F. Your committee recommends recommitment to the Committee on Economics.

I move its adoption.

The Speaker: I do not understand that myself. Will you please repeat it.

Dr. Townsend: We recommend that it be recommitted to the Committee on Economics for further consideration.

Motion seconded and carried.

Dr. Townsend: 154A. Your Reference Committee disapproves the adoption of the recommendation as printed, and recommends a substitute as follows: "In order to establish respect for the law of the State by all such corporations and to secure an authoritative decision which shall be sufficient to stop injustice to the people of the State and their physicians, the Medical Society of the State of New York, through its counsel, furnish the Department of Education evidence that might lead to the prosecution of some corporation that is practising medicine."

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 154B. Your Reference Committee approves the matter contained in this paragraph.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 158. Your Reference Committee approves the matter contained in this paragraph.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 161A and B. Your Reference Committee disapproves the matter contained in these two paragraphs, and offers the following substitution for adoption: "That the council be instructed to prepare for publication not later than December 15th, 1932, a program of action by the committees of the Society to further cooperation and co-ordination of activity; and to make the collective thought of the State Society effective and powerful; and to encourage the work of its committees, the said council shall bring the budgetary requirements of these committees to the attention of the Executive Committee."

I move its adoption.

Motion seconded and carried.

Dr. Townsend: 162. This paragraph embraces basic principles, and your Reference Committee agrees with every word stated in those principles. Your Reference Committee, on the other hand, feels that even these words limit what should be limitless. The length and breadth, height and distance of organized medicine and its idealism cannot be measured in words; and we therefore recommend that no such set of principles be written, and disapprove the adoption of such.

I move its adoption.

Motion seconded and carried.

Dr. Townsend: I move the acceptance of this report as a whole.

Motion seconded and carried.

51. PRIZE ESSAYS

(Par. 46)

The Speaker: Are there any more committees to come before the house?

Dr. Colie, Chairman of Reference Committee on New Business A: There was referred to this Committee a report of the Committee on Prize Essays:

WHEREAS, the Committee on Prize Essays of the Medical Society of the State of New York begs leave to report as follows:

That during the year we have answered numerous inquiries regarding prize essays, but this correspondence resulted in only one paper being submitted. It is the unanimous consensus of opinion that this essay was not of sufficient merit to allow it being considered for the prizes.

BE IT THEREFORE RESOLVED, that for the current term no award be made.

I move its adoption.

Motion seconded and carried.

52. PRESS PUBLICITY

(Journal, May 1, page 527)

Dr. Colie: There was referred to the Committee on New Business A, the report of the Committee on Press Publicity with certain recommendations. The first recommendation was that the Press Publicity Committee be continued as a Special Committee.

It is recommended that this recommendation be adopted.

Motion seconded and carried.

The second recommendation was that all publicity emanating from officers, committees, and officials of the Medical Society of the State of New York, with the exception of the publicity work of the Committee on Legislation and of the Executive Officer, go through the hands of the Press Public Committee.

It is recommended that this recommendation be rejected.

Dr. Rooney of Albany: I move to substitute for the resolution of the Reference Committee this resolution: "It is recommended that all publicity emanating from officers, committees and officials of the Medical Society of the State of New York which has been approved for publication by the Executive Committee with the exception of the publicity work of the Committee on Legislation and of the Executive Officer, shall be released to the desired agencies for publication only through the Press Publicity Committee."

That, gentlemen, provides for censorship. It follows the steady policy of this House by maintaining supervision of all its activities. It provides for the proper coordination of our desired efforts to inform the public intelligently upon our concerns and theirs, a "Utopian task," but it does not under any circumstances provide for any question of censorship which apparently has been to a degree in the minds of the House.

I move you my motion.

The Secretary: I second Dr. Rooney's motion.

The Speaker: You are voting on the substitute motion of Dr. Rooney.

Motion carried.

Dr. Colie: The third recommendation is that the Trustees be requested to make budgetary provision for the secretarial and other necessary expenses of the Press Publicity Committee. Your Reference Committee recommends this be referred to the Council.

The motion was seconded and carried.

53. HOSPITALS FOR WORLD WAR VETERANS

Dr. Fiske: Your Reference Committee on New Business B has considered the resolution of the Chemung Medical Society which reads: "Be it resolved that the Chemung Medical Society place itself on record as being opposed to the policy of the Federal Government in erecting further hospitals for the care of the World War Veterans and other ex-service men until the facilities of the civilian hospitals shall have been exhausted; and

"Further Be It Resolved, that a copy of this resolution be forwarded to the House of Delegates of the Medical Society of the State of New York and to the American Medical Association; and

"Further Be It Resolved, that a copy of this Resolution be forwarded to the United States Senators from New York State and to the Representatives in Congress from the thirty-seventh district of New York State."

This resolution directs the attention of this organization to many other abuses of hospital and medical service by veterans. For example, the treatment of veterans for injuries entirely distinct from their war disabilities

and illnesses. The Committee suggests that this problem be considered by the Council of this Society for further action.

I move its adoption.

Motion seconded and carried.

54. PHYSICAL THERAPY (Par. 40)

Dr. Thomson: This Reference Committee heartily approves the whole report of the Committee on Physical Therapy. The efficiency of physical therapy measures in proper cases has been definitely established. The indications for these, and the when and how of their administrations are medical questions and belong in the therapeutic armamentarium of the educated physician.

We recommend that the work of the Committee on Physical Therapy be continued under the Committee on Public Health and Medical Education and suggests that the able leadership of the present chairman be not lost with the end in view that future and further teaching of this subject to the doctors be continued as outlined in the present report of this committee.

I move the adoption of this report.

Motion seconded and carried.

The Speaker: Are there any other committees ready to report?

55. COMMITTEE ON SCIENTIFIC WORK (Journal, May 1, page 525)

Dr. Maslon: Your Committee notes with approval the change that has been made in the form of the program. The additional information contained therein, particularly the brief abstracts, of important papers to be delivered before the Scientific Program, will greatly increase the interest of this program.

Your committee recommends that the Scientific Committee continue this type of program.

I move the adoption of this report.

The motion was seconded and carried.

56. COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION (Journal, April 15, page 493)

Dr. Howland of Chemung: We wish to commend the Committee for the large amount of work accomplished in the past year in graduate medical education and public health. We urge the continuation of cooperation between the County Society and the Chairman of the Committee on Public Health and Medical Education.

We call particular attention to the cooperation between this committee and the State Department of Health, in the problem of the control of the poliomyelitis outbreak last summer and the appointment of the special committee to advise with the State Commissioner of Health.

We trust that later the Joint Report of this Committee and Health Commissioner Parran will be received.

We heartily endorse the study of the Committee in respect to the lowering of maternal mortality.

We endorse the suggestion of the Committee that the county societies be urged to cooperate in the study of maternal mortality with the State Commissioner of Health.

We commend the committee for their suggestion in urging a more prompt reporting of cases of tuberculosis.

Your committee strongly recommends that the House of Delegates approve the action of the Committee on Public Health and Medical Education in opposing any ruling of the Public Health Council which would disqualify any competent physician from accepting appointment as a county or municipal health officer.

I move its adoption.

Motion seconded and carried.

Dr. Howland: Your committee endorses the principle of appointing qualified local men as health commission-

ers, as recommended by the Committee on Public Health and Medical Education.

I move its adoption.

Motion seconded and carried.

Dr. Howland: Your committee is of the opinion that in the appointment of a County Health Commissioner, preference should be given to qualified local physicians, and that the County Medical Society should nominate a list of physicians from which the County Board of Health may make its selection.

I move its adoption.

Motion seconded and carried.

Dr. Howland: The committee is of the opinion that a County Health Commissioner should be a physician licensed to practice in the State of New York.

I move its adoption.

Motion seconded and carried.

Dr. Howland: Your committee is also of the opinion that practical experience in public health work should be considered an important qualification in the appointment of a County Health Commissioner.

We strongly endorse the action of the Committee in protesting against the public hearings of the Public Health Council being always held in New York City, thereby working a hardship to those most affected by its action.

I move its adoption.

Motion seconded and carried.

Dr. Howland: We congratulate the committee on the work accomplished and the keeping within their appropriations despite the large amount of extra work in connection with the Governors' Special Health Commission. We endorse the request of the Chairman of the Joint Committee for more time to consider State Aid.

I move its adoption.

Motion seconded and carried.

The Speaker: Is there anything further to come before the House?

57. RETIRED MEMBERSHIP

The Secretary: I have on my desk the names of a number of physicians that have been recommended to the State Society by their respective County Societies for election to retired membership.

Samuel T. Armstrong, Katonah; Louis E. Blair, Albany; Frank J. Blodgett, New York City; Ephraim W. Bogardus, Geneva; Albert H. Brundage, Woodhaven; Frank B. Carpenter, New York City; John Cotton, Burnt Hills; J. Clifton Edgar, New York City; Albert J. Frantz, Seneca Falls; Bern B. Gallaudet, New York City; William D. Garlock, Little Falls; Thomas F. Goodwin, Mount Vernon; Frank F. Gow, Schuylerville; Edwin A. Hatch, Brooklyn; Irving S. Haynes, Plattsburg; David John, Yonkers; Irving Le Roy, Utica; Benjamin G. Long, Buffalo; John F. McEncroe, Schenectady; Weldon K. McGowan, Conesus; Edward L. Meierhof, New York City; Robert C. Myles, New York City; John N. Shumway, Painted Post; Thomas S. Southworth, New York City; Ira Otis Tracy, Brooklyn; Cadwallader C. Vinton, New York City; Howard L. Waldo, Troy; John B. Walker, New York City; Daniel H. Wiesner, Mamaroneck.

I move that these gentlemen be placed on the retired membership list.

Motion seconded and carried.

The Speaker: Is there anything further to come before the House of Delegates before adjournment: I am about to declare an adjournment of this House until tomorrow morning, at which time the first order of business will be the election of officers. I am ready to listen to suggestions as to the hour.

Dr. Bedell: I move you, sir, we adjourn until nine a.m. tomorrow morning.

Motion seconded and carried.

The Session thereupon adjourned until May 24th, 1932, at 9 a.m.

ADJOURNED SESSION OF THE HOUSE OF DELEGATES,
TUESDAY, MAY 24TH, 1932

The meeting was called to order by the Speaker at 9 a.m.

58. ROLL CALL

The Speaker: The Secretary will please call the roll. The Secretary called the roll and the following delegates responded:

Frederic C. Conway, Charles A. Perry, Edgar A. Vander Veer, Lyman C. Lewis, John E. Conboy, Harry Aranow, Edward R. Cuniffe, Cornelius J. Egan, Isaias A. Lehman, Vincent S. Hayward, William A. Klein, Samuel M. Allerton, Harry I. Johnston, Joseph P. Garen, Raymond F. Johnson, Edgar Bieber, DeForest W. Buckmaster, Reeve B. Howland, Earl W. Wilcox, Leo F. Schiff, Charles J. Kelley, Robert Brittain, C. Knight Deyo, William A. Krieger, Aaron Sobel, Robert E. De Ceu, James H. Donnelly, Albert A. Gartner, Mary J. Kazmierczak, Edward J. Lyons, Francis M. O'Gorman, Milton G. Potter, Herbert A. Smith, Charles C. Trembley, Sylvester C. Clemans, Peter J. Di Natale, T. B. O'Neil, Joseph D. Olin, Charles T. Graham-Rogers, Alec N. Thomson, Siegfried Block, Thomas M. Brennan, E. Jefferson Browder, Frederic E. Elliott, Edwin H. Fiske, John M. Schimmenti, Edwin A. Griffin, William Linder, J. Sturdivant Read, Simon Frucht, Walter D. Ludlum, Joseph W. Malone, John J. Masterson, Harvey B. Matthews, Harold R. Merwarth, Joseph Raphael, Charles E. Scofield, James Steele, Luther F. Warren, William T. Shanahan, Donald H. Conterman, Clarence A. Costello, Walter A. Calihan, William A. MacVay, Willard H. Veeder, Floyd S. Winslow, Horace M. Hicks, Henry B. Smith, Everett C. Jessup, Emily D. Barringer, Edward M. Colie, Jr., C. Ward Crampton, Adolph G. G. De Sanctis, Ten Eyck Elmendorf, Julius Ferber, Samuel Z. Freedman, B. Wallace Hamilton, David J. Kaliski, Samuel M. Kaufman, Frederick C. Keller, Samuel J. Kopetzky, Richard Kovacs, Otto H. Leber, William M. Patterson, Nathan Ratnoff, Morris Rosenthal, Newton T. Saxl, Morris Schoenfeld, DeWitt Stetten, Terry M. Townsend, Franklin Welker, Orrin S. Wightman, Frederick J. Schnell, Richard H. Sherwood, George M. Fisher, Dan Mellen, Andrew Sloan, Frederick H. Flaherty, William W. Street, Albert G. Swift, Claude C. Lytle, Joseph B. Hulett, Alexander F. Carson, Carl Boettiger, James M. Dobbins, James R. Reuling, Jr., Abraham W. Victor, Albert L. Voltz, Augustus J. Hambrook, John H. Reid, Eugene D. Scala, Stephen R. Monteith, W. Grant Cooper, Stanley W. Sayer, George S. Towne, Dudley R. Kathan, William C. Treder, David W. Beard, Allen W. Holmes, Leon M. Kysor, Herbert B. Smith, Charles C. Murphy, Albert E. Payne, Luther C. Payne, Guy S. Carpenter, Wilber G. Fish, Frederic W. Holcomb, Morris Maslon, Walter A. Leonard, Ralph Sheldon, Harrison Betts, Merwin E. Marsland, Romeo Roberto, Reginald A. Higgons, Lester H. Humphrey.

The following Officers, Trustees and Chairmen of Standing Committees were present:

William D. Johnson, Chas. Gordon Heyd, Charles C. Trembley, Harrison Betts, Daniel S. Dougherty, Peter Irving, Frederic E. Sondern, James Pederson, John A. Card, George W. Cottis, James F. Rooney, Arthur W. Booth, Nathan B. Van Etten, Grant C. Madill, Harry R. Trick, Harry Aranow, Thomas P. Farmer, Herbert A. Smith, Arthur J. Bedell, Charles H. Goodrich, James E. Sadlier, Stanhope Bayne-Jones, Charles D. Kline, Louis A. Van Kleec, Herbert L. Odell, George M. Cady, E. Carlton Foster, W. Ross Thomson.

The following Ex-Presidents were present: Grant C. Madill, James F. Rooney, Arthur W. Booth, Orrin Sage Wightman, Nathan B. Van Etten, George M. Fisher, James E. Sadlier, Harry R. Trick, James N. Vander Veer, William H. Ross.

59. ELECTION OF OFFICERS

The Speaker announced that the meeting would proceed to the election of officers.

The Secretary announced the following tellers: Edward M. Colie, Chairman, Aaron Sobel, Alec Thomson, Horace M. Hicks, Frederick J. Schnell, Carl Boettiger, Augustus J. Hambrook, Harrison Betts, David W. Beard, Edgar Bieber, Vincent S. Hayward, and Andrew Sloan.

Dr. Bedell: I move that the election of the Chairman of the Committee on Arrangements be referred to the Council. Motion seconded and carried.

The following officers were elected:

President-Elect: Frederick H. Flaherty; First Vice-President: Arthur S. Chittenden; Second Vice-President: W. Ross Thomson; Secretary: Daniel S. Dougherty; Assistant Secretary: Peter Irving; Treasurer: Frederic E. Sondern; Assistant Treasurer: James J. Pedersen; Speaker: John A. Card; Vice-Speaker: George W. Cottis; Trustee: James F. Rooney; Chairman of the Committee on Scientific Work: Arthur J. Bedell; Chairman of the Committee on Public Health and Medical Education: Thomas P. Farmer; Chairman of the Committee on Legislation: Harry Aranow; Chairman of the Committee on Medical Economics: Charles H. Goodrich; Chairman of the Committee on Public Relations: James E. Sadlier.

The following were elected Delegates to the American Medical Association: Drs. Charles H. Goodrich, Frederic E. Sondern, William D. Johnson, Arthur J. Bedell, Harry R. Trick, John A. Card, Edward R. Cuniffe, Grant C. Madill, Floyd S. Winslow and Thomas M. Brennan.

The following were elected Alternates to the American Medical Association: Drs. Thomas P. Farmer, Walter D. Ludlum, Terry M. Townsend, Edward M. Colie, Jr., Andrew Sloan, Carl Boettiger, David J. Kaliski, DeWitt Stetten, Albert G. Swift and George S. Towne.

The Speaker: Is there any further business to come before the house?

60. STATE CLINICS FOR INJURED WORKMEN

(Par. 9 and 49)

Dr. Townsend of New York: Mr. Speaker and members of the House of Delegates, the Committee on Medical Economics presents the following:

WHEREAS, Mr. Howard S. Cullman, chairman of a committee appointed by Governor Franklin Roosevelt to review Medical and Hospital problems in connection with workmen's compensation law made a report last February in which appeared a recommendation for the establishment of State Clinics for care of injured workmen; and

WHEREAS, in rebuttal to criticism of such recommendation, Mr. Cullman in a written statement published in the *New York Times* Tuesday, May 17th, 1932, says: "The Committee's plan was formulated by group of physicians and surgeons of unquestioned integrity and ability, after mature study and deliberation," and

WHEREAS, on May 21st of this month, Dr. Adrian V. S. Lambert, Chairman of the Medical Sub-Committee, in a communication to the Economics Committee of this Society, says:

"This plan was proposed by a sub-committee on Departmental Procedure of the General Committee. There was no physician a member of this sub-committee—The plan was placed in the report by majority vote of the General Committee." And

WHEREAS, on the 20th of this month, Dr. James Alexander Miller, in a communication to the Economics Committee of this Society says: "The majority of the medical members of the committee, however, thought that the problem should be met in another way, and

consequently a supplementary statement—was prepared—although not incorporated in the body of the report, as such."

Your Reference Committee on the Report of the Committee on Medical Economics, to whom has been referred the Resolutions presented by Dr. F. E. Elliott, recommends the adoption of those Resolutions together with their recommendations.

1. The Medical Society of the State of New York declares that the statements of Mr. Howard S. Cullman were either made upon the basis of insufficient information as to the facts, or purposefully to attempt to bolster up a position taken on false premises.

2. That organized medicine and its principles were represented by only one of the four medical members of the Governor's Commission.

3. That the Medical Society of the State of New

York reaffirms its position in support of the public welfare in opposition to the institutional State Clinics for the care of injured workmen.

I move the adoption of this report.

Motion seconded and carried.

61. ADJOURNMENT

The Speaker: Mr. Secretary, is there anything on your desk that needs attention?

The Secretary: There is not.

The Speaker: Have Reference Committees A, B, and C on new business anything to report?

On motion duly seconded and carried the House of Delegates adjourned sine die.

JOHN A. CARD, *Speaker.*

DANIEL S. DOUGHERTY, *Secretary.*

NEWS NOTES

SECOND DISTRICT BRANCH

An outing meeting of the Second District Branch of the Medical Society of the State of New York was held on the afternoon and evening of Wednesday, June 8, 1932, in the Lawrence Country Club on the Rockaway Peninsula, overlooking the eastern end of Jamaica Bay. The total attendance was eighty. The President of the Branch, Dr. L. A. Van Kleeck, of Manhasset, and the Secretary, Dr. Alec N. Thomson, of Brooklyn, had arranged the outing in cooperation with the Queens County Medical Society, which acted as host to the Branch. The events were under the immediate supervision of Dr. A. W. Victor, Far Rockaway, President of the Queens County Society and Dr. M. L. Soners, Chairman of the Committee on Arrangements.

The afternoon program consisted of a golf tournament, in which fifty contestants were entered. A Prize given to the County Society whose members made the highest average score, went to Kings County. Eleven individual prizes, each consisting of a box of golf balls, were awarded to individual contestants.

Sixty members sat down to supper, after which the toastmaster, Dr. Victor, President of the County Society that was entertaining the Branch, introduced six speakers. It had been planned that the meeting should be purely recreational; but the good-fellowship and satisfying supper reacted

to produce receptive minds on part of the members. The speaking was, therefore, in a serious vein, and revealed the deep interest of the members in the activities of the Branch.

The field of the Second District was described by Dr. L. A. Van Kleeck, its President. The Medical Society of the State of New York was represented on the speakers' list by the following officers:

Dr. Chas. Gordon Heyd, President.

Dr. D. S. Dougherty, Secretary.

Dr. Charles H. Goodrich, Chairman of the Committee on Economics.

The greetings of the Medical Society of the County of Kings, the second largest in the state, were extended by its President, Dr. W. Linder, of Brooklyn.

The speaking was closed with a vein of humor expressed by Dr. Joseph Baum of Far Rockaway.

All the speakers emphasized the importance of personal acquaintance and good fellowship, both of which characteristics were in full evidence during the afternoon and evening.

The regular meeting of the Second District Branch will be held in November, after plans which were carried out last November with unusual success. (See this JOURNAL, December 1, 1931, page 1471.)

WOMEN'S MEDICAL SOCIETY

The Twenty-sixth annual meeting of the Women's Medical Society of New York State was held in the Town Club, Buffalo, on May 23, 1932, with the President, Dr. Marion S. Morse, of Binghamton, presiding. As is the custom of the Society, the women physicians meet on the first day of the House of Delegates, and then attend the meetings of the State Society. The Women members number about 125, and carry out a program which will do credit to their professional brothers.

A feature of the work of the Women's society is its support of from two to six Chinese girls while they are in training in Shanghai for the medical missionary field. This is done through the Committee on Medical Education, of which Dr. Mary A. Greene, of Wyoming County, is chairman.

The women doctors prepared a pageant on "Medicine from Early Times"; and had given it first in the Rochester meeting in 1930. The

pageant, in an amplified form, was repeated in Buffalo. Its author was Dr. Mary Newman Sloan, of Buffalo.

The scientific program was as follows:—

Invocation: Dr. Mary T. Greene, Castile, N. Y.

Greetings from the New York State Medical Society, Dr. William D. Johnson, of Batavia, N. Y.

Women in Medicine, Dr. Louise Beamish-Hood, Buffalo, N. Y.

Cancer of the Spine, Case Report, Dr. Louise M. Hurrell, Rochester, N. Y.

Ascariasis, Case Report, Dr. Alta Sager Green, Williamsville, N. Y.

Ear Conditions in Childhood, Dr. Rosaria B. Rossell, Buffalo, N. Y.

Bronchopneumonia in Newborn Infants, Dr. Margaret Warwick, Buffalo, N. Y.

The newly elected president is Dr. Mary J. Kazmierczak of Buffalo.

GRADUATE FORTNIGHT

The fifth annual Graduate Fortnight of the New York Academy of Medicine is announced for the two weeks beginning October 17, 1932.

The subject of the Fortnight will be "Tumors, benign and malignant."

The plan of the Fortnight will be similar to that of the four preceding years, and will consist of the following features:

1. An exhibition of specimens, both anatomical and pathological, in the building of the Academy, 2 East 103rd Street, New York. About 3,000 specimens are expected.

2. Evening lectures on tumor growths during ten days of the Fortnight.

3. Thirty clinical meetings and demonstrations to be held in eighteen hospitals.

Physicians generally are cordially invited to attend the Fortnight. There will be no charge for any feature of the Fortnight, but experience has shown the necessity that admissions to the clinics shall be by card.

Information may be obtained from the Academy, either by personal call, or letter, or by telephone, Atwater 9-4700.

KINGS COUNTY

The regular stated meeting of the Medical Society of the County of Kings was held on Tuesday, May 17, 1932, in the MacNaughton Auditorium of the Library Building, 1313 Bedford Avenue, Brooklyn, N. Y.

The following Scientific program was carried out:

1. Address, "Gall Bladder Disease—End Results in a Study of One Thousand Cases," Russell S. Fowler, M.D., F.A.C.S., Brooklyn.

2. Address, "Experiences with Encephalography and its Evaluation in Clinical Neurology," Emanuel D. Friedman, M.D., New York City.

The Director of Medical Activities reported to the Council of the Society that the volume of work due to the activities of the various committees of the Society has steadily increased and consumes a great deal of the time of the staff.

The home relief plan of the city, as far as medical care is concerned, has had generous support from the profession, although only a small amount of service has been authorized to the acutely ill in their homes. Unless greater appropriations are made, no funds will be available to continue the medical work and even other phases of relief.

The Milk Commission and the Special Committee appointed by the Council have been particularly active during the month. The profession is again requested to consider the use of Certified Milk because during the present period of stringency ordinary market milk may become of lesser nutritional value. The Director of Medical Activities reported that he had visited all of our Certified farms during the month of April.

The Society continues to receive inquiries from the laity regarding problems of relationship between the physician and the patient. The Director stated that the information service of the County Society endeavors to give advice and guidance to those seeking our aid. Some of the inquiries indicate a lack of tact and diplomacy in

explaining medical procedures to patients or those responsible for their welfare.

The Brooklyn Cancer Committee, which is identical in its professional representation with the Sub-committee on Cancer of the Committee on Public Health, has met and reviewed the work for the year. The committee determined to continue the policy of a minimum of publicity propaganda to the laity with a maximum of work with the medical profession. It is endeavoring to evolve a cooperative plan that will make possible the employing of a person to assist in a factual study of the cancer situation in Brooklyn. This fact finding is to include the social, economic, diagnostic and treatment phases of the problem as it confronts the physician and the community.

The Co-ordinating Committee of the Five County Medical Societies held its regular meeting on April 27th. The Committee on Illegal Practice received but few complaints during the month and verbal reports were received from the authorities concerning complaints in process of investigation. The Sub-committee on Radio Broadcasting of the Committee on Public Health continues to further the educational activities of the Society in preparing and supervising programs of interest to the laity.

The Director received a report that the special diphtheria program of the Health Department in the Red Hook area of Brooklyn had been completed; that the next area to be covered will be the Fort Greene District; that the social service agencies, the churches, the unions, and the hospitals had agreed to cooperate; and that the physicians of the district will be visited by a representative of the Health Department.

The Committee on Legislation suggests that state-wide groups of laymen concerned with maintaining the interests of medicine and medical progress be formed to show the public that their own best interests lie in opposing legislation

that would shackle scientific research and hinder the promotion of public health.

The committee feels that lay leaders such as school teachers, ministers, merchants, and the like, should be banded together in an intelligent

and vital effort to combat inimical and fanatical legislation. These groups would serve no interests but their own and make their presence felt by militant measures to defend their rights against the onslaughts of quacks and charlatans.

MONROE COUNTY

A special meeting of the membership of the Medical Society of the County of Monroe was held on April 19th under the auspices of the Tuberculosis Sub-Committee of the Society. Those present included an especially invited group of hospital social workers, public health nurses, and representatives of the County Tuberculosis and Health Association. The meeting was arranged as part of the program devoted to the commemoration of the fiftieth anniversary of the discovery of the tubercle bacillus by Dr. Robert Koch.

The program consisted of ten-minute talks as follows:

"The discovery of the tubercle bacillus by Dr. Koch," by Dr. Konrad Birkhaug, of the Rochester University Medical School.

"Diagnosis of Tuberculosis," by Dr. John J. Lloyd, chairman of the subcommittee on Tuberculosis and chairman of the County Tuberculosis and Health Association.

"Contact Cases," by Dr. E. G. Whipple, chairman of the Public Health Committee of the County Society.

"Education in Tuberculosis," by Dr. Ezra Bridge, Superintendent of the Monroe County Tuberculosis Sanatorium.

"The Family in the Spread of Tuberculosis," by Dr. E. K. Richard, Medical Consultant of the County Tuberculosis and Health Association.

"Community Control," by Dr. R. E. Plunkett, Director of the Division of Tuberculosis of the State Department of Health.

"Medical Leadership," by Dr. Thomas Parran, Jr., State Health Commissioner.

The regular meeting of the Medical Society of the County of Monroe was held in the Academy of Medicine Building, Rochester, N. Y., on May 17, 1932.

The meeting was called to order by the President, Dr. B. J. Slater.

Drs. Vida Matthews, R. N. Ritchie, E. H. Vail and Meyer Gerin were elected to membership.

The following resolution presented by Dr. A. S. Miller was adopted:

"WHEREAS, The State Medical Societies of several of the States are preparing and publishing valuable histories of medicine in their respective states, and

"WHEREAS, The Medical Society of the State

of New York has not undertaken any such publication recently, and

"WHEREAS, There exists among the membership of the Medical Society of the State of New York, men who have shown a real interest and aptitude to engage in historical study, be it therefore

"Resolved, That delegates from the Medical Society of the County of Monroe present at the annual meeting of the House of Delegates the matter of considering the appointment of a Committee to undertake the preparation of a History of Medicine in the State of New York."

The secretary announced that the following letter has been forwarded to all of the town boards and other appropriating bodies in the County.

"At the last meeting of the Comitia Minora (governing Board) of the Medical Society of the County of Monroe, on the recommendation of the Public Health Committee, it was voted to urge the appropriate bodies of town, city and county, and the Rochester Community Chest, to make every effort to maintain unimpaired health objectives, and to retain qualified and trained personnel and services which have proved their worth in safeguarding the first wealth of every community—the health of its people.

"We would appreciate it if you would read this resolution at the next meeting of the Town Board, with the added word that specifically the intent of this resolution as it refers to your Board is to urge that every effort be made to avoid the reduction in appropriation for health protective services and those for the care of the indigent sick, including particularly provision for nursing service and for immunization against diphtheria of preschool age children, and the control of communicable diseases.

"It is a recognized fact that priceless as is the power to cure disease, power to prevent it is worth far more to the community."

The personnel of the Periodic Health Examination Committee was announced as follows: Dr. Sol. J. Appelbaum, Chairman; Drs. Faxon, Kaiser, Morris, Sawyer, Slater and Whipple.

The speaker of the evening was Dr. Royd Ray Sayers, Chief Surgeon U. S. Bureau of Mines, Washington, D.C., on the subject "Physical examinations of workers engaged in hazardous occupations."

The meeting adjourned at 10.15 p.m.

WILLIAM A. MACVAY, M.D., *Secretary.*

DUTCHESS-PUTNAM COUNTY SOCIETY

A regular meeting of the Dutchess-Putnam Medical Society was held Wednesday, May 18th, 1932, at St. Francis Hospital, Poughkeepsie, N. Y. The meeting was called to order by the President, Doctor William A. Krieger at 9:00 P.M.

The minutes of the previous meeting were read and approved.

Doctor Roberts offered the following resolution which was adopted.

Your Committee on the Blind has taken into consideration the letter dated March 11, 1932, from Grace S. Harper, Executive Secretary of the Commission for the Blind and wishes to present the following resolution:

WHEREAS it is believed that the recent recommendations of the Commission for the Blind are of great importance for the prevention of blindness in infants, BE IT RESOLVED

1. That the members of the Dutchess-Putnam Medical Society are hereby urged to adopt the following procedure in all cases of ophthalmia neonatorum irrespective of whether or not such cases appear to be gonorrheal in origin:

a. Prompt hospitalization.

b. Isolation with the mother to assure breast feeding, this isolation to be continued until two specimens of exudate from the eye, taken two days apart, are reported negative for gonorrhea.

c. Supervision and treatment of the mother, if infected with gonorrhea, to safeguard the baby at any future pregnancy.

d. Prompt reporting to the health officer of all cases.

2. That the members of this Society take cognizance of the fact that delay in making hospital arrangements because of financial difficulties is unnecessary, due to the fact that the State Commission for the Blind, 80 Center St., New York City, has a revolving fund by which means it is possible to underwrite hospital expenses temporarily, pending arrangements for local funds; that hospital arrangements may be made in such cases with the Commission by long distance telephone or by telegram; and that if cases require hospitalization at times when the Commission office is closed, they may be sent at once to a hospital on the responsibility of the Commission, providing notification of such action is forwarded immediately to the Commission office.

3. That the Secretary of the Society transmit a copy of this resolution and the action of this Society thereon, to the Commission.

A communication from Doctor Bloodgood was read and ordered filed with the Cancer Committee. It was also voted to invite Doctor Bloodgood to visit the Society at the Fall meeting if possible.

The scientific program consisted of a paper by Dr. LeRoy W. Hubbard, Director of Extension, Georgia Warm Spring Foundation, "After-Care Treatment of Poliomyelitis," illustrated with motion pictures.

H. P. CARPENTER, *Secretary*.

BRONX COUNTY

A regular meeting of the Bronx County Medical Society, held at Elsmere Hall on May 18, 1932, was called to order at 9 P.M. with the President, Dr. Smiley, in the Chair.

Drs. Abraham Bellwin, Vincent P. Casey, Julius Kavee, William Levine, Sigmund Nagel and Henry A. Wahn were elected members.

Dr. Projector, Chairman of the Arbitration Committee in Compensation Cases, reminded the members of the proper procedure in connection with the work of the committee.

The secretary read the report of the subcommittee criticizing the majority report of the Governor's Committee to Investigate Medical and Hospital Problems under the Workmen's Compensation Law. The Comitia Minora recommended that the report of the subcommittee be adopted. The President announced that it has

already been approved by the other County Medical Societies of Greater New York. It was then moved and carried that it be adopted by the Bronx County Medical Society and presented at the annual meeting of the State Society in Buffalo.

The Society adopted resolutions on the death of Dr. Charles S. Bumstead, an honored member.

Dr. Benjamin H. Archer, Chairman of our Committee on Medical Economics, presented a paper on "A Plan to Establish Private Group Clinics in the County of The Bronx."

Dr. Lewellys F. Barker, Emeritus Professor of Medicine, Johns Hopkins, Baltimore, read a paper on "The Evolution of Group Practice, Retrospect and Prospect."

I. J. LANDSMAN, M.D., *Secretary*.

THE DAILY PRESS

Mr. and Mrs.—

Applying Stage Manners to the Home

From New York Herald Tribune, April 6, 1932

DESTINY OF MAN

Shakespeare commented on the final destiny of man's body by saying:

"Imperial Caesar, dead and turned to clay
May stop a hole to keep the cold away."

It is common to call a man a "poor fish," but one of the European nations has officially classified his body as "dried fish," according to an editorial in the *New York Sun* of May 4.

After describing the normal life of an Egyptian whose mummy was recently sent to Europe, the *Sun* says:

"One day he died and was buried with elaborate funeral ceremonies. He was entombed in a vault furnished with all the accoutrements, ornaments, utensils, weapons, servants, food and statuary customarily prepared for the use of the dead

so that their future destiny would be quite as happy as the worldly life they left behind when they died.

"Centuries passed before archæologists dug in the sand and found the tomb of the man of ancient Egypt. Eventually his mummy was sent northward on a long journey out of Egypt and across the Mediterranean Sea to Poland, where it was to become one of the treasures in the Warsaw Museum. But to the customs officials of Poland the body of the man from Egypt was only imported merchandise on which a duty had to be collected. The Polish tariff had no provision covering imported mummies. After some perplexity the customs officials finally decided this week to admit the man from Egypt, but they classified his mummy as 'dried fish.'"

THE CRY-BABY

Angelo Patri, the Principal of one of the Public Schools of Brooklyn, writing his "Know Your Child" column in the *Brooklyn Daily Eagle* of April 29, gives the following practical advice about the cry-baby:

"The little child is soon trained. If you say 'No' and stick to it, tears or no tears, and use plenty of cool water to wash away the tears, he soon learns not to cry. But the older child who has formed the habit is harder to cure. Make it a rule that he gets nothing for crying but a good face washing. Every time he weeps he is to go to the bathroom and wash his face and hands. He is not to appear before others with signs of tears. Crying is a purely private matter.

"If you enforce this idea and insist that crying be done privately, half the fun of the weeping has departed. An audience lends spice to tears and temper. Take that away and there is little left.

"Never tease a cry-baby. Let him alone. Do not mention his weakness to other people, and be more than careful not to speak of it in his presence to other people. Such children are unusually sensitive. They are carrying a heavy burden of self-consciousness, self, self, and only self, fills their minds. This is not their fault, but it is their misfortune. Treat them for that and help them.

"Always give the cry-baby something to do. Give him some light task that makes him move about, do something that he rather likes to do. That takes him out of the presence of other people, which is desirable. It takes his mind off himself and directs it away from himself, which is essential to his mental health. If he breaks down and cries, send him, with a gesture, to wash himself free of tears.

"Before treating a cry-baby have him examined by a responsible children's specialist."

TOAD PRODUCTS

People have forgotten the jewel that lay in the toad's head, but they still remember the warts that it brings one handling it according to popular belief. The New York *Sun* of May 9 has the following editorial description of some of the therapeutic products that are actually secreted by the toad.

"Modern science shows that the ancients, in ascribing valuable properties to the squat amphibian, were right; they simply lacked the ability to determine what these properties were. The discovery that toad poisons are a promising source of powerful medicines was reported the other day to the Federated Societies for Experimental Biology. Adrenalin was yielded by the poison glands of twelve species of toads from five continents. Powerful chemicals called bu-

fogins and bufotoxins, with medicinal effects resembling those of digitalis, were found, in addition to seven kinds of bufotenines, potent substances that stimulate the heart. The toads also supplied ergosterol, the mother of vitamin D. Placed under ultra-violet light, this chemical produced enough vitamin D to cure rickets in rats.

For centuries the Chinese have used for sinus trouble, inflammatory pains and nose bleed a toad poison medicine called ch'an su. Occidental science has now shown why the Oriental essence was efficacious. The extracts are the results of several years' work by Dr. K. K. Chen and Dr. A. Chen, of the Lilly Research Laboratories, Indianapolis, and Dr. H. Jensen of Johns Hopkins University."

ANTI-VIVISECTION

The New York *Herald Tribune* of May 31 contains the following editorial on anti-vivisection:

"The New York State Medical Society has passed, unanimously, a resolution calling upon its members to resist the danger of anti-vivisectionist agitation and legislation. It appears that this battle is so far from won that it may have to be fought all over again; that the threat of laws which may stop all experiments upon live animals is serious; that the professed ideal of the anti-vivisectionists is high enough, their voices loud enough and their endowment large enough to make determined opposition necessary.

"Anti-vivisection may be described as elephantiasis of the instincts of mercy and justice. The anti-vivisectionist does not state that the sufferings of laboratory animals (which he grossly exaggerates) are too great a price to pay for human health; he goes much farther and, blinded by his sense of mercy, denies that the experiments or the remedies derived from them are useful to health at all.

"A study of the pamphlets circulated by the New York Anti-Vivisection Society is instructive. Here we find, in language bordering on

hysteria, statements to the effect that if the muzzel is abolished and dogs are given water 'Pasteurism will die a natural death'; that anti-rabic inoculations are dangerous in any case, murderous in some, and give hydrophobia instead of curing it; that there is no such disease as hydrophobia, anyhow, and that both hydrophobia and lockjaw may be cured by taking a very hot bath; that a cure for cancer is 'within reach of all'; that germs are the result, not the cause, of disease, and 'may be inhaled or ingested without harm'; that parents should refuse to let their children be inoculated against diphtheria; that it is the 'passionate cruelty' of the 'lustful vivisection' that 'occasions the sacrifice of millions of sentient beings on the altar of the false god—science'; that 'smallpox probably would be as extinct as the black plague but for the efforts of the vaccinators and the serum manufacturers to keep it alive as a matter of business'; that 'vaccination sows the seed of erysipelas, scrofula, cancer, leprosy, consumption, eczema, syphilis, etc.'

"What sows the seeds of anti-vivisection, that pathetic disease of one of our highest centers, that hypertrophy of the human heart?"

HARD TIMES FOR PRISONERS

The New York *Times* of May 16 suggests one excellent result of hard times in the following editorial:

"Speaking about the ill wind that blows nobody any good, there is the finding of the secretary of the State Commission of Correction that the depression has made prisoners more tractable.

"They have food and clothing and a roof over their heads—elemental necessities which some of

their freer brethren are finding it increasingly difficult to obtain these days. But that is not all. If they were to escape in the midst of hard times, the lack of available jobs might force them to apply for public relief. That would be likely to result in their prompt apprehension, with an added prison sentence. Mr. Tremain goes so far as to predict that there will be no more riots until the depression ends."

BOOK REVIEWS

MIDWIFERY. By Ten Teachers, under the direction of COMYNS BERKELEY, M.A., M.D. Edited by COMYNS BERKELEY, J. S. FAIRBAIRN and CLIFFORD WHITE. Fourth edition. Octavo of 740 pages, illustrated. New York, William Wood & Company, 1931. Cloth, \$7.50.

The authors of this text book are all teachers in London medical schools, and represent the thought and teaching in eight general hospitals, and in three large lying-in hospitals in London. The whole corps of authors has acted in an editorial and revisional capacity on each chapter of the book, so it has acquired more uniform characteristics than is generally possible with collective authorship.

The first edition was published in 1917. This new, fourth edition has been extensively revised, and brought down to date. The Physiology of Ovulation and Menstruation, Toxaemia of Pregnancy, Abortion, Puerperal Sepsis, and Anesthesia in Labor, have been almost completely rewritten, and new matter has been added on Medical Induction of Labor and Blood Transfusion.

This book was written for students, and it is certainly an excellent text book. It is clearly written, practical, and well arranged. As a reference book, too, it has much to commend it, and the volume should find a place in the libraries of obstetricians and other medical men who may occasionally wish to refresh their memory on the subject of normal or abnormal pregnancy.

W. S. S.

THE FUNDUS OF THE HUMAN EYE. An illustrated atlas for the physician. By ERNEST CLARKE, C.V.O., M.D. Octavo of 51 plates. New York, Oxford University Press, 1931. Cloth, 18/. (Oxford Medical Publications.)

An effort to meet the requirements of the general practitioner and interest in a compact atlas of fundus paintings has been attempted by a number of authors. The accurate reproduction of proper tints and shades to give a realistic effect is difficult. The creation of the effect of relief of various details is practically impossible except by the use of the stereoscope. This relief is obtained by the ophthalmoscopist through the phenomenon of parallax. The slight unconscious movements of the examiner's head and the patient's eye give the impression of depth. It might be possible to attain a similar effect by embossing the elevated portions of the pictures. The authors of such atlases would do well to impress upon the reader that the pictures presented are idealistic representations, that they are composites of numerous views of disc shaped areas of observation and that it is from these smaller pictures of various entities from which the observer creates a mental picture similar to that depicted by the artist. These smaller atlases certainly have a place in the necessary reference literature, and the volume under discussion supplies a beautiful and useful source. One might feel that the refinements of color do not exactly meet his idea of the actual appearances but after all the variation of tint and shade is very great from case to case and different observers do not see them under the same conditions. The minor deficiencies of our color sense are very common. The preface of this volume stresses the value of the pictures as an aid to interpretation. It has become an axiom that our errors of diagnosis are more commonly through our overlooking the details of the presented evidence. If this is so, one would feel that the descriptive matter with the plates is inadequate. It would have been well to

call the student's attention to the features of the many details making up the whole. Perhaps an introduction dealing with the analysis of the findings observed would supply the want and enable the student to develop a logical method of putting together his findings so as to assure it a true interpretation.

The addition of a few pages for this purpose would not render the work too cumbersome. The reviewer would warn the student that too much should not be expected from a volume of this type, and he feels that he can recommend it as well worthwhile.

JOHN N. EVANS.

PHANTASTICA NARCOTIC AND STIMULATING DRUGS. Their Use and Abuse. By LOUIS LEWIN. Octavo of 335 pages. New York, E. P. Dutton & Company, 1931. Cloth, \$3.75.

The writer of this book, a German authority on drugs, has made an exhaustive study of this branch of the drug kingdom and has chosen to include many more substances than we are accustomed to consider. Moreover, he has also introduced us to a new title—"Phantastica"—to cover this vast field of unrelated chemicals.

From the standpoint of the physician reader this new coined word will convey a definite but an entirely different meaning, inasmuch as the author tells us things which should make us gasp with amazement. He tells us that "the Americans consume twelve times as much opium as any other people in the world." If that be true then we must modify our suspicions of obscure cases to include dope fiends as well as luctics. Furthermore, he warns us to suspect our confreres of being morphine habitues and he accuses 40% of doctors and 10% of doctors' wives of indulging in such practices.

There are many more statements which would even awaken a morphine addict out of his lethargic state. Were it not for the fact that the author of this book has made a profound study of this subject, such remarks as he has made would immediately be laughed off. However, we may choose to disagree with him we must realize that even though such statistics as he has offered appear sensational there may be some truth in his presentation and that he may possibly have erred in exaggerating facts than in stating an untruth.

EMANUEL KRIMSKY.

ANNALS OF THE PICKETT-THOMSON RESEARCH LABORATORY. Vol. VII. The Pathogenic streptococci: The Role of the Streptococci in Erysipelas Skin Diseases, and Measles. Quarto of 441 pages, illustrated. Baltimore, Williams & Wilkins Company, 1931. Paper \$10.00.

This book is the fifth volume of a series devoted to the streptococci, which have been prepared under the auspices of the Pickett-Thomson Research Laboratory of London.

These volumes are in the nature of an Encyclopaedia of bacteriological research in which the authors have carried out a plan of collection and classification of the thousands of papers published by research workers all over the world on this question of the relation of the streptococci to certain diseases.

The authors have accomplished a work of the utmost importance for the progress of medical science of today, and the research worker of tomorrow will be everlastingly grateful to them, for the time that they have saved him by their own patient toil. Despite the enormous

labor required they succeeded in this stupendous undertaking, and the present volume like its predecessors, represents a product containing the most complete study of the literature on the streptococci which has ever been published. Despite an unpretentious paper binding, it nevertheless represents a literary jewel for the medical reference library.

JOSIPH C. REGAN

CLINICAL ROENTGEN PATHOLOGY OF THORACIC LESIONS By WILLIAM H. MEYER, M.D. Octavo of 272 pages, illustrated. Philadelphia, Lea & Febiger, 1932. Cloth, \$6.00.

The first of a series in preparation dealing with Roentgen Diagnosis. The author in excellent teacher, presents the subject of Thoracic Roentgenology in a didactic, concise manner following his fashion of instruction as instituted at the Post Graduate Medical School. There are no references, the book being written to initiate proper Roentgen procedure and evaluation.

The physical, anatomic and pathologic factors are discussed especially as influenced by posture, exposure, technique, hydrostatic and other physical principles, following which a section is given to Roentgen Pathology, describing the various appearances of pathologic states as silhouetted by the Ray.

Diseases of the thoracic cage—lungs—pleura—mediastinum and heart complete the book, a final small chapter being given to oesophageal and subphrenic lesions insofar as intrathoracic differential diagnosis may be involved.

There are many reproductions including 113 original line drawings illustrating varying pathologic states. This alone is sufficient reason for its success. All students should profit richly by its perusal and to those engaged in teaching this specialty, the book comes as a most welcome addition to the family.

MILTON G. WACHT

MENTAL HEALERS Franz Anton Mesmer, Mary Baker Eddy, Sigmund Freud. By STEFAN ZWEIF. Translated by Eden and Cedar Paul. Octavo of 363 pages. New York, The Viking Press, 1932. Cloth \$3.50.

What a treat!

To those familiar with the previous writings of Stefan Zweig a work of this character needs no introduction and certainly no apology. In a style hypnotic in its free, soothing, flow and matchless charm the author presents proven historical facts colored by his own interpretation of their social significance. The word paintings of Franz Mesmer, Mary Baker Eddy and Sigmund Freud can not fail to impress, inform and entertain.

A spirit of tolerance pervades the entire book.

Few physicians are apt to recall that Franz Mesmer was a well known Medico established and socially prominent early in his career. Also a scholarly person with a scientific approach to problems. Today his name connotes a sort of hocus pocus. The author polishes our critical lenses and by placing them in a modern setting enables us to view a much damned physician with a new respect.

The author's description of the life and personality of Mary Baker Eddy is perhaps the most vivid and interesting. To a psychiatrist she is very real and quite human. Zweig emphasizes that her followers in attempting to gloss over the early not so pleasing life of this woman in an official rose coloured biography "have erred in submerging her very human qualities." The author's story of the harnessing of this iron will the persistent force of her hysteria making her a powerful force at fifty, makes an amazing and interesting modern romance.

Freud is treated in the same interesting fashion.

One is impressed with the tremendous labor involved in producing this book.

H. R. MERWARTH

CONTROL OF CONCEPTION An illustrated medical manual. By ROBERT L. DICKINSON and LOUISE S. BRYANT. Octavo of 290 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1931. Cloth, \$4.50. (Medical Aspects of Human Fertility Series issued by the National Committee on Maternal Health, Inc.)

The scientific and sociological premises upon which the practice of contraception are based are sufficiently set forth so that the reader is readily guided as to when advice to the patient is justified and as to the method applicable in a given case.

Dr. Dickinson's wide experience as a gynecologist and as a teacher, his talent for original illustrations and special aptitude for gathering medical data, are predominantly evident in this manual which he and his co-worker, Dr. Bryant, have written.

It is readily understandable that under such auspices the manual will appeal to the Medical Profession.

ADOLPH BONNER

HEALTH PROTECTION FOR THE PRESCHOOL CHILD A National Survey of the Use of Preventive Medical and Dental Service for Children under Six. Report to the Section on Medical Service, George Truman Palmer, Dr. P. H., Chairman Subcommittee on Statistics, etc. White House Conference on Child Health and Protection. Octavo of 275 pages, illustrated. New York, The Century Co., (c 1932). Cloth, \$2.50.

Another publication on the further report on the White House Conference on Child Health. Largely the statistical data gathered from all the states in the Union except six, concerning four major health preventive measures, namely:

- 1 Health examinations
- 2 Dental examinations
- 3 Vaccination against small pox
- 4 Immunization against diphtheria

The committee entrusted with this work has taken great pains to obtain as near authentic figures as possible both in rural and urban communities. The larger centers have given a better account of themselves owing to their more thorough organization.

This work was very ably conducted by the chairman of the sub committee, Dr. G. T. Palmer, of the United States Public Health Department who reported his findings in person during the conference in Washington.

Health authorities city and rural administrations and other interested in Child Health measures will find useful information in this publication.

HARRY APPEL

A HANDBOOK OF OCULAR THERAPEUTICS By SANFORD R. GIFFORD. M.A. M.D. 12mo of 272 pages, illustrated. Philadelphia, Lea & Febiger, 1932. Cloth, \$3.25.

It is truly a pleasure to review this concise practical work on ocular therapeutics. In the first place it does not discuss a great variety of agents which are new and untried. This does not mean that the most modern preparations are neglected. In fact, their consideration is very well developed.

Not only are modern drugs discussed but biological preparations are described and the technique for their use carefully outlined.

Various physical agents are also described. These include radium, ultra violet light, massage, diathermy and related procedures. Not only are the various agents discussed, but methods of management of various ocular diseases and special lesions are discussed. The oldest and most experienced ophthalmologist as well as the medical student would do well to secure this work at his earliest convenience. The reviewer predicts many editions for this real contribution to American ophthalmic literature.

JOHN N. EVANS

OUR NEIGHBORS

MEDICAL ECONOMICS IN WASHINGTON STATE

The April issue of *Northwest Medicine* contains the report of the Committee on Economics appointed by the House of Delegates of the Washington State Medical Association last August. The report begins as follows:

"The Committee on Economics elected by this body, begs to present to you the following report of its study of the economic conditions of the practice of medicine in the state of Washington. There are registered in this state:

"Doctors of Medicine	1920
"Osteopaths	375
"Chiropractors	450
"Drugless Healers	325

"The membership of the State Medical Association is 1368. The population of the State of Washington is 1,563,396 giving one licensed practitioner to each 508 of population. This does not take into account the Christian Science practitioners.

"A questionnaire was sent to each registered doctor of medicine in the state, of which there were 825 returned. The purpose of this was to get a cross section of the doctors of the state."

The questionnaire contained fourteen items, as follows:

1. Is your practice medical, surgical, special, or general?
2. Location of practice?
3. Are contracts prevalent in your community?
4. Are you in favor of industrial contracts?
5. Are you in favor of supplemental health contracts?
6. In your opinion are contracts advantageous?
7. Do you favor lodge practice?
8. Do you have any contracts?
9. Do you favor free choice of physicians?
10. Are you in sympathy with the complete state control of medicine?
11. Do you favor the panel system as practiced in England?
12. Do you favor voluntary or compulsory insurance for wage earners whose income is under \$2,000 per year?
13. Do you believe in paid solicitors or managers for doctors?
14. Do you believe in a minimum fee for contracts set by the state?

The purpose of the questionnaire was stated as follows:

"The chief purpose of the questionnaire was to call attention to the individual members of the association, the various economic problems that are confronting the sick and the various medical services. It is surprising to find how poorly informed the average doctor is, especially in reference to wage scales, incomes, general costs of living, insurance plans for the sick, what other countries are doing and what are his legal rights. Transplanted from hospital and medical school to a community, city or country, he is so busy with clinical practice, digging in and holding on, that he cannot see beyond his own circle, until he suddenly realizes that his income is falling off and he wonders what is the matter. Then he questions and looks around."

A discussion of the answers covers five pages of the Journal.

Compulsory insurance for wage earners whose income is under \$2,000 per year (Question 12) was discussed as follows:

"Sixteen per cent were in favor of voluntary insurance; fourteen per cent for compulsory and sixty per cent for insurance, type not specified, thus making ninety per cent who believe that some form of sickness insurance would be a good plan. In conferences with the county societies we found that most doctors were doing a large amount of charity work which could largely be taken care of through sickness insurance.

"Those favoring insurance argued that most families failed to, or could not budget their incomes to take care of sickness; it enables the workman to pay for medical care out of his own earnings; it distributes the cost of sickness over the many and is founded on solid insurance principles, and it assures the doctor of his fee. Others feared that it would be abused and lead to the dole system."

Question 13, on paid solicitors for doctors, will surprise the doctors of New York State. The discussion of the answers was as follows:

"Ninety per cent of the doctors were emphatically opposed to solicitors, while ten per cent believed that industrial clinics, hospital associations and those holding contracts absolutely need lay managers.

"Those who approved of managers and solicitors stated that a doctor's service is mostly scientific, that he has little inclination or ability to attend to the financial phase of practice and a manager would be a great help. Many clinics and hospital associations openly employ solicitors in

..and in cases of
Infantile Gastro-Enteritis

ROBINSON'S "PATENT" BARLEY is prepared in a strictly hygienic factory from the finest barley—dehusked and ground into a fine flour. Tested for quality. In sealed metal containers.

FOR over three generations physicians have prescribed Robinson's "Patent" Barley as a valuable modifier in the diet of healthy infants. But its use has been extended to meet many *abnormal* conditions, such as those caused by Summer Diarrhea in infants.

The evidence collected by many authorities leaves little doubt that this trouble is often initiated by bacterial contamination of cow's milk.

Injudicious feeding, too, particularly failure to give sufficient water, is now widely conceded to be a contributing factor.

Another aspect of the ailment—the Dehydration Theory—attributes the aggravation of Summer Diarrhea to excessive perspiration of the infant, with consequent thirstiness and fretfulness.

If at this stage the mother makes the mistake of giving the infant milk, overfeeding may aggravate the condition.

IN THE TREATMENT of Summer Diarrhea, Robinson's "Patent" Barley is valuable as a drink to replace milk, not only because it supplies the necessary liquids without overfeeding, but because its colloidal, non-irritating nature gives it valuable demulcent properties.

(Continued from page 764)

express defiance of the ethics of the American Medical Association. They claim they cannot obtain contracts, adjust claims and differences and conduct their affairs on a paying basis without solicitors. A few years ago a doctor was sued for six thousand dollars by his solicitor as his portion of an eighteen thousand dollar contract; the judgment was sustained by the supreme court and is a matter of court record. Our ethics are either right or wrong; if right, they should be sustained, and if wrong, they should be changed.

"The abolishing of solicitors is essential to maintain the ideals and standards of practice. It is expressly forbidden in our code of ethics but has not been enforced. Solicitation on the part of lawyers is sufficient grounds to revoke their licenses to practice and is so dealt with by the Washington Bar Association. The evils of solicitation are apparent to all; it constitutes an unfair method of obtaining practice, is often conducted through graft and is not very different from the methods of advertising doctors and institutions. Under the proposed new medical practice act it can be abolished through the board of medical examiners."

Graded fee schedules are discussed, as follows:

"A series of graded fee schedules for the different brackets of wage earners has also been suggested. According to a test case in the Supreme Court of Texas, 'a sliding scale for the costs of medical care is customary and fair. Patient and physician must concur in regard to the patient's ability to pay as a matter to be properly taken into consideration in fixing, by express contract, fair medical fees.' There could be one scale for incomes up to \$1,200 per annum, a second one for incomes from \$1,200 to \$2,400, a third one for \$2,400 to \$3,600, and above that fair medical fees.

"This would require no machinery, involve no laws and would be the offer of organized medicine to take care of the low wage earners at a schedule of fees within their incomes. These graded schedules should be determined by each county medical society, conforming to the differences in practices found in each community. Each county group of doctors has its own problems."

The report was presented to a special meeting of the House of Delegates on April third.

PUBLIC RELATIONS IN CALIFORNIA

This Journal of December 15, 1931, page 1554, printed an abstract of an account of a proposed Department of Public Relations in the California Medical Association, in accordance with the action of the House of Delegates on April 30, 1931. *California and Western Medicine* of February contains the minutes of a meeting of the

(Continued on page 767—Adv. xiii)

(Continued from page 766—Adv. xii)

Council held on January 16, 1932, which adopted the following resolution establishing the Department:

"Resolved, That a Department of Public Relations of the California Medical Association be and hereby is established, to consist of a director, an Advisory Committee, and those standing committees or commissions of the California Medical Association whose present functions deal with Public Relations, Public Health or Public Education. It is further

"Resolved, That the structure and function of the Department of Public Relations be as follows:

"1. The function of the Department shall be to promote the leadership of the medical profession in public health activities, public health education, legislation dealing with public health and medicine, and in the distribution of adequate medical care.

2. The actions, policy and budget of the Department shall be authorized by and subject to the approval of the Council of the California Medical Association or the Executive Committee, under authorization of the Council.

"3. The director of the Department shall also have the title of 'executive secretary' as provided by the Constitution of the California Medical Association. He shall be appointed annually by the Council at its reorganization meeting and his salary and duties shall be fixed by the Council. He shall be a graduate doctor of medicine but need not necessarily be a member of the California Medical Association.

"4. The director shall, with the cooperation of the Advisory Committee, assist the component committees of the Department in carrying out their respective duties as designated in the Constitution of the California Medical Association or as defined by the Council or House of Delegates.

"5. The Advisory Committee shall consist of the chairmen of the component committees or commissions together with the president, the secretary and the general counsel of the California Medical Association. The Advisory Committee shall be known as the Committee on Public Relations and shall assist the director in coordinating the work of the component committees. This committee shall select its own chairman and secretary (who shall also be the chairman and secretary of the Department at meetings thereof) and be governed by the provisions of Chapter V of the By-Laws of the California Medical Association regarding standing committees.

"The component committees of the Department of Public Relations at present shall be the Committee on Public Policy and Legislation, the Committee on Health and Public Instruction, the Committee on Medical Economics, the Committee on Hospitals, Dispensaries and Clinics, and the Cancer Commission. The Council at its dis-

COCOMALT—the delicious food-drink so useful post-operatively and in the treatment of undernourished children, convalescents, expectant and nursing mothers, etc.—is accepted by the Committee on Foods of the American Medical Association.

This delicious chocolate flavor food-drink is unusually high in caloric value—yet easily digested and readily assimilated. Children love it. Invalids and convalescents drink it eagerly. And every glass of Cocomalt is equal to almost two glasses of plain milk in caloric value; for by actual test Cocomalt adds 110 extra calories to a glass of milk and contains not less than 300 ADMA (30 Steenbeck) units of Vitamin D per ounce—the quantity recommended for one drink.

What Cocomalt Is

*Cocomalt is a scientific concentrate of partially defatted chocolate and milk, barley malt extract, whole eggs, sugar, flavoring and added Vitamin D. It comes in powder form, easy to mix with milk—HOT or COLD. Cocomalt can be purchased at grocers and drug stores everywhere.

FREE to Physicians

We will be glad to send to any physician requesting it a generous trial can of Cocomalt free.

*Cocomalt

cretion may add other committees to the Department."

The committee consists of certain officers of the California State Medical Association, and the Chairmen of certain committees. Its present personnel, as printed on advertising page 2 of the March issue of *California and Western Medicine*, is as follows:

John H. Groves, M.D., Chairman of the Committee on Medical Economics, Chairman.

Emma W. Pope, M.D., Secretary-Treasurer of the State Association, Secretary.

Junnis B. Harris, M.D., President.

Joseph M. King, M.D., President-Elect.

Harley F. Peart, General Counsel.

Fred B. Clarke, M.D., Chairman Committee on Public Instruction.

John C. Ruddock, Chairman of Committee on Hospitals, Dispensaries and Clinics.

Charles A. Dukes, M.D., Chairman of the State Cancer Commission.

The Council has chosen as Director of the Department Dr. Walter M. Dickie, former Director of the California State Board of Health, whose office will be at Room 2039, Four Fifty Sutter Building, San Francisco.

The Department plans to publish a special page in each issue of the Journal. That in the March Journal is a reprint of an article on Medical Insurance, by Michael M. Davis, Ph.D.

EXORBITANT MEDICAL FEES IN CALIFORNIA

The leading editorial in the March issue of *California and Western Medicine* is on the subject of exorbitant medical fees.

It opens:

"In an editorial printed in the January, 1926, number of *California and Western Medicine*, the last William E. Musgrave, former editor, discussed some of the evil effects which result to the prestige of the entire non-sectarian medical profession, through exorbitant charges by a comparatively small number of members of the profession.

"When the other day the present editor received a copy of an itemized statement for services rendered by a physician in a moderate-sized city in a mid-west state, to an elderly patient to whom he had been called to give treatment for a fractured neck of the demur, the editorial above referred to was called."

The itemized bill was as follows:

"February 2, 1930—Physical examination, diagnosis application of splint, etc.	\$ 250.00
"February 3, 1930—Operation, reduction of fracture, application of body cast, etc.	1,500.00

(Continued on page 769—Adv. xv)

(Continued from page 768—Adv. xiv)

"February 3 to April 15, 1930—145 hospital visits, including treatment of fracture and intravenous injection for chronic arthritis, and treatment of ulcers at \$10 per visit (Editor's note: A period of 70 days)	1,450.00
"March 10, 1930—Operation, removal of cast, reapplication of bivalved cast, curettement of ulcers and treatment of ulcers	850.00
"April 15 to May 4, 1930—Forty home visits, including treatment of fracture, intravenous injections for arthritis, treatment of ulcers at \$15	600.00
"May 4, 1930—Night house visit, five hours' detention with patient, injection of stimulants, artificial respiration, etc.; attempting to save patient from death, at \$50 per hour	250.00
"Total for professional services rendered	\$4,900.00
"Paid on account—Feb. 9, 1930, \$85; Feb. 17, 1930, \$35; Feb. 25, \$35; Mar. 1, \$35; Mar. 8, \$35; Mar. 15, \$35; Mar. 22, \$35; Mar. 29, \$15.	310.00
"Total paid on account	310.00
"Amount due	\$4,590.00

"Readers of *California and Western Medicine* can come to their own conclusions as to the justice of charges such as the above; and can estimate for themselves the effect which publicity of such charges will have in that particular community, in forming lay opinions on the local medical profession's standards of fair dealing."

The editor comments as follows:

"When it is realized that the small group of exorbitant fee chargers, more than almost any other factor, have in recent years destroyed much of the reputation formerly possessed by the medical profession for humanitarian and honorable dealing, it naturally follows that aloofness or non-discussion of deplorable exorbitant fee facts will only make matters worse, instead of better."

"It is the viewpoint of many physicians that this small number of exorbitant fee chargers who are scattered through the profession have in recent years brought more disgrace to a noble guild than did the shysters or out-and-out quacks of days gone by, who in that time were supposed to be part of us."

"If their misdeeds in the way of extortion reacted only upon themselves, then the profession would have little need to give them further thought. Unfortunately, however, every outrageous example of exorbitant fee charging is passed from lay person to lay person, until even

(Continued on page 770—Adv. xvi)

SARATOGA NATURAL MINERAL WATERS

For Acid Correction and Mild Purgation

STATE OWNED AND STATE BOTTLED

SARATOGA mineral waters offer to the profession a selection of naturally carbonated waters possessing valuable alkaline and saline properties. They have been characterized by medical experts as the peers of any waters now to be found in Europe.

Saratoga Geyser is a naturally carbonated alkaline water which has proven to be very beneficial as an aid in the treatment of many acid conditions including: acidosis accompanying gout, rheumatism, neuritis and diabetes, acid dyspepsia and hyperacidity.

Saratoga Hathorn No. 2, mildly purgative, and Saratoga Coesa, mildly laxative, are naturally carbonated saline waters possessing valuable catalytic activity. They have proven beneficial in hyperacidity occurring in cases of acid catarrh of the stomach and atony of the stomach, and in cases of dyspepsia due to mental over-exertion. Because of the sodium chlorid in these waters they are not recommended for patients with nephritis.

(Continued from page 769—Adv. xv)

well and kindly thinking members of the lay public are tempted to believe that nearly all members of the medical profession suffer from the same grasping dollar taint; except that some of the profession are more daring than others in the nefarious game. And because the stories of their excessive fees become a topic of general lay and professional conversation, these extortion specialists become powerful agents in seducing recent graduates from the profession's traditions of efficient service at decent compensation, to embark on careers of practice in which the sordidness of base monetary acquisitiveness becomes paramount to the doctrine of real service."

The editorial closes with excerpts from the editorials of 1926, citing instances of excessive medical charges.

STUDENT LOAN IN COLORADO

The March number of *Colorado Medicine* contains the following article on a loan fund for medical students:

"It has become an annual custom for the Voman's Auxiliary to the Denver County Medical Society to replace the regular February meeting with a subscription bridge party usually held at the Daniels and Fisher Tea room.

"This party is a benefit to raise funds for the Medical Student Loan Fund for the University of Colorado School of Medicine. At the regular meeting in December, 1928, largely as the result of the efforts of Mrs. T. Mitchell Burns who was then president, a motion was passed that the funds of the Auxiliary be used for some educational or philanthropic purpose, and a committee was appointed to take charge of the benevolent fund, as it was called. This committee recommended that at least \$100.00 be given annually to the Board of Regents of the University of Colorado Medical School to establish a student loan fund to be limited to junior and senior students.

"With the depression hitting the medical students as much as any one else, there has been a greater demand and far greater need

for loans. Dr. Maurice H. Rees, Dean of the University of Colorado Medical School, reports that there were fourteen loans made this year; he definitely knew of the need of five more and did not know how many were obtained outside of the institution—though he knew there were some. Because of the increased demand, each loan was limited for the first time to \$100.00 per student instead of allowing him the full sum needed as heretofore.

"This may give our county auxiliaries a suggestion for philanthropic work. If they have money at hand and so desire, they could contribute it directly to the Medical School or give (if they have not enough to start their own fund) through the Denver Auxiliary, thereby increasing this fund—full credit of course being given to the donating auxiliary. In this way, an auxiliary loan fund could be established to help our own profession; and who among us does not know of many outstanding and leading physicians today who struggled through great hardships, or who had to take years off at intervals between their courses in order to earn money with which to carry on toward the noble title of Doctor of Medicine?"

The VEIL MATERNITY HOSPITAL

WEST CHESTER, PENNA.

Strictly Private. Absolutely Ethical. Patients accepted at any time during gestation. Open to Regular Practitioners. Early entrance advisable

For Care and Protection of the BETTER CLASS UNFORTUNATE YOUNG WOMEN

Adoption of babies when arranged for. Rates reasonable. Located on the Interurban and Penna. R. R. and the Lincoln Highway. Twenty miles southwest of Philadelphia.

CLASSIFIED ADVERTISEMENTS

Classified ads are payable in advance. To avoid delay in publishing, remit with order. Price for 40 words or less, 1 insertion, \$1.50; three cents each for additional words.

WANTED: Salaried Appointments everywhere for Class A physicians. Let us put you in touch with investigated candidates for your opening. No charge to employers. Established 1896. Aznoe Service is National, Superior. Aznoe's National Physicians' Exchange, 30 North Michigan, Chicago.

ARLINGTON, New Jersey, 211 Stewart Av.—Attractive 7-room house; plot 120x103; oil burner; 2-car garage; 8 miles from New York City; 5 minutes' walk from station and bus lines; rent \$100 month or sell, easy terms, at a bargain price. Owner, Box 5, Care N. Y. State Journal of Medicine.

DOCTOR WANTED

This community on the North Shore of Long Island offers a splendid opportunity of service for general practice. It is now served by doctors from adjoining towns, some as far as 20 miles distant. My property is ideally situated for this purpose. The two houses and beautifully shaded lawns are adaptable as a residence with the cottage as office, laboratory, etc., or the whole as a small sanitarium. For particulars write C. H. Hazard, 295 Madison Avenue, New York.

SANITARIUMS—FOR SALE

We have a number fully equipped, some partially so, and properties that can be made suitable; New York, New Jersey, Connecticut. Send for list and give number of rooms wanted for patients (approximately), also location desired. Address Swift Realty Co., 196 Market Street, Newark, N. J.

HANOVIA CHEMICAL AND MANUFACTURING CO.

At the Annual Meeting of the Medical Society of the State of New York, recently held in Buffalo, the Hanovia Chemical and Manufacturing Company, Newark, N. J., had an excellent exhibit of their new super-intense ultraviolet lamps for general irradiation and for contact use with and without applicators. There were also shown the smaller and less intense Kromayer Oral Therapy Lamp designed especially for dental use, and the Physicians' Model Sollux Radiant Heat Lamp, which operates either with a 1,000-watt incandescent tungsten bulb or a 1,500-watt non-metallic resistor. These heat elements are interchangeable.

The outstanding features of the display, however, were the Super Self-contained Kromayer Lamp, affording an intensity capable of producing a first-degree erythema on contact in five seconds, and the handsome New Super Alpine Sun Lamp, announced as the most intense source of ultraviolet energy for therapeutic application, not requiring special wiring.

Among the many exclusive and valuable new features of this Super Alpine Lamp, perhaps the most important is the unique design parabolic reflector hood, whose reflecting surfaces are so placed as not only to multiply the effectiveness of the high-intensity burner to the equivalent of four unreflected burners operating

simultaneously, but also to project the rays so evenly over the field of irradiation that the distribution 30 inches from the burner is relatively uniform over an area 5 x 2 feet.

Several other innovations in the design of this lamp are of an importance warranting writing the company for further and detailed information.—*Adv.*

VITAMIN D CONTENT OF COCOMALT INCREASED

The Vitamin D content of Cocomalt has been increased and now contains not less than 30 Steenbock (300 ADMA) units of vitamin D per ounce—the quantity recommended for one drink. In addition to this richer Vitamin D content, Cocomalt contains a large supply of organic mineral salts, biologically favorable in their proportion of calcium and phosphorus. Mobilizing, as it does, the calcium and phosphorus present in Cocomalt, the Vitamin D content becomes especially effective in helping to ward off rickets and in promoting the development of strong bones and teeth. Cocomalt is licensed by the Wisconsin Alumni Research Foundation under Steenbock Patent No. 1,680,818. Physicians may secure samples from R. B. Davis Company, Hoboken, N. J. See page xiii.—*Adv.*

"WHEN, AS AND IF"

the bottle-fed baby exhibits symptoms indicating partial vitamin B deficiency—described by Hoobler as (1) anorexia, (2) loss of weight, (3) spasticity of arms and legs, (4) restlessness, fretfulness, (5) pallor, low hemoglobin, etc.—

Dextri-Maltose with Vitamin B may be used in adequate amounts (up to 71 Chick-Roscoe units) without causing digestive disturbance. This ethically advertised product derives its vitamin B complex from an extract of wheat germ rich in B and brewers yeast rich in G. Physicians who have attempted to make vitamin B additions to the infant's formula but who have been obliged to abandon same due to diarrheas or other unfortunate nutritional upsets, will welcome Mead's Dextri-Maltose with Vitamin B. This is a tested product with rich laboratory and clinical background and is made by Mead Johnson & Company, a house specializing in infant diet materials.

Not all infants require vitamin B supplements, but when the infant needs additional vitamin B, this product supplies it together with carbohydrate. In other cases, the carbohydrate of choice is Dextri-Maltose No. 1, 2, or 3. See page xxii.—*Adv.*

ELIXIR MEDINAL

There are frequent occasions when the physician finds it desirable to administer sedative and hypnotic medication in fluid form rather than in tablets,

capsules, or powder. Many patients prefer taking liquids and appear to have greater confidence in the remedy when given in this way.

To meet this frequently expressed preference, Schering & Glatz, Inc., have introduced Elixir Medinal in addition to the powder, tablets and suppositories in which Medinal, the well known hypnotic, has always been supplied.

Elixir Medinal affords all the therapeutic effects of Medinal—quick absorption, prompt action, rapid elimination and freedom from depressant effects. It is pleasingly flavored, completely disguising the rather persistent taste of the medication. Each teaspoonful contains two grains of Medinal. The sedative dose is one or two teaspoonfuls, repeated as may be necessary; as a hypnotic, two to four teaspoonfuls should be given a half hour before bedtime. The trade package contains six fluid ounces. See page ix.—*Adv.*

FRENCH VICHY AT THE N. Y. STATE MEETING

An instructive, as well as attractive, exhibit at the meeting of the Medical Society of the State of New York in May, was the one made in behalf of the Compagnie Fermière de l'Etablissement Thermal de Vichy, of Paris.

To those physicians who had visited Vichy, France, it was especially pleasant to renew their associations by a visit to the French Vichy booth at the Buffalo meeting.

Many of the doctors availed themselves of the opportunity of learning about the latest improvements that have recently been made at the Thermal Establishment of Vichy for the comfort and convenience of the patients at this famous Spa this season.

French Vichy water has been known to the medical profession for many generations and is shipped to all parts of the world.

The term "French Vichy" has become a common form of expression to indicate the famous Vichy Célestins, so widely known to all physicians, who absolutely rely upon this ideal alkaline water for home treatment.

It is just as agreeable to drink Vichy Célestins in bottled form after its long journey from Vichy, France, and it is just as effective in this form as if the patient had gone to Vichy and taken the water at the Spring.

In view of the marked differences in the therapeutic properties of various mineral waters, it is well to specify "Célestins" in prescribing or recommending Vichy; otherwise, an inferior or artificial form of "vichy" or one possessing different properties from those of Vichy Célestins may be substituted.

The American distribution of Vichy Célestins and the other products of Vichy Etat is in the hands of American Agency of French Vichy, Inc., 503 Fifth Avenue, New York. See page v.—*Adv.*

HERPES ZOSTER· REPORT OF A CASE OF THE PALM AND TWO FINGERS, AND FIFTEEN OTHER CASES, TREATED WITH PITUITRIN*

By HENRY D NILES, M D, NEW YORK, N Y

IN 1923, Vandell¹ was the first to report the results of injections of pituitrin in herpes zoster. He stated that the pain disappeared within a few hours after one injection and that the eruption involuted in several days. In a careful review of the literature I could find no further articles on this subject until 1930, when Sidlick² reported a series of fifty four cases of herpes zoster treated with pituitrin. Twenty of these patients were women and thirty four were men. The duration of the eruption varied from twenty four hours to five weeks. He was impressed by the marked relief from pain often occurring in even the most severe cases after only one or two injections, but he did not state the effect on the lesions nor how many patients, if any, failed to obtain relief.

Since the appearance of Sidlick's report, I have learned from several physicians that they have obtained equally good results and from a few others that they have not been so fortunate, but neither group could give a definite percentage of cures or failures. In order to obtain data on this subject and because of the inadequacy of other methods of treatment for the relief of the excruciating pain so often occurring in this disease, I decided to try this form of therapy. Sixteen patients with herpes zoster were given a total of thirty eight injections of pituitrin averaging 24 injections per patient. The average duration of the disease was 88 days. The results were as follows:

- 11 patients were well in an average of 85 days after the first injection
- 1 patient had some relief after 1 injection, final result unknown
- 1 patient was worse 2 days after first injection, final result unknown
- 1 patient had improved 2 days after one injection, final result unknown

2 patients showed no improvement after three and two injections, respectively

(See Table I)

Comment It is strikingly evident that the value of these injections varies inversely as the duration of the disease. The most brilliant results were obtained in the very early cases. The only failures occurred in the two cases of post herpetic neuralgia, in which there had been no eruption for eleven months and seven weeks respectively (the two longest durations in the series).

Technique The injections were given intramuscularly every other day. With the exception of one case, three injections were sufficient. 0.5 cc of pituitrin was given to elderly patients for the first injection and 1 cc to the middle-aged and younger. All except four patients received 1 cc at the time of the second and third injection. I used both surgical and obstetrical pituitrin. Although the former is considered to be stronger than the latter, I could notice no difference in the results obtained. None of the patients experienced any unfavorable local or general reaction, although several were elderly and suffered from intercurrent diseases. This treatment can be given safely to senile patients and to those suffering from hypertension, cardiac disease or diabetes. It is not necessary to delay or discontinue the injections because of menstruation but they should never be given during pregnancy.

As a control I compiled the histories of sixteen patients with herpes zoster who were treated in various other ways. The average duration of the disease was eight days. The results were as follows:

- 5 patients were well in an average of 11 days
- 1 patient was improved but the pain continued
- 4 patients were no better
- 6 patients did not return after the first visit, result unknown

(See Table II)

* From the Department of Dermatology and Syphilology, Cornell University Medical School Clinic, service of Dr. H. J. Schwartz.

TABLE I
REPORT OF 16 CASES OF HERPES ZOSTER TREATED WITH PITUITRIN

Sex	Age	Duration	Location	Description	Number of Injections	Result	Additional Treatment
M.	41	5 days	8th right intercostal.	Typical vesicles. Very little pain.	2 (0.5 c.c. and 0.75 c.c.) in 3 days.	Two days after first injection, no pain. Few vesicles showed dry necrosis. Most vesicles almost entirely dry. Two days after second injection, no pain, vesicles completely dry with a few remaining necrotic areas.	None.
F.	60	2 weeks (pain) 1 week (vesicles)	Back of ear, scalp, side of neck.	Typical vesicles. Severe pain.	5 (0.5 c.c.) every 3 days.	Vesicles dried up at once but pain lasted 5 weeks.	Lotion calamine and zinc oxide with 1% phenol.
M.	33	3 days	Left cheek, temple, ear, scalp.	Early, red, non-vesicular lesions, soreness but no pain.	3 (0.5 c.c., 1 c.c. and 1 c.c.) every 2 days.	Much better after first injection. Lesions dry with only very slight congestion after second injection.	Soothing lotion.
M.	70	11 months	Left side of scalp and neck and left shoulder.	No lesions for 11 months but severe continual pain when sitting up and at times when lying down.	3 (0.5 c.c., 1 c.c. and 1 c.c.) every 2 days.	No better.	Before injection, had 4 X-R skin unit $\frac{1}{4}$, filtered with 3 m.m. aluminum, without relief, as well as many topical remedies.
M.	23	3 days	Left side of neck, back of scalp.	Typical early lesions and large, slightly tender submental and cervical lymph glands.	2 (both 1 c.c.) in 3 days.	No pain and no new lesions after 1 injection. Entirely well after second injection.	Soothing lotion.
F.	25	4 days	Left side of jaw.	Deep, gangrenous ulceration. Submental and left cervical lymph glands large and painful.	3 (0.5 c.c., 1 c.c. and 1 c.c.) in 6 days.	No better after 1 injection. Lesions drier and glands smaller and less painful after second injection. Pain and swelling of glands gone and lesions dry after third injection.	2 X-R skin unit $\frac{1}{4}$, 1 week apart, healing salve and drying lotion.
M.	42	10 days	Left side of neck and back of scalp.	Typical lesions, left cervical glands enlarged and painful.	2 (1 c.c. and $\frac{3}{4}$ c.c.) in 4 days.	Marked relief from pain and itching. Glands small and painless after 1 injection. Final result unknown.	Drying lotion.
F.	75	7 weeks	Left side of face, scalp and left eye.	Severe eruption with pitted scars, intense pain. No active lesions for several weeks.	2 (1 c.c.) 1 day apart.	No relief.	None.
F.	26	1 week	Ulnar side of right palm and ring finger and little finger.	Typical vesicles. Moderate pain.	3 (1 c.c.) in 5 days.	Pain much less and lesions fading after first injection. No pain and lesions barely visible after second injection.	None.
M.	44	2 days	Right side of neck.	Round, red, edematous, vesicular patch, size of a quarter.	1 (1 c.c.)	Well in a week.	Calamine lotion with 1% phenol, and heat.
M.	18	3 days	Left hip and left side of sacrum and pubis.	Vesicular patches along course of 5th lumbar and 1st sacral nerve.	2 (0.5 c.c. and 0.75 c.c.) 1 day apart.	Some relief after first injection. Final result unknown.	Calamine and zinc oxide lotion with 1% phenol.

F. C.	F.	28	1 week	Right thigh and hip and right side of lower abdomen.	Many groups of vesicles.	3 (1 c.c.) every other day.	2 days	Relief in a few hours after first injection. Well after third injection.	Calamine and zinc oxide lotion with 1% phenol. Rest and heat.
C. S.	M.	42	1 week	Left side of forehead along course of ophthalmic nerve.	Vesicles on inflamed base.	2 (1 c.c.) apart.	2 days	Improved 2 days after first injection.	Calamine and zinc oxide lotion.
E. S.	M.	39	2 days	Right upper eyelid, right side of forehead and scalp.	Marked edema.	2 (1 c.c.) apart.	2 days	Worse 2 days after first injection. Final result unknown.	Boric acid wet dressings.
E. K.	F.	43	2 weeks	Along 3rd left intercostal nerve under shoulder.	Burning pain, grouped vesicles.	2 (1 c.c.) apart.	2 days	Pain much less 2 days after first injection. No pain and lesions gone 7 days after second injection.	Calamine lotion, atophan gr. 7½, q.4.h.
M. L.	M.	28	2 days	Shaft of penis.	Typical group of vesicles, itching and soreness.	1 (1 c.c.)		No soreness or itching and vesicles dried 2 days after injection.	Calamine and zinc oxide lotion.

TABLE II

REPORT OF 16 CASES OF HERPES ZOSTER NOT TREATED WITH PITUITRIN

Name	Sex	Age	Duration	Location	Description	Treatment	Result
M. D.	F.	51	5 days	Scalp and face.	Typical lesions and much pain.	Aspirin, heat, calamine lotion.	Improved in 1 week but pain persisted.
W. G.	M.	69	10 days	Back.	Typical lesions.	Atophan, calamine lotion with phenol (2%).	Well in 3 weeks.
J. H.	M.	67	3 weeks	Left supra-orbital.	Typical lesions.	Atophan and baume analgesique.	No better. Pain after 1 month.
L. T.	F.	54	3 days	11th right thoracic on abdomen.	Typical lesions.	Atophan.	Well in 11 days.
J. K.	M.	18	2 days	Right side of chest.	Typical grouped vesicles.	Calamine and zinc lotion.	Well in 6 days.
J. Z.	F.	38	10 days	Right axilla.	Typical patch with itching.	Calamine and zinc lotion with 1% phenol.	Itching present 12 days later.
J. L.	M.	38	3 days	Scalp, face and neck.	Edema and pain.	None. Care of teeth advised.	Bad pain 4 days later.
M. A.	F.	?	5 days	Right side of neck.	Typical lesions with burrowing.	Soothing lotion and rest.	?
W. B.	M.	39	2 days	Left side of neck, back and chest.	Many typical vesicles and superimposed dermatitis.	3 weekly X-R skin unit ¼.	Much improved in 1 week, almost well in 2 weeks.
M. D.	F.	22	1 week	Right buttock.	Dime-sized patch of vesicles.	Calamine and zinc lotion and oil of cade salve.	?
E. F.	M.	50	3 days	Left side of neck and face.	Typical lesions and pain.	Aristol powder, internal medication, diet.	Pain present after 16 days.
A. G.	M.	42	2 days	Right buttock.	Typical lesions and slight pain.	Dusting powder, calamine and zinc lotion.	?
E. H.	F.	36	2 days	Anterior part of left shoulder	Typical lesions and aching.	Mist. R. & S. with sodium salicylate.	Lesions dry. No pain in 4 days.
E. M.	F.	35	1 week	Right arm and hand.	Typical lesions and aching.	None. X-R teeth.	?
V. M.	M.	30	1 day	Pubis.	Occasional pain. Typical lesions. Bad itching.	Ichthylol in collodion and Mist. R. & S. with sodium salicylate.	?
T. R.	M.	37	7 weeks	Right side of abdomen.	Typical lesions. Severe pain.	Lotion and salve.	?

Comparison of the Two Series:

	Pituitrin	Other Methods (v. table)
Average duration before treatment..	88 days*	8 days
Number of patients well.	11	5
Average length of recovery.....	8.5 days	11 days
Number of patients improved.....	2	1
Number of patients unimproved.....	2	4
Result unknown	1	6

* This does not include patient A. R. who was treated for post-herpetic neuralgia of eleven months duration.

From the above comparison it can be seen that, although the duration of the disease before treatment was approximately the same, over twice as many of the patients treated with pituitrin were well in an average of two and one-half days less time than those treated otherwise. The number of unimproved cases in the series treated with pituitrin was one-half as great as in the other series.

REPORT OF A CASE

V. M., a housewife, aged twenty-six, born in England, entered the Dermatological Department of the Cornell Clinic on March 16, 1931. Eight days previously she had taken setting-up exercises and the next day had painful joints and muscles, as well as burning pain in her right thumb and index finger. In three days, the pain gradually extended across the right hand to the little finger and was followed by small, red spots on the inner side of the palmar surface. These

FIGURE 1

Before treatment. Group of vesicles on inner side of little finger. Deep vesicles on the palm and the ring finger show faintly.

FIGURE 2

After treatment. Remains of vesicles on little finger are just visible. Other lesions have completely disappeared.

spots were painful to touch only. On the fourth day, several painful, red lumps, the size of a lentil, appeared on the outer half of the palmar surface of the right ring finger and on the middle and outer side of the right palm. The lumps persisted and became more painful during the next three days and for this reason the patient came to the clinic for relief. By this time, the discomfort in the joints and muscles and the pain in the thumb and index finger had disappeared.

The patient's family and past history were irrelevant. She had had varicella when six years old and had no knowledge of recent exposure. Her general health was excellent; her teeth were in good condition; and she had no nervous or gastro-intestinal disturbances.

The physical examination was essentially negative except for the local condition. The patient presented several typical vesicles on an erythematous base on the palmar surface of the inner side of the right little finger and the outer side of the right ring finger. Deep, painful, erythematous vesicles were present on the outer side of the right palm. All the lesions were in a roughly linear arrangement (Fig. 1), which corresponded to the distribution of the distal branch of the ulnar nerve. There was no edema or increased local temperature in the hand and no lesions were on the inner side of the palm, arm, wrist, thumb, or first two fingers.

The patient was given 1 c.c. of obstetrical pit-

uitrin intramuscularly, on March 16th, and within two days the pain was much less and the lesions were fading. The above injection was repeated on March 18th and on March 20th. On the latter date the pain had entirely disappeared and the lesions were barely visible (Fig. 2). She was to return for observation in one week but reported that this visit was not necessary as she was entirely well.

This case was of special interest and was described in detail because of the rarity of herpes zoster involving the hand. Montgomery³ stated that "76% of cases of herpes zoster are of the trunk. Zoster attacks of the extremities are rarest of all." In a review of the literature I found only two cases reported. Pernet⁴ reported a case of herpes zoster of three days' duration occurring, two months after a severe attack of measles, in a baby eighteen months of age. The eruption consisted of three characteristic groups of vesicles on the lower part of the flexor surface of the left arm and forearm and many bullae on the left hand and fingers, chiefly on the palm. André and Amyot⁵ presented before the Neurological Society of Paris, a man 45 years of age, who had trophic and sympathetic disturbances in his left arm with loss of muscular power and edema, as well as typical herpes zoster vesicles on the arm, palm, and fingers. The vesicles lasted for two months. One patient in my series of untreated cases had herpes zoster of the arm which extended to the hand, and involved the last two

fingers. I am unable to give further details concerning this case as she did not return after the first visit.

SUMMARY

1. Of the sixteen patients treated with pituitrin, eleven were well in an average of eight and one-half days; two were improved; two were unimproved; and in one the result was unknown. Of the same number of patients treated by other methods, five were well in an average of eleven days; one was improved; four were unimproved; and in six the result was unknown.

2. Herpes zoster is a self-limited disease, but its course is shortened and the severe pain, so often accompanying it, is usually rapidly relieved by pituitrin injections.

3. A case of herpes zoster of the outer side of the palm and two fingers is reported, together with a summary of two similar cases found in the literature and one other seen by the author.

AN UNCLASSIFIED ACUTE ANEMIA WITH RECOVERY *

By NATHAN N. STARK, M.D., and NORMAN STRAUSS, M.D., NEW YORK, N. Y.

WE ARE presenting this case firstly because it falls into no known classification of anemias, secondly because it taxed the diagnostic ingenuity of our entire hospital staff, and thirdly because of the very dramatic recovery.

Case—L. S. Female—aged 16—high school student—was admitted to our hospital on October 21, 1931—she was brought in by ambulance.

Chief Complaint: Weakness, faintness, and fever. Duration: Three days.

Present illness: On October 18, while visiting a museum, patient was suddenly seized with an attack of dizziness and became very faint. She was taken home and put to bed for two days, without showing any improvement. Her temperature during these two days varied be-

tween 102 and 104 degrees. A physician was called, and after examining the patient advised hospitalization. On the day of admission she had a nose bleed. On direct questioning, patient claims that for a few weeks prior to the onset of the present illness she had not been feeling as well as she might have felt. She had been on a "reducing diet" for the past two months and had succeeded in losing sixteen pounds. For the past two months patient has not menstruated.

Past History:

Childhood—Mumps—Poliomyelitis at the age of sixteen months.

Surgical Operations on the right lower extremity at nine and twelve years, respectively for correction of residual paralysis of Poliomyelitis.

Systems:

Gastro-Intestinal—appetite fair. Bowels

* Read before the Clinical Society of the Jewish Memorial Hospital, December 2, 1931.

constipated. Otherwise negative.

Cardiac—negative.

Respiratory—States she is subject to nose bleeds. Otherwise negative.

Genito-urinary—negative.

Menstrual—began at 11½—regular, every 28 days—lasts 5 days. Last period—August 27, 1931. No period since.

Family History: Irrelevant. No history of constitutional diseases, anemias, or bleeders.

Physical Examination: Patient is a pale, pasty-looking adult female who appears apathetic and acutely ill, but does not appear toxic.

Temperature—104.4. Pulse—102. Respiration—28.

Skin is dry—with a greenish icteroid tinge—but no evidence of ecchymosis.

Eyes: Pupils are in mid-dilation—equal, regular, and react to light. The conjunctiva are almost colorless. The scleræ are icteric. The Fundi show recent capillary hemorrhages more marked, however, in the left fundus.

Ears and Nose—negative.

Tongue: was dry—but no glossitis or ulcerations.

Pharynx: slightly injected.

Tonsils: Hypertrophied—but do not appear diseased.

Neck: Negative. Thyroid not palpable.

Lungs: Clear and resonant throughout.

Heart: Negative except for a faint systolic blow at the base. (Hemic?)

Abdomen: Not distended—there was some deep tenderness in the right lower quadrant—but no rigidity or rebound tenderness.

Liver: Not palpable.

Spleen was palpable about 2-3 centimeters below the costal margin; was firm and not tender.

Extremities: Two long operative scars on the right leg.

Reflexes: Diminished but present.

Rectal: Negative.

Vaginal: Showed hymen intact.

Laboratory data on admission:

Blood Count: Hemoglobin 23% (Sahli). Red Blood Cells—1,640,000. White Blood Cells—5,900. Mature neutrophils 55%. Immatures 3%. Lymphocytes—42%. Platelets—240,000.

Smear showed the red blood cells to vary in size and shape (anisocytosis, poikilocytosis) and polychromatic stippling but no normoblasts or megaloblasts. Reticulocyte stain revealed one reticulocyte on the entire slide. Sedimentation time—24 minutes.

Blood Group: 1. (Jansky). Coagulation time—2 minutes.

Urine: Negative for albumin and sugar. Negative microscopically. Negative for urobilinogen.

Stool: Urobilinogen positive. Reaction for blood weakly positive. (Patient had a nose bleed on day of admission.)

Clinical course on the day of admission:

The patient was given a transfusion of 500 c.c. by the Unger method, following which the patient's temperature rose to 105.2. Her hemoglobin and red cell count rose on the following day but then began to steadily fall again. By the fifth day her hemoglobin dropped to 22% and the R.B.C. to 1,200,000 and the patient was in extremis. A second transfusion of 500 c.c. was given. There was an immediate reaction rise in temperature, following which the temperature began to rapidly fall and within three days was down to 99 degrees. Following the second transfusion there was a dramatic change for the better in both the clinical picture of the patient and in her hemoglobin and red cell count. The patient made an uneventful recovery within ten days. The spleen gradually increased in size up to the sixth day—when it was 6-7 cm. below the costal margin—and then began to shrink again.

Subsequent laboratory data:

The temperature, hemoglobin, and red cell count may be seen in Chart I.

The white cell count and differential count may be seen in Table II.

The urine is persistently negative for routine examination and urobilinogen.

The stool was negative after the first day for blood but remained positive for urobilinogen for several days.

Blood Cultures were negative on several occasions.

Widal and Wassermann were negative.

The Platelet Count on Oct. 22 was 240,000—Oct. 27, 245,000—Oct. 31, 280,000—on Nov. 5, 240,000.

The Reticulocyte Count on Oct. 22—one reticulocyte on entire slide. On Oct. 29—2%; Oct. 31—6%.

The Blood Chemistry was non-protein-nitrogen 26.0—Creatinin 1.2 and sugar 80.0.

The Icteric Index (normal 4-6) was 10.0. The Van den Bergh (1-25 normal) was 0.2 and the direct Van den Bergh was negative.

Fragility Test (normal 0.425—0.350) Oct. 31—0.575 to 0.325. Nov. 5—0.6—to 0.375.

Discussion of Case

Because of the sudden onset, the history of two months amenorrhea, and the deep tenderness in the right lower quadrant, the admission diagnosis of a ruptured ectopic pregnancy

was considered most likely. However, this was soon ruled out by the negative sexual history—the intact hymen—the absence of more definite abdominal findings, the negative rectal examination, and the absence of shock. A bleeding duodenal ulcer was considered but was soon discarded because of the absence of a gastro intestinal history and the absence of tarry stools. Having ruled out all surgical possibilities we realized we were confronted with an "Acute Anemia" and the following differential possibilities were considered:

- 1 An acute aplastic anemia
- 2 An acute hemolytic icterus
- 3 An acute febrile anemia of Lederer

1 In the October, 1931 issue of the *Annals of Internal Medicine*, Carey and Taylor outlined the characteristic findings of an aplastic anemia. An aplastic anemia was ruled out in our case for the following reasons:

- a. The absence of hemorrhages into the skin and mucous membrane
- b. The absence of stomatitis or glossitis
- c. The normal white cell count
- d. The normal platelet count (a thrombocytopenia is considered an essential finding of aplastic anemia)
- e. The most important reason of all is the fact that this patient recovered (Aplastic anemia is 100% fatal)

2 Acute Hemolytic Jaundice (Icterus)

An acute hemolytic icterus was seriously considered. In favor of this diagnosis was the age of the patient, the history of onset, the icteric appearance of the patient, the anemia, the gradual increasing size of the spleen, and the most important was the distinct increase in the fragility of the red blood cells (Oct 31—0.575 to 0.325 Nov 5—0.6 to 0.375). Against this diagnosis, however, was the absence of the distinct splenomegaly, (our patient's spleen never increased beyond 6.7 cm below

the costal margin), the absence of any marked increase in the reticulocyte count, and the persistent absence of urobilinogen in the urine (which is a cardinal symptom of an acute crises of hemolytic jaundice).

3 A Hemolytic Anemia of Lederer

In the *American Journal of Medical Sciences*—Oct, 1925, Max Lederer reported three cases and subsequently, in February, 1930, he reported three additional cases of acute hemolytic (infectious?) anemia. The acute onset, the high fever, the severe anemia, and the spontaneous recovery after two transfusions are all points in favor of grouping our case with those of Lederer. There is, however, one very important differential point, namely, the absence of a leucocytosis in our patient. All Lederer's cases presented a distinct leucocytosis ranging from 22,000 to 52,000, while our repeated white counts were within normal limits—or even showed a slight tendency to leucopenia.

Treatment

Aside from the two transfusions this patient received no medication. This is an important point for, had we used iron, liver, ventriculin, or any other drugs, we would have given full credit to specific medication rather than realized the possibility of a spontaneous cure.

Summary

We have here presented a case of profound anemia with an acute onset and with recovery after two transfusions. This case differs from an aplastic anemia because of the absence of leucopenia, thrombocytopenia, and death, and differs from hemolytic icterus because of the absence of a reticulocytosis, splenomegaly and urobilinuria, and differs from an acute hemolytic anemia of Lederer because of the absence of leucocytosis.

This case, therefore, remains unclassified.

EFFECT OF PREGNANCY UPON SUGAR TOLERANCE OF DIABETICS*

By WILLIAM S. COLLENS, M.D., and I. EDWIN SHACK, M.D., BROOKLYN, N.Y.

MANY reports have appeared in the past few years on the study of the sugar tolerance of pregnant diabetic women. A review of this literature reveals a marked difference of opinion on the influence of pregnancy upon the diabetic tolerance. Lawrence¹ maintains that there is an improvement in the carbohydrate tolerance during the latter months of pregnancy. An analysis of his case report, however, does not necessarily prove his point. He shows that the patient was maintained on five to fifteen units of insulin per day before pregnancy, while it was necessary to give the patient forty-four units of insulin a day in the latter months on approximately the same diet. In addition, however, he observed that the patient regularly excreted ketone substances (one gram a day in the latter months). Stander and Peckham² also think that diabetes improves during the latter half of pregnancy. It is difficult from the study of their case reports to draw such conclusion, since the diabetic data seems incomplete. Parsons, Randall and Wilder³ present two cases in which they confirm these observations. These authors explain this supposed improvement in sugar tolerance on the theory that the fetal pancreas is capable of furnishing an additional increment of insulin to increase the mother's carbohydrate tolerance. They find support in their view from the experimental studies of Carlson and Drennan⁴ who were unable to produce experimental diabetes in pregnant bitches until the uterine contents were delivered. They find further support of their view in histological studies of the islands of Langerhans from fetuses of both diabetic mothers and experimentally produced diabetic dogs. There seems to be evidence of hypertrophy and hyperplasia of these islands. Other observers have found a decrease in carbohydrate tolerance in the latter period of pregnancy. Wiener⁵ presents a case of a young diabetic woman whose tolerance became progressively worse as pregnancy advanced. Lambie,⁶ in an article containing a very exhaustive review of the literature, presents one case with a similar course. Bowen⁷ shows a diminished tolerance in three pregnant diabetic women as these patients approached term. Experimental studies of Allen⁸ reveal no influence of the fetus upon the tolerance of partially pancreatectomized dogs. He believes the contrary results of Carlson and Drennan to be due to the marked cachexia that follows removal of the pancreas in dogs.

This confusion in the literature exists because of the lack of sufficient criteria for the determination of the sugar tolerance in the diabetic state. The present method for establishing a patient's

tolerance consists in determining the degree of glycosuria on a stated test diet, the degree of acidosis, the height of blood sugar content during fasting in the postabsorptive period, and the nature of the blood sugar response to the oral administration of a definite amount of carbohydrate. On the basis of this difficulty, Collens and Grayzel⁹ devised a clinical method for establishing diabetic tolerance which was found to be a singularly successful criterion and apparently superior to methods previously described. When a patient ingests a stated amount of available dextrose in the diet and excretes a definite amount of dextrose in the urine, then the difference between the two figures represents the amount consumed, whether oxidized or stored. This is a measure of the patient's ability to utilize sugar. When, however, the patient requires a certain amount of insulin to aid in the utilization of the sugar, a more accurate index of the patient's tolerance would seem to be established by determining the ratio of the dextrose utilized to the amount of insulin administered. This ratio they designated the dextrose-insulin quotient. Thus, if a patient utilized one hundred and fifty grams of dextrose with the aid of the ten units of insulin a day, it becomes apparent that this tolerance is far greater than that of a patient who utilizes the same amount of dextrose with the aid of fifty units of insulin. This can be seen more clearly from the dextrose-insulin quotient, which is an arbitrary figure and a more concise index. Thus, in the former case, the dextrose-insulin quotient is fifteen, while in the latter case it is three. This figure does not necessarily indicate the dextrose equivalent of one unit of insulin, but it does represent the degree of assistance that the patient needs from exogenous insulin.

We employed this method of establishing the sugar tolerance of the two diabetic women whom we studied for approximately one year prior to pregnancy and observed frequently through gestation and the postpartum period. This study disclosed clear evidence of the fact that these two patients developed a progressively diminishing sugar tolerance as pregnancy advanced up to the time of delivery.

Case 1. T. K., age 24, was admitted to the hospital on February 9, 1928, with the following history: Seven months prior to admission she was delivered of a normal baby. Three months later, during her lactating period, i.e., four months before admission, she complained of marked weakness. This symptom became progressively worse and she began to lose weight. Two months before admission, she began to complain of polydipsia, polyuria, and polyphagia. Examination revealed all the clinical and chemical evidence of diabetes mellitus. There was no family history

*Read before East New York Medical Society, Brooklyn, N. Y.

of diabetes or any other metabolic disorder. Her past history disclosed attacks of measles, whooping cough, and mumps in childhood. In 1918 she had influenza with a complicating purulent left otitis media. She has had frequent colds and attacks of tonsillitis since that time. She was married three and one-half years, and delivered a normal full term child seven months before admission. There were no miscarriages, abortions or stillbirths. She began to menstruate at thirteen, regularly every twenty-six days, and with a seven day habit. She has not menstruated since the conception of the recent pregnancy.

On admission, examination revealed a white female of slight build, with otherwise negative physical findings. Urine on admission contained two percent sugar, and four plus acetone and diacetic acid. The fasting blood contained 300 mgms percent of sugar. The CO_2 combining power of plasma was thirty-eight and one-tenth volumes percent. The patient was given a diet containing carbohydrate 70 grams, protein 50 grams, fat 120 grams, and 40 units of insulin a day in divided doses. Under this therapy she was rapidly desugarized and ketosis was immediately controlled. She was discharged from the hospital in eleven days and subsequently followed as an ambulant patient. Her further course is seen in Table 1. She was followed for nine months during which time she was kept on a maintenance diet of approximately twenty-six hundred calories and an average of 175 to 200 grams of available glucose. She required between twenty-five and thirty-five units of insulin a day to maintain her in a normal physiological state. She was almost constantly sugar-free. It will be noted that her glucose insulin quotient ranged between 5.7 and 6.0. Menstruation returned in December, 1928, and continued regularly as to type and habit until April 22, 1929, after which she became pregnant. Her subsequent diabetic tolerance is also seen in Table 1. It will be noted that her available glucose intake remained relatively constant during her entire pregnancy. Although we found it necessary to increase her insulin first to 50 units a day, and in her later months to 65 units a day, her urinary excretion continued to mount. At the same time she showed the presence of acetone bodies in her urine on fairly frequent occasions. Her glucose-insulin quotient definitely dropped so that it ranged between 3.0 and 3.6. On January 8, 1930, she was admitted to the hospital in labor and delivered a normal male child weighing nine pounds eleven ounces. The blood was uncomplicated. She was given a diet of carbohydrate 150 grams, protein 60 grams and fat 100 grams, available glucose 196 grams and 60 units of insulin a day in divided doses. The patient was sugar-free for the first three days after delivery and then she experienced a severe attack of hypoglycemia. It was necessary to administer 400 cc

of ten percent dextrose intravenously in addition to a glass of orange juice. The following day she received no insulin and she excreted 0.2% sugar in the urine. Her tolerance was again diminished and it was necessary in the next ten days to increase her insulin to seventy-five units a day in order to control the urinary excretion of sugar. She was discharged from the hospital three weeks after admission on the same diet with an available glucose intake of 196 grams and

forty-five units of insulin a day, with her urine free from sugar. Eleven days postpartum her blood sugar rose to 500 milligrams. She has been followed for ten months since delivery. It will be observed that she now requires more insulin than before pregnancy and that her glucose-insulin quotient is between 4.2 and 4.7. It appears quite obvious that the experience of pregnancy has definitely reduced this patient's tolerance.

Case 2. S. G., twenty-seven years old, was first seen June 14, 1929, with a history of diabetes mellitus of one and a half year's duration. Onset occurred with classical clinical symptoms of polydipsia, polyuria, polyphagia, weakness and weight loss. Her mother and one sister died of diabetes. Her menstrual history began at fifteen, established itself with regularity, recurring every thirty days, and lasting three days. The patient was married two and one-half years, and had one pregnancy which resulted in a spontaneously delivered stillbirth six months previously. Thus it is estimated that she conceived three months after she became diabetic. There is no record as to the type of treatment she received during that pregnancy. At the time she came under our care she presented the picture of a well-nourished young individual, with no abnormal physical findings except a slight diffuse thyroid enlargement of the adolescent type. She was then spilling thirteen grams of sugar in her urine, and there was no evidence of ketosis. The fasting blood sugar was 200 milligrams percent. She was maintained on a diet containing an average caloric value of 2,400 calories. Her available glucose intake ranged between 200 and 250 grams. She was easily controlled with fifteen to twenty units of insulin daily, and her glucose-insulin quotient ranged between 12.1 and 14.2. (See Table 2.) The patient felt well, and gained eleven pounds in three months. On January 20, 1930, the patient menstruated the usual three days, following which she conceived. The patient was not seen again until July 29, 1930, when she was in the sixth month of gestation. She was then taking thirty units of insulin a day on the same diet as given prior to pregnancy, and she excreted five percent sugar which represented 100 grams. Her fasting blood sugar had risen to 304 mgms. percent. Her actual glucose consumption had dropped approximately 100 grams, in spite of increased insulin dosage. Her glucose-insulin quotient fell from an average of 12.9 before pregnancy to 5.3. Her insulin dose was increased to forty units a day in divided doses, and her diet was maintained at a constant level. By the eighth month it was necessary to give her fifty units a day and yet her quotient continued to drop progressively to 3.3. By the beginning of the ninth month it was necessary to administer sixty-five units of insulin a day, and her quotient dropped to 2.7. On October 28, 1930, after a short labor she delivered a normal male

child weighing eight pounds, four ounces. Immediately after the delivery the patient was given 1,000 c.c. of five percent dextrose in saline by clysis. At the same time she was given twenty units of insulin. She spilled one percent sugar in the urine after the dextrose administration. The following day the patient was placed on a diet containing carbohydrate 225 grams, protein 50 grams, and fat 100 grams. The caloric value was 2,000 and the available glucose was 265. She was given twenty-five units of insulin three times a day with this diet, as a result of which the patient became sugar-free. That afternoon she experienced a hypoglycemic attack from which she was relieved by fifty grams of glucose in the form of orange juice. Her insulin was then cut down to twenty units twice a day, making a total of forty units a day. Her fasting blood sugar was then 57 mgms. percent. Insulin was then stopped completely and although on the same diet she remained sugar-free, the blood sugar, sixteen hours after the last dose of insulin, was 58 mgms. percent. The patient remained sugar-free for three more days, during which time she was given no insulin at all, and the available glucose intake in her diet was kept at 240 grams. On the sixth day postpartum she spilled 13.8 grams of sugar in the urine and it was necessary to give her thirty units of insulin a day. Her fasting blood sugar had risen to 149 mgms. percent, and the glucose-insulin quotient was 7.6; i.e., an obvious increase in tolerance as compared with the latter half of gestation. She was seen again two months after delivery at which time

she was receiving 343 grams of available glucose in her diet and thirty-five units of insulin a day. She spilled 28.5 grams. Her fasting blood sugar rose to 244 mgms. percent, and her glucose-insulin quotient was 9.8. Although her tolerance was much better than during pregnancy it was lower than the pre-pregnant level. This again illustrates that pregnancy has definitely lowered the sugar tolerance.

DISCUSSION

Our study of these two patients indicates that diabetic tolerance for sugar becomes progressively diminished with advancing pregnancy. Although in both cases the same diet was maintained during pregnancy as during the long period preceding pregnancy, the insulin requirement in case 1 was doubled and in case 2 was tripled. In spite of these large increases in insulin dosage, the total urinary excretion of sugar could not be maintained at the pre-pregnant level. The fasting blood sugars were definitely higher during the latter months of pregnancy. The glucose-insulin quotient became steadily lower so that close to term these patients behaved very much like total diabetics. We cannot, on the basis of these observations, reconcile ourselves to the conception of some observers that the diabetic state improves with the advancement of pregnancy. Their explanation that there is an additional increment of fetal insulin which improves the deranged maternal carbohydrate metabolic function is based upon the fact that the pancreas of a fetus born by a diabetic mother shows hypertrophy and hyperplasia of the Islands of Langerhans. That there is hypertrophy and hyperplasia of these islands is a well known fact, but we believe that this phenomenon can be differently interpreted. As a result of his studies, Staub¹⁰ believes that the insulin content of the blood is not maintained at a constant level, but is increased following a carbohydrate intake and is depressed during hunger. Our own recent unpublished experiments appear to confirm the observations of Staub that a plethora of glucose in the blood stimulates insulin function. It seems likely on the basis of these observations, that the high glucose concentration of the fetal blood, maintained as it is by its constant supply of maternal blood, has a stimulating effect on the islands of the fetal pancreas. It is reasonable to assume that the constant stimulation of the islands by a persistent hyperglycemia results in the hyperplastic picture. The experimental studies of Carlson and Drennan which show that diabetes does not develop in a pregnant pancreatectomized dog until the uterine contents have been emptied, would lead one to suspect that fetal insulin plays a large part in maintaining the maternal carbohydrate metabolism while functioning in utero. Carlson himself concludes

from these studies that experimental diabetes in the dog, produced by the removal of the pancreas is fundamentally not the same as the human metabolic derangement. There is sufficient evidence to corroborate this opinion in the observations of Baker, Dodds and Dickens,¹¹ and Best, Smith and Scott,¹² who showed that the blood and tissues of patients dying in diabetic coma contained almost a normal amount of insulin. This would seem to indicate that human diabetes does not result from the absence of insulin as occurs in pancreatectomized dogs, but from an ineffectiveness of insulin. If it were true that the human fetal pancreas is capable of supplementing the deranged function of maternal insulin, then we would expect our patients to show marked improvement in tolerance. That, however, was not the case.

A very striking episode in the life history of our patients occurred during the puerperium. We have observed in both cases that shortly following the delivery of the child the carbohydrate tolerance showed evidence of remarkable improvement. In Case 1, it will be recalled that the patient experienced a severe attack of hypoglycemia, and it was necessary to stop the insulin for a day. In Case 2, it was necessary to stop the insulin for three days, during which time the patient's urine was sugar-free, and the blood sugar levels were abnormally low. It is fair to conclude that during this period these patients were truly non-diabetic. After this period the tolerance again broke, and it was necessary to resume insulin therapy. This observation is not new with us, for it was observed by Lawrence, by Parsons, Randall and Wilder, by Lambie, and by Bowen. Surely, as Macleod¹³ feels, fetal insulin could hardly explain this improvement in tolerance. Macleod, however, maintains that this phenomenon is the result of the diversion of blood sugar to lactose in the breasts. If that were the case, one would expect that the improved diabetic tolerance would continue through the entire lactating period. Unfortunately, this improved state does not continue—it is only transitory. It is interesting to mention at this point that case 1 developed her diabetes in the third month of her lactating period of the previous gestation. We feel that there is another fundamental mechanism responsible for this remarkable, though transitory, disappearance of the diabetic state.

There appears adequate evidence in the literature that the pregnant state is associated with alterations of function in several glands of internal secretion. Erdheim and Stumme¹⁴ observed structural changes in the anterior pituitary lobe due to the proliferation of pregnancy cells which disappear almost entirely after pregnancy. The Aschheim-Zondek¹⁵ test for pregnancy depends upon the presence of anterior pituitary substance and represents a hyperfunction of the pituitary

body. Marek¹⁶ has pointed out the frequent development of acromegalic features during the later months of pregnancy and which are commonly noted to disappear during the puerperium. Löhlein¹⁷ showed that eighty percent of women approaching term have a narrowing of the lateral visual fields due to pressure on the optic chiasm. This finding disappears within ten days after delivery. It is reasonable to expect, therefore, on the basis of these observations, that pregnancy is attended with not only an anatomical enlargement but also a hyperfunction of the anterior pituitary body, and that during the puerperium there is a very rapid involution in hypophyseal function. Another gland that is commonly found to be hyperplastic during pregnancy is the thyroid. It is only necessary to mention that there occur numerous changes in the ovary during pregnancy. Goldzieher¹⁸ states that there is a marked hypertrophy of the adrenal cortex during pregnancy. This hypertrophy begins in the fasciculate zone and later appears in the reticular zone. That hyperfunction of these glands has an inactivating influence on insulin has frequently been experimentally demonstrated.¹⁹ The termination of pregnancy occasions the removal of the factor or factors responsible for the excitation of these glands. It is our feeling that the change in the function of these glands brings the diabetic to her pre-pregnant level, and that the temporary improvement after delivery represents a sudden change in the endocrine balance during which time a normal physiological state in carbohydrate utilization occurs.

A very important question that confronts the average physician in the case of diabetic women is whether she should be permitted to bear children. This problem, before the days of insulin, was easily answered. In part, nature provided for this contingency. In the first place, diabetics without insulin therapy frequently did not menstruate or were sterile, thus preventing the possibility of conception. On the other hand, conception having occurred, pregnancy usually terminated spontaneously between the sixth and eighth month, in one-third of those cases. Of those who were successful in carrying to term, fifty percent delivered stillbirths, and eighty percent of those children born alive succumbed in the first few days after birth. Furthermore, the mortality rate among the mothers has been estimated by various authors to be between twenty-five and fifty percent. Such a severe mortality rate resulted from the operative obstetric procedures necessitated by abnormally large fetuses, the increased susceptibility to infection in diabetics, and the frequency of diabetic acidosis and coma. Such unsatisfactory experiences naturally compelled the physician to strongly advise against conception in diabetic women, and if pregnancy occurred, to immediately encourage artificial ter-

mination. The present status of diabetic management has entirely changed this picture. The proper management of diabetes with insulin can effectively produce a practically normal physiological state. We can, therefore, say that there exists no other contraindication to pregnancy in the diabetic than can exist in the non-diabetic woman. In other words, a woman suffering from diabetes should be capable of going to term just as anybody else, provided that she at all times receives the treatment which corrects her deranged carbohydrate metabolism. The fact that we were able to demonstrate that the diabetic tolerance becomes worse as pregnancy advances, merely means that these patients must receive increased doses of insulin in their latter months in order to maintain them in a normal physiological state. This, in itself, does not appear to us to be a contraindication to pregnancy, for under such circumstances a diabetic if treated, can be clinically considered a non-diabetic. This conception calls for a close cooperation between the internist and the obstetrician in the management of the diabetic during pregnancy. There are only two considerations that need be mentioned as arguments against the encouragement of conception in diabetic women. The first, is the fact that the experience of pregnancy permanently reduces the subject's subsequent glucose tolerance. The second, is the consideration that diabetes is a familial disease and that children born of diabetic parents are stamped with the stigma of susceptibility to diabetes at some time in later life. This does not mean that the children are susceptible to the juvenile form of diabetes for only one-half of juvenile diabetics give a family history of the disease. We believe that a diabetic woman seeking information regarding the advisability of pregnancy need only be apprised of these three important facts; 1—that she subjects herself to a possible subsequent increase in the severity of her disease; 2—that diabetes is a familial disease, and 3—that it is of utmost importance that her diabetic state be carefully and intelligently managed during the period of pregnancy.

CONCLUSIONS

1. The glucose tolerance of a pregnant diabetic woman becomes progressively diminished with advancing pregnancy.
2. There occurs in the first few days of the puerperium a transitory period during which the sugar tolerance increases to such an extent that the patient can be considered non-diabetic. This period, in our experience, lasts only from one to three days.
3. The experience of pregnancy seems to permanently reduce the sugar tolerance of a diabetic.
4. Diabetes is no contraindication to pregnancy, per se, for under modern methods of manage-

ment, no complications occur which are intrinsically the result of the diabetic state

TRENDS IN CHILDHOOD MORTALITY IN NEW YORK STATE (EXCLUSIVE OF NEW YORK CITY)

By ELIZABETH PARKHURST, A B, ALBANY, N Y

From the Division of Vital Statistics New York State Department of Health Read before the Vital Statistics Section of the American Public Health Association at the Sixtieth Annual Meeting at Montreal on September 17 1931

THE remarkable decrease in the infant mortality in the brief space of a score of years is among the comparatively few events in organized public health work where well planned and intelligently directed methods of prevention have brought the wished for results Comparatively little attention has been given the immediately adjacent ages, one, two, three and four years, but here, too, there has been an improvement of outstanding degree The following table shows in brief what has happened in the original Birth Registration Area

	Deaths		Rates*	
	1915	1928	1915	1928
Under 1 year	77,572	48,878	99.9	66.7
1-4 Years	26,848	17,397	10.4	5.5

The infant mortality rate in 1928 was 33 per cent below the rate in 1915, while the drop in the rate of the 1-4 year group was considerably greater—47 per cent

The purpose of this paper is to analyze the trends of the total mortality and mortality from specified important causes among children of pre-school age (one to four years inclusive) during the thirty year period 1901-1930 in the territory under the jurisdiction of the New York State Department of Health—i.e., the State, exclusive of

New York City The mortality data for 1915-1931 are taken from the annual reports of the State Department of Health The figures for 1901-1914 are taken from the U S Mortality Reports, because the state tabulations according to age are not available for those years

Estimates of Population 1-4 years of Age The mortality rate at single years of life under 5 years, with the exception of infant mortality, which is based on the number of recorded births, has always been difficult to measure The federal census is taken once in ten years, and the farther removed from a census year, the more likely are the estimates of population to be erroneous This is particularly true of the ages under 5 years, since it is generally agreed that even the census count is below the actual number of children living Besides, inter- and post-censal estimates do not allow for fluctuations in the birth and death rates that affect the population at these early ages

In this paper we shall therefore, employ estimates of the population based upon the recorded births and deaths The method used is similar to that employed by Glover in the life tables of 1909-1911 to estimate the true number of births when birth registration was incomplete For the years 1901-1917 it was necessary to correct the recorded number of births for incompleteness of reporting This was done by assuming that the gen-

* Infant mortality per 1 000 live births other rates per 1 000 population

eral trend of the birth rate in Massachusetts, a state where registration has been practically complete for many years, was the same as the birth rate in New York State, exclusive of New York City.* For the years 1905-1910 these estimates were checked by computing the births from the populations at 2, 3, and 4 years of age (these being more completely enumerated than the populations under 2) as given in the census of 1910 and as estimated for 1909 and 1911. In all cases the difference between the two estimates was found to be less than 3 per cent.

The populations thus computed relate only to the native-born; the number of foreign-born under 5 years is, however, negligible. The chief source of error is the migration to and from New York City and other states. The rapid development of the suburbs of New York City in the last few years, particularly in Nassau and Westchester counties, has undoubtedly brought into the Upstate territory a considerable number of children whose births were recorded in New York City; our estimates are, therefore, probably below the actual numbers. In the census year, 1910, for example, the population 1-4 years estimated from births and deaths was 4.9 per cent more than the census count, and in 1920 1.3 per cent more, whereas in 1930 the estimated number was 2.4 per cent less than the census figure, although for the state as a whole it was 3 per cent more.

The Trend of Mortality, 1-4 Years of Age. In New York State mortality in early childhood began to decline after 1910. The average rate in the five year period 1926-1930, 5.1 per 1,000 population, was 55 per cent lower than the annual average in 1901-1910 (11.3). The principal cause of death since 1901 has been pneumonia, with the exception of the years 1905 to 1908, 1913 and 1921, when there were more deaths from diarrhea and enteritis, and 1918, when there were more deaths from influenza. From 1901 to 1923, with the exception of these seven years, and the year 1919 (when diphtheria took second place), diarrhea and enteritis was second in importance. Since 1926, accidents has been the second most important cause and diarrhea and enteritis third. In 1901-1910 pneumonia was responsible for 17.2 per cent of all deaths, diarrhea and enteritis 17.5 per cent, diphtheria 10.5 per cent, the other communicable diseases (measles, scarlet fever and whooping cough) 12.9 per cent, and accidents 6.1 per cent. In the quinquennium 1926-1930 the picture was quite different, pneumonia causing 21.3 per cent of all deaths, accidents 13.7 per cent, diarrhea and enteritis 10.8 per cent, diphtheria but 5.4 per cent, and the other communicable diseases 10.6 per cent.

Mortality at One Year of Age. The death

rate in the second year of life, though but a fraction of the infant mortality rate, is twice as high as the death rate in the third year, and higher still than the rates in the fourth and fifth years. It is at this age that the greatest decline in mortality has occurred. The annual average death rate in 1926-1930, 9.2 per 1,000 population, was 58.4 per cent below the average in 1901-1910 (22.1). The annual average per cent of decline in the rate from 1910 to 1930 was 4.9, while for infant mortality it was 3.2.

Diarrhea and enteritis was the leading cause of death from 1901 through 1915. Beginning with 1916, with the exception of the years 1918 (when influenza was first) and 1921 (when diarrhea was first), pneumonia was in first place and diarrhea and enteritis second. These two causes are responsible for more than 40 per cent of all deaths at this age, and this percentage has not changed materially since 1900.

Accidents, the third most important cause in 1926-1930, was of considerably smaller relative importance in 1901-1910, being preceded by bronchitis, tuberculosis, meningitis, measles, whooping cough, and diphtheria. The last three diseases and scarlet fever were responsible in 1926-1930 for the same proportion of all deaths as in 1901-1910—16 per cent. The death rate from measles dropped 53 per cent and from whooping cough 36 per cent, while the death rates from scarlet fever and diphtheria declined 78 per cent. The decline in mortality from measles and whooping cough has been less at one year than at the succeeding ages.

Mortality at Two Years of Age. The annual average death rate at two years of age in 1926-1930, 4.8 per 1,000 population, was 54 per cent below the average in 1901-1910 (10.4). The annual average per cent decline in the rate from 1910-1930 was 4.3. Pneumonia was the principal cause of death throughout this period, except 1918 (influenza first) and 1924 (accidents first). In 1901-1910, with an annual average rate of 174.8 per 100,000 population, it was responsible for 17 per cent of all deaths; in 1926-1930, with a rate of 96.3, for 20 per cent. Since 1922 (with the exception of 1924) accidents has been the second most important cause, followed in 1922 by diphtheria and from 1923 to 1930, by diarrhea and enteritis.

In the period 1901-1910, diphtheria, with a rate of 129.9 per 100,000 population was second in importance to pneumonia, and diarrhea and enteritis, with a rate of 121.2, third. In 1926-1930 the death rate from diphtheria was only 29.7, and was exceeded by the death rates from accidents (63.3), diarrhea and enteritis (48.1) and tuberculosis (33.4). Compared with the rate in 1901-1910, the diphtheria rate dropped 77 per cent, while the rate from scarlet fever dropped 82 per cent, from measles 69 per cent, from whooping

* For a discussion of this and other methods see "Correction of Birth Rates for Incomplete Reporting" by A. W. Hedrich, American Journal of Hygiene, Sept., 1929.

cough 57 per cent, from tuberculosis 40 per cent, from diarrhea and enteritis 60 per cent, and from pneumonia 45 per cent. The decline in the death rates of the four common communicable diseases, tuberculosis, and meningitis accounts for 55 per cent of the reduction in the death rate from all causes. In 1901-1910 they were responsible for 41 per cent of all deaths, in 1926-1930, for 25 per cent.

Mortality at Three Years of Age. The annual average death rate at three years of age in 1926-1930, 3.5 per 1,000 population, was 49 per cent below the average in 1901-1910 (6.8). The annual average per cent decline in the rate from 1910 to 1930 was 3.6 per cent. The decline in the death rates from measles, scarlet fever, whooping cough, diphtheria, tuberculosis and meningitis accounts for 72 per cent of this difference. In the decade 1901-1910 this group of causes was responsible for 47.8 per cent of all deaths, while in 1926-1930 the proportion was only 25.2. From 1901 to 1907 diphtheria was the leading cause of death with pneumonia second. From 1908 to 1922, with the exception of 1918, diphtheria was the leading cause in seven years and pneumonia in seven. From 1923 to 1930 accidents was the most important cause of death, followed by diphtheria in 1923, 1924 and 1927, and by pneumonia in the remaining years.

The death rate from diphtheria in 1926-1930 was 76 per cent below the rate in 1901-1910. In the same period the death rate from measles has dropped 64 per cent, from scarlet fever 82 per cent, and from whooping cough 59 per cent. Pneumonia has dropped 45 per cent and diarrhea 44 per cent, while the death rate from accidents was 19 per cent above the rate in the earlier period.

Mortality at Four Years of Age. The annual average death rate at four years of age in 1926-1930, 2.9 per 1,000 population, was 48 per cent below the average in 1901-1910 (5.2). The annual average per cent decline in the rate from 1910-1930 was 2.9. Diphtheria was the principal cause of death from 1901-1912, 1914, and again in 1920 and 1921. In 1913 the death rate from pneumonia equalled that from diphtheria, and in 1915 it was greater. Since 1916, with the exception of 1918, 1920 and 1921, accidental deaths were in first place. In 1926-1930 the death rate from accidents was greater by almost 50 per cent than in 1901-1910, and was greater than the sum of the pneumonia and diphtheria rates.

The decline in the death rates from measles, scarlet fever and whooping cough has also been marked. Together with diphtheria, tuberculosis and meningitis they account for 77 per cent of the drop in the total death rate.

Movement of Mortality at 1-4 Years of Age from Specified Causes. The mortality from diarrhea and enteritis has been declining steadily

since 1910. The reduction has been greatest at one year of age, the rate dropping on an average of 8 per cent each year as compared with 5.6 per cent at two years, 4.4 per cent at 3 years, and 4.5 per cent at 4 years. In the decade 1901-1910 diarrhea and enteritis was responsible for 26 per cent of all deaths at one year, 12 per cent at 2 years, 7 per cent at 3 years, and 5 per cent at 4 years. In 1926-1930 these percentages were 14, 10, 8 and 5.

In 1926-1930, pneumonia was the leading cause of death at one and two years; at 3 and 4 years it was second, accidents being first. Before 1918, there was no discernible trend in the death rates from pneumonia. In the last twelve years, however, the mortality has moved downward at all ages. The decline was less than in the death rate from all causes so that at present, at each age except 4 years, pneumonia forms a larger percentage of the total mortality than it did in 1901-1910.

The death rate from accidents at one and two years has declined since 1915. Fatal accidents at these ages are mostly burns, poisonings and falls. At 3 and 4 years automobile accidents form a larger part of accidental deaths, and the total death rate has declined only in the last five years and then but slightly. Now accidents is the principal cause of death at 3 and 4 years, and is second to pneumonia at 2 years. At one year it is preceded by both pneumonia and diarrhea and enteritis.

Mortality from measles has declined only in the last ten years. At 1-4 years the annual average death rate in 1926-1930 was 42 per cent below the rate for 1921-1925 which in turn was 33 per cent below the rate in the preceding quinquennium.

Mortality from whooping cough has also declined only in the last 10 years; the reduction has been less at one year than at any other age.

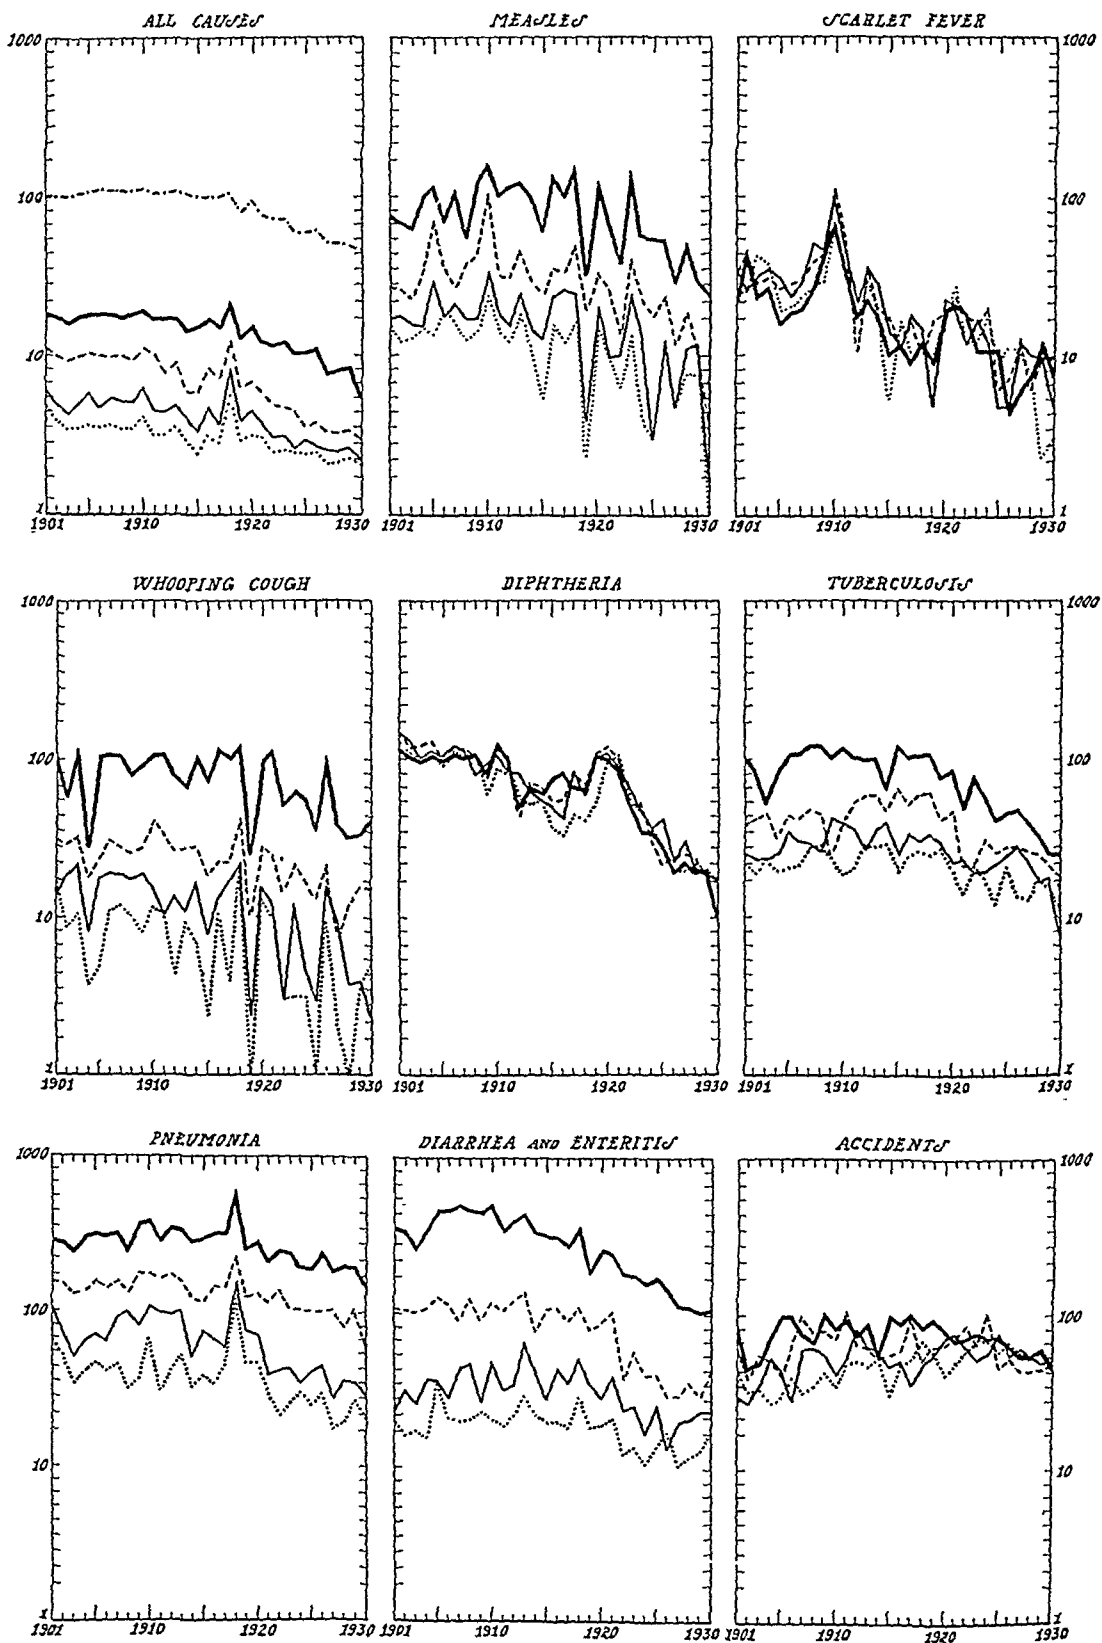

The death rate from scarlet fever has dropped relatively more than that from any other cause. The curve of mortality in 1901-1930 shows two cycles, but the peak of the first cycle in 1910 was 3 times as high as the peak of the second, in 1921, while the low point of the second is much below that of the first. The death rates at 1, 2, 3 and 4 years are very nearly the same, and the movement of the rates has been similar. Since 1901 the rate at 1-4 years has declined on an average of 5.5 per cent a year.

Mortality from diphtheria has also been declining since the beginning of the century, except for a rise between 1915 and 1920, which was followed by an even more rapid decline. For the whole period the rate has dropped on an average of 4.3 per cent a year. From being the most important cause of death at 3 and 4 years it has become third in 1926-1930.

Tuberculosis mortality at the early ages con-

* The rates in this column are based upon the estimated populations under one year, not upon living births.

sists largely of deaths from tuberculous meningitis. The death rate from this cause rose considerably from 1900 to 1915, probably due to better diagnosis, or to the supplemental inquiries of certificates giving "meningitis" as a cause of death. Since 1915 the decline has been marked. At 1-4 years the death rate from tuberculosis,

all forms, in 1926-1930 was 24 per cent below the rate for 1921-1925, which in turn was 36 per cent below the rate for 1916-1920.

The decline in the death rate from meningitis, which was among the leading causes of death at the beginning of the century, is undoubtedly due in part at least to better diagnosis and to the greater care given by physicians to the certification of the cause of death. The death rate from congenital malformations, while very small after the first year of life, shows an increase paralleling the rise in the infant mortality from this cause.

The mortality from appendicitis and cancer, though of little numerical importance among young children, has been rising in the last 15 years; here, too, probably better diagnosis is very likely the main factor.

The death rate from diseases of the heart also increased up to 1920, but since then there was a gradual drop, so that the 1926-1930 rate was 37 per cent below that for 1921-1925.

Conclusion. It is doubtless a fact that while there has been an increase in public health activities among children of all ages, those in the preschool group are not receiving, relatively, as much care and attention as the infants under one and the children of school age. In the words of Dr. A. J. McLaughlin, Medical Director, United States Public Health Service, "The greatest single defect in our public health work today is our inability to secure early immunization and early discovery and correction of defects in children from 1 to 5 years old . . . generally speaking, this field is almost untilled."*

The thorough application of present medical and public health knowledge should make possible a further reduction, if not the practical elimination, of diphtheria and diarrhea. In the matter of pneumonia the situation is less fortunate, but a more intensive effort against all the diseases of children over one and under five years should result in a lowered mortality from pneumonia as well.

HEARING SURVEY, PUBLIC SCHOOLS, ALBANY, N. Y.

By E MARTIN FREUND, M D, ALBANY, N Y

DURING the years of 1930 and 1931 a survey was undertaken of the hearing of the public school children in Albany. This study was commenced in May, 1930, and was continued that fall until June, 1931. These tests were done on all pupils in and above the third grades, also in the Junior and Senior High Schools. It was considered impracticable to examine those of the kindergarten and the first two grades as it was felt that these three groups could not cooperate sufficiently with the devices used.

The total school attendance for the entire Public School system, including the Part-Time Junior and Senior High Schools was 14,361 pupils. The census of the Part-Time High School, Kindergartens, and the first and second grades, comprising the groups not tested, was 4,041, or nearly 33 per cent of the total school population.

It is pertinent here to note that the total Albany school population, i.e., children below 18 years of age, was approximately 21,000, the remaining 7,000 being pupils attending the various parochial schools, private academies and business schools.

With the aid of the phono audiometer, type 4-A (Westinghouse) it was possible to test a group of 40 children at one time. This apparatus consists of a phonograph and records which "speak" numbers in 2- or 3-digit groups to each child by means of individual head phones that are connected to the phonograph by 5 trays, serially wired in groups of 8 head sets to each tray. In this manner the pitch and intensity of the spoken numbers do not vary in any of the 40 head sets. The records, as previously stated, transmit spoken numbers, the speaker's voice growing quieter and quieter as the succeeding numbers are uttered. Twelve groups of numbers are dictated in each column so that the spoken voice commences in an ordinary loud conversational tone and ends in a very low whisper. Each ear receives a 4-column test, 2 giving the voice of a woman and 2 that of a man. Thus the pupil is tested for pitch as well as sensation unit loss. The average time consumed in testing a group of 40 children is 20 minutes. Each pupil being thus tested writes the number he hears in the proper column and the most correct column of each ear test is judged as the final result.

In each case also the pupil fills out a Standard Record Sheet including such facts as name, age, grade, sex, history of previous or present earaches, ear discharges and head noises, and designates which ear or ears are or have been so affected. In this anamnesis the school nurse and grade teacher are of considerable assistance, especially with the younger children. Information regarding previous tonsil inflammation or operation and

mastoid operation is also noted on the sheets.

In this survey the routine was as follows: first the 4-A test was given to all the children in groups of 40 or less, those of the 3rd and 4th grades receiving the 2-digit tests while the 5th and higher grades received the 3-digit tests. The sheets were then corrected and those children showing a loss of 9 or more sensation units were reexamined several days later with the 4-A. Those showing similar defects in the retest were finally tested individually with the 2-A audiometer (Westinghouse). This latter is an electric device which gives the exact percentage of loss of hearing analogous to calibrated tuning forks ranging from 64 to 8192 vibrations. This apparatus has certain advantages over tuning forks in that the intensity of sound is constant, it is time saving and it does not depend upon the interpretation of the person conducting the test.

All the pupils tested with the 2-A were given a routine ear, nose and throat examination for the purpose of noting any existing pathology that might in any way have some bearing upon the existing diminution of hearing. The 2-A tests and the otolaryngological examinations were all done by the otologist, thus insuring uniformity of routine.

TABLE I

TABLE 2

Totals and Explanation of Fig. 1.

Total number of pupils tested with 4-A.....	9741
Total number retested with 4-A	2373
Total number tested with 2-A	747
Total defective hearing with 2-A	339
Total borderline defects with 2-A	168

It is to be noted that out of 9,741 pupils tested with the 4-A, 2,373 or 25% required retesting. The reasons for this large percentage of failures are numerous. One must take into consideration the child's nervousness, inattention, apprehension, and distraction; also extraneous noises and lack of coordination between auditory, visual and motor centers. That these numerous possibilities were eliminated in the retests is proven by the fact that more than two-thirds of those re-examined with the 4-A showed normal hearing.

After the second test there were 747 pupils still showing a hearing loss of 9 or more sensation units. These were then tested with the 2-A with the result that 240 showed normal hearing. This emphasizes the importance of checking up with the 2-A audiometer. Finally 339 cases or 3.5% showed defective hearing and 168 cases or 1.7% showed borderline defects, giving a total of 507 or 5.2% hearing defects of the total of 9,741 school children tested.

noises; particularly where there has been pain previously in both ears. In other words 1,244 pupils gave a history of previous earaches in both ears and 1,259, nearly the identical number, reported bilateral head noises. In the majority of instances the same children reported both of these findings.

Table 3(b).

Analysis of Histories of Table 3(a).

Total number of children tested	9741
Total number giving history of previous earaches	3253 or 35%
Right ear	1051
Left ear	958
Both ears	1244
Total number of previous ear discharges..	1068 or 12%
Right ear	350
Left ear	340
Both ears	378
Total number showing present discharge...	139 or 1.5%
Total number showing tinnitus.....	2430 or 26%
Right ear	671
Left ear	500
Both ears	1259

This information was elicited from the test sheets which included the following questions:

Did you ever have an ache or pain in your ear?.....
Which ear?.....When?.....
Did you ever have a running ear?.....Which ear?.....
When?.....
Does it run now?.....

Note the proportional relationship between previous earaches and presence of or history of head

Do you ever have noises in your ear, like buzzing, hissing or roaring?.....Which ear?.....When?.....

In general one must not depend too much on these facts answered by the children themselves. However, repeated surveys should provide more reliable data for comparative study of these histories. Emphasis may be laid here on the necessity of reporting all absences due to ear, nose or throat ailments and exanthemata in order to furnish a basis for more accurate histories. The follow-up examinations among these absentees often should enable us to discover early manifestations of deafness that may be developing.

In analyzing the previous tonsil and adenoid and mastoid involvements in the total of 9,741 school children in this survey the following figures were gleaned (see Table 4)

TABLE 4

Previous Tonsil and Adenoid and Mastoid Operations in All School Children Examined, by Schools

P S	Previous T & A Ope	Previous Mastoid Op			Total
		Right	Left	Both	
1	59	2	0	0	2

27	40	2	0	0	2
JHS	359	4	5	2	11
AHS	426	7	8	1	16
Total	2852	37	40	8	85

Thus it is seen that 2,852 children or nearly 33 1/3% had had their tonsils and adenoids removed while 85 children or 85% had had a mastoid operation. Of these 85 mastoid operations 37 were done on the right ear, 40 on the left and 8 were bilateral.

The routine of this procedure was as follows. All pupils requiring a 2-A test (numbering 747) were given an ear, nose and throat examination, and in some instances supplemented by translucination of the sinuses. The tabulated results in Table 5 covers only the findings of 507 children showing defects in hearing after the 2-A tests. The results in the remaining 240 cases were not here tabulated but were recorded on the individual health records for follow up work. Many of

	Adenoids			60			33

these children showed multiplicity of defects. There was a special correlation between chronic hypertrophied tonsils and adenoids and deafness, due to tubal and middle ear catarrh.

Occasionally some tonsil stubs were noted but in no instance did these lymphoid tabs seem to be harmful. More than 80% of the perforations noted were of the healed and closed types. Some that were healed but not covered with a thin scar showed granulations about the margin and in only about a dozen instances was there complete or nearly complete absence of drum. Calcified plaques were more numerous than expected.

One active case of mastoiditis was discovered, as well as six acute sinus infections.

We wish to emphasize the importance of the discovery of these defects during childhood. For in all of these cases the parents are notified and urged to place the children under care of their family physicians or competent specialists. The school examination in this field as in other health fields is primarily diagnostic and in no way encroaches upon the practice of the private physician in the community. Without cooperation of parents and physicians the value of this school health activity would be entirely lost.

There was a striking prevalence of hypertrophied and infected tonsils and adenoids found among the children showing defective and borderline hearing. This proves beyond a doubt that many normal hearing pupils were saved from developing ear conditions by the early removal of diseased tonsils and adenoids. This is evinced

by the fact that at least 33⅓% of all children in this survey had had a previous tonsil and adenoid operation. (See Table 4.)

On the other hand, of the defective and borderline cases examined 222 out of 507 or 40% showed enlarged tonsils; 131 or 25% showed infected tonsils; while 93 or 18% showed adenoid vegetations.

This also leads us to conclude that any child found in a routine school examination to have diseased tonsils and adenoids, should have its hearing watched although no signs of diminished hearing may be evident at that time.

TABLE 6

Defective and Borderline Cases According to Sex

J.H.S.	20	12	1298
A.H.S.	17	15	1548
Total	259	247	9741

Our findings coincide with other similar surveys as regards the distribution of hearing by sex. As is noted in Table 6 the incidence of defective hearing is about the same in both sexes.

An Attempt to Ascertain Relationship Between Hearing Defect and Mental Achievement

An attempt was made to correlate the National Standard achievement tests with the audiometric tests to discover if there exists any connection between defective hearing and learning capacity. The sixth grade was selected for this study because it was at that time the only grade in which the achievement as well as the audiometric tests had been completed.

Of the 68 sixth grade children with faulty

hearing the achievement tests of 40 were available. Of these, the results are as follows:

29 or 72% were below normal.

11 or 28% were normal or above normal.

This suggests a definite relationship between defective hearing and mental achievement. It will be interesting to follow this comparison through further studies as both achievement and hearing tests are repeated.

A Study of Hyperacute Hearing Group

One of the schools, namely P.S. 17, showed an unusual number of bilateral hyperacute hearing pupils. Out of 218 pupils tested with the 4-A, 118 or nearly 55% heard at —3 sensation unit loss with both ears. This is equivalent to hearing a very faint distant whisper. Of the remaining 100, 94 showed normal hearing in both ears. Of the other 6, 5 had defective hearing and 1 showed borderline defect.

A further analysis of these two groups as to their histories shows the following facts.

TABLE 7

It is difficult to account for the high incidence of previous earaches, ear discharge and head noises among the hyperacute cases studied in this

group. One of the possible explanations may be that this school has maintained the highest record in discipline, health, mental achievement and parental cooperation. Therefore it is reasonable to assume that the various physical ailments that may develop, are promptly attended to by the parents and not permitted to become chronic.

This group is comprised of those children showing more than 30% bilateral hearing loss with the 2-A, or 50% or more unilateral hearing loss with the 2-A. The reason for including the latter is that being so handicapped in one ear, there is possibility of involvement of the other ear in the future. Early instruction in lip reading is therefore a foresighted measure in these instances.

TABLE 9

Albany is among the progressive cities which provides separate instruction in the public school system for the very deafened child. Two specially trained teachers instruct this group in both grade work and lip reading.

Conclusions

1 Of a group of 9,741 children tested, 339 or 3.5% showed definite defective hearing while 168 or 1.7% showed borderline defects, giving a total number of 507 or 5.2% of children with impaired hearing.

2 The large incidence of hypertrophied and infected tonsils and adenoids among the children with impaired hearing shows this to be a definite factor in the production of deafness.

3 Tubal catarrh or middle ear involvement in this group plays a more important role in the production of impaired hearing than does the evidence of previous drum abscesses.

4 We cannot emphasize too strongly the urgency of discovering hearing defects in early childhood. It has been estimated that the follow-up work and correction of these physical defects should reduce the incidence of deafness in children to less than a fourth of the present total.

5 Sex does not seem to be an important factor in the incidence of deafness.

6 Impaired hearing is a definite cause of mental retardation. Recent statistics show that from 10 to 12% of the school budget goes toward the expenditure for the repeating child, and nearly 60% of this expenditure is traceable to the hard of hearing child.

7 Prompt parental cooperation in correcting ear, nose and throat defects lessens the possibility of development of impaired hearing.

Recommendations

1 A thorough hearing survey is an essential need in the modern educational program. It is the consensus of opinion that such a survey should be conducted two or three years in succession. After that period, all incoming 3rd year classes, all new pupils entering the school system and all defective and borderline cases should be examined annually or more often when indicated.

2 Absences due to ear, nose and throat diseases, and the various exanthemata should be given hearing tests on their return to school.

3 All children with defective speech (stuttering, stammering, etc.) should have a routine hearing test. It has been pointed out that many of these conditions are due to imperfect hearing.

4 The hearing survey and examinations should be conducted by a part time otologist. He should have to assist him a school nurse, assigned to this particular work, whom he can train in the technique of testing.

5 All cases of impaired hearing should be promptly reported to the parents who should be urged to place the children under the care of their family physicians or otologists. Where financial handicaps exist, the children should be taken to ear clinics for treatment.

6. Lip reading instruction should be given to all pupils showing a bilateral hearing loss of more than 30% or a unilateral hearing loss of 50 or more per cent.

7. A proper understanding on the part of the classroom teacher of the psychology and intelligent handling of the hard of hearing pupil is very essential for his educational development. Some suggestions as to classroom handling of the hard of hearing child are:

(a) front row location.

(b) additional rest periods.

(c) kindly encouragement without emphasis on the handicap.

8. Each school should have a "permanently quiet room" for the eye, ear, nose and throat examinations according to Dr. E. P. Fowler of New York. Such facility would give more accurate results in the tests by eliminating extraneous noises.

ORAL FOCAL INFECTION

Under What Conditions Should Pulpless Teeth Be Removed

By H. R. MILLER, M.D., NEW YORK

Attending Physician, Sydenham Hospital; Associate Attending Physician, Montefiore Hospital.

Read before the Second Combined Medical and Dental Meeting of the Westchester Dental Society, December 15, 1931.

IN THE comparatively recent practice of medicine the conception has arisen that a localized primary infection can cause systemic disturbances and even organic changes. Many tissues and organs have been mentioned as the site of this primary focal infection, viz.—the teeth, the jaws, the gums (pyorrhœa), the uveal tract, the nose, the sinuses, the Waldeyer ring of lymphatic tissues, the bronchi, the pleuræ the lung parenchyma, the hiluses of the lungs, the gastro-intestinal tract and the gall-bladder with its passages, the genito-urinary system (prostate, seminal vesicles, bladder, adnexia, uterus, kidney pelvis and kidney itself), the bony skeleton, the joints and the skin. This list does not exhaust all the possibilities but serves to indicate how wide in range is the possible occurrence of a local infection. In this paper our more immediate concern is with the role which the oral infections play in general medicine.

Oral infection in this connection* was more

* For the notes on the historical data I am indebted to Dr. G. Stein of Vienna.

than a vague notion as early as 1828 when Leonhard Koecker recognized the "influence of infected teeth upon the entire body." In 1884-1885 Miller and Kaczorowski quite clearly recognized primary oral infections. The last two decades have been marked especially by much work and discussion along this line. Thus William Hunter (1910) in his McGill Lecture definitely spoke of the relation between mouth and the body infections. Billings (1912) and Rosenow (1915) began their experimental studies on this problem and since then work has appeared, to mention but a few, by Black, Brophy, Buckley, Henrici, Hartwell, Price, etc., in this country, and by Falta (1919), Höglér, Antonius and Czepa abroad. As is well-known the American authors about this time came to believe that the tonsils and root canal infections were chiefly responsible for associated systemic infections, although Falta in a personal talk in Vienna (September, 1930) stated that he had had the same idea independently as early as 1915. Schottmüller's original work on streptococcus viridans was an important

milestone because this bacterium was observed in focal teeth infection and in distant body organs.

In our more practical study as to when and under what circumstances should pulpless teeth be removed there are at least three (3) chief considerations:

(1) First, there must be no important contraindication, for example, a marked bleeding tendency in the patient as in hemophilia in males or in patients with hemorrhagic tendencies associated with blood diseases such as leukemia, pernicious anemia, or thrombocytopenia (changes in the quantity and, very likely, in the quality of the blood platelets). Another example would be the presence of an already existing lethal disease, i.e., sarcoma, carcinoma, advanced tuberculosis, acute leukemia, or Hodgkin's Disease. No extirpation of teeth should be undertaken in fever states like typhoid, cerebrospinal meningitis, in acute encephalitis lethargica. Similarly, the removal of teeth is contraindicated in patients suffering with cardiovascular diseases, especially during stages of heart failure decompensation or shortly after an acute coronary vessel thrombosis or in recent hemiplegics or in acute rheumatic endocarditis or pancarditis. Marked hypertension as well as uncontrolled or severe diabetes may also be contraindications. These conditions are examples, there are others also, which make the removal of teeth inadvisable and even uncalled for.

(2) Second, there should exist a strong plausible causal relationship between the patient's general condition and any pulpless teeth he may have. We have already noted that many observers sensed this clinically and were even certain of such a relationship because of experimental evidence but the practicing dentist and physician often still remain in doubt. They hesitate to give advice or to remove pulpless teeth because no sure relationship is demonstrable with regard to systemic symptoms that may be present. Moreover, it is known that some patients do well, medically speaking, when their pulpless teeth are out while other individuals show no improvement even when they are made toothless. Obviously, the haphazard empirical extirpation of teeth can lead to no data for sound deduction and sound practice. However, there do seem to be conditions the validity of which have been strengthened by repeated reliable observations in which the removal of pulpless teeth is valuable, viz.—joint disturbances, myositis, nerve afflictions (sciatica, trigeminal), unexplained secondary anemias and unexplained prolonged fevers (the latter two conditions being in reality signs of sepsis). Here the mouth may be rid of pulpless teeth, particularly if, as is so often the case, practically all other sensible and available therapeutic measures brought no relief. At this point we could discuss the local and general indi-

cations for surgical interference but we shall postpone this for the moment. We must, however, again repeat that at best, the relationship between pulpless teeth and systemic disease is inferred, at present, excepting, of course in the mind of Rosenow who feels that he has demonstrated such a relationship. Rosenow's investigations are well known. They represent painstaking careful studies carried on over many years. In many quarters, however, his deductions are not accepted chiefly because his bacteriological studies are not readily repeated and also because there is, as a rule, only meagre reliable clinical data in general. Thus, in questioning good observers like Falta, Stein, Gotthelb in Vienna, one gained the impression that here and there clinical improvement could be ascribed to the removal of pulpless teeth but that more frequently no clinical improvement occurred. The important point at issue is whether it is permissible to interpret this improvement as due to the removed teeth since so many cases show no relief after the same procedure and since improvement in chronic medical conditions may be spontaneous in a limited percentage of cases. Nevertheless, it can not be denied that there are clinical circumstances when attention is strongly directed to pulpless teeth as the etiological factor. These are polyarthritis, uveal tract infections, infections of the sinuses, nose and throat, skin conditions like eczema, urticaria erythema multiforma, maybe, endocarditis. To these von Passler (1930), at the Congress at Wiesbaden, adds metabolic disturbances, febrile conditions, and psychic derangements.

(3) The third consideration is really related to and part of our second consideration but is discussed separately because of its clinical importance. Pulpless teeth may be removed when they are impugned to or, better, known to harbor bacteria or toxins capable of involving various structures in the body such as the heart lining especially about the valves, the joint membranes, lung tissues (abscess), bones, etc. This subject is by no means clear but there is a strong presumption that bacteria like anhemolytic streptococci, often recovered from pulpless teeth, may infect organs and tissues as mentioned above. Accordingly the removal of such teeth may be a valuable prophylactic measure in dental and medical practice.

We may now turn to the question what are the more direct indications for the removal of pulpless teeth?

Dental Indications

1 These I touch very briefly, they are not in my field. It may, however, be permissible to emphasize three points, first the value of light percussion of all teeth at every dental examination. Dead teeth are insensitive, of course, but teeth

slightly sensitive to delicate percussion should be watched. These sensitive teeth, later quiescent or dead, may prove to be the starting point and possibly the true primary focal point of a systemic disorder. Unless the dentist knows of the presence of such teeth their significance may never come to light. The second point is in the history of the patient. The dentist should question carefully if there were any other teeth, diseased or inflamed, or gums, etc.; or if *at the time* of the appearance of constitutional symptoms any tooth began to ache. Frequently tooth trouble, unless, very severe, escapes the recognition of the patient, dentist, and doctor because the patient is suffering much with his general condition or his general disturbance is long drawn out over months and years. A third important point is the discovery in a patient's history that he was compelled to interrupt any dental work (especially root canal work) because of the onset and development of generalized or medical symptoms. If it can be established that the *onset* of a general disease began with a tooth infection then such a tooth should be removed unhesitatingly.

These dental considerations were pointed out to me by Dr. G. Stein of Vienna.

The Medical Indications

We have, for the most part, already reviewed these. Here we may summarize them under three headings, first when all other methods have been found wanting, second where there is a sensible and reasonable presumption that much may be gained prophylactically, and third when medical conditions exist that are chronic, unyielding and generalized in character and distribution as in slow moving sepsis or else localized in organs and tissues and so suggest the possibility of secondary focal depot formation.

Laboratory Methods

Generally speaking these are not accurate means for estimating which if any pulpless teeth should be removed. The *x*-rays, obviously, have a direct and special usefulness in diagnosis. The bacteriological and serological procedures in this connection, however, are not sufficiently practical

according to the work and views of most observers, for instance the complement fixation for streptococci, the agglutination test, these are not yet conclusively established as clinically valuable.

The blood in general can give us an idea of the state of anemia or the presence of disease and blood examination is, therefore, a valuable medical test.

Clinical Data

As is well recognized many patients have teeth infections for years yet develop no apparent medical disturbances. Conversely, many patients have localized medical disease in the zones and organs proved to be secondarily infected and yet their teeth seem normal.

In the Vienna Arbeiterversicherungsgesellschaft 78,039 cases were treated in 1929. (This year (1930) a 50% increase is anticipated.) There were 40,000 fillings, 12,000 extractions, 1,800 root fillings. Dr. Grossman, the chief dentist, stated that he could recall few patients who had any systemic complaints. He personally observed over 100 cases for the removal of chronic infected and non-infected cysts, apical infections, and observed no general constitutional disturbances. Perhaps two or three times a year a physician refers a patient to him with oral sepsis and general disturbances where a search for a causal relationship is required.

Dr. George Stein (Vienna) treated in Falta's clinic about 120 cases of general medical conditions associated with pulpless teeth, some infected, some not. Extractions were done in all cases and the patients carefully followed up. He believes he observed definite clinical improvement in about 10 to 20% of his cases. The improvement occurred only in cases with joint trouble, in acute nephritis, in skin conditions like erythema multiforme and lichen urticaria, also in a few cases of streptococcus viridans endocarditis he saw clinical improvement when the pulpless teeth were out. Stein feels that the "relationship" between pulpless teeth extraction and general clinical improvement is probably greater than 10 or 20% because there are, very likely, secondary "settled" infections in various parts of the body and in these cases the extraction of the primary focal trouble in the teeth is without effect.

THE DIVISION OF CANCER IN THE DEPARTMENT OF HOSPITALS

By J G WM GREEFF, M.D, NEW YORK, N Y

An address at the Dinner of the Cancer Division, at the Commodore Hotel, on December 16, 1931

THE Department of Hospitals realizes ever more acutely the need for centralized control in its various activities. Only through centralization may complete coordination be attained. The Department itself owes its birth to the present tendency toward such centralization. And throughout its functioning it constantly endeavors to integrate its efforts in the interests of efficiency.

Thus have arisen the different Departmental Divisions. The high and uniform standard of service resulting therefrom has already proved their merit. And of the Departmental Divisions none is more important to the welfare of the city than the Division of Cancer.

Cancer is now recognized as a health menace against which municipalities must take protective measures. The cancer death rate shows a steady increase as the years go by. And this increase cannot be accounted for entirely by the fact that diagnostic technique has improved within recent times or that, with the lowered mortality in the younger age groups, more persons reach the period of life when cancer is most likely to appear.

In addition, our lack of knowledge as to the cause of cancer and our helplessness to cure it, once it has gained headway, make this disease a matter with which the community must be vitally concerned.

As the situation stands today, the community is in duty bound to take certain steps in an attempt to check this rising menace. It must educate the general public as to the necessity of early diagnosis and treatment and the possibility of preventing the development of cancer through the allaying of pre-cancerous conditions. It must place at the disposal of the people the services of specialists in the diagnosis and treatment of cancer. It must provide these specialists with every modern scientific facility for the exercise of their profession. It must train future cancer specialists. And it must do all in its power to further cancer research.

The City of New York endeavors to fulfill these obligations through the Division of Cancer of the Department of Hospitals.

Since its inception, the Division of Cancer has made encouraging headway in integrating the Department's cancer work. It goes without saying that the Department will continue to give it unqualified support.

The Department of Hospitals is aware that patients requiring radiation therapy are most effectively treated when centralized in units specifically equipped for this work. There must be the proper equipment for X ray therapy, a sufficient amount of radium and a specially trained and ef-

ficient personnel. Through the efficient organization of the Division of Cancer this desired centralization is now in effect. The Division deserves great credit for having achieved so much under the handicaps of limited facilities and lack of space.

We believe that in the future these handicaps will be removed. The projected *cancer hospital*, which the City hopes soon to build, will mark a new chapter in the annals of the Division of Cancer.

It is planned to place the new hospital on First Avenue between 30th and 31st Streets, adjacent to the new psychiatric hospital. It will thus become part of the great Bellevue medical centre.

Here will be provided every facility for the diagnosis of cancer and for its treatment by all approved methods. There will be sufficient space for the hospitalization of patients to a far greater extent than is possible under present conditions. Adequate quarters and modern equipment for research will be provided.

Such a hospital will undoubtedly attract to it eminent workers in the field of cancer who will find therein opportunity to pursue unhampered studies. Bellevue Hospital has long attracted men renowned in every branch of medical science. A cancer institution in conjunction with Bellevue must give the stimulus of new horizons to specialists in this field.

From the standpoint of teaching facilities, the plan to place the new hospital in the vicinity of Bellevue is particularly fortunate. Allied with three great medical schools, Bellevue offers unusual teaching opportunities. And teaching facilities in a hospital promote the welfare of the community in more ways than one. Not only is the community insured future physicians and future specialists who know their subjects, but the hospital in which teaching is carried on gives better service to the community.

This fact is generally acknowledged. Let me, however, quote Doctor Richard C Cabot on the subject.

"A hospital," says Doctor Cabot, "is almost certain to rise to a better standard of usefulness to its patients and to attain strikingly higher standards—both technical and humanitarian—when medical students and medical teachers become a part of its organization and help to carry on its daily work. There is no question that medical students and medical teachers focus upon the central tasks of diagnosis and treatment an amount of energy and conscientiousness that cannot be attained without their presence. There is less carelessness on the part of nurses and doctors, less neglect, fewer blunders, less reliance on

antiquated and useless methods. Criticism and inquiry are in the air. One has to justify one's ways and convince others. One cannot conceal one's shortcomings of patience, one's laziness, one's petty tyranny, one's inhumanity and selfishness—or rather, it is much harder to do so, when the results of one's work have to be shown to students and described in lectures as good examples of modern science, or now and then as awful examples of modern blundering. With such possibilities in view, people brace up and 'watch their step.' They may even catch the inspiration and the current of better ways and be transformed inwardly as well as outwardly."

The Department of Hospitals agrees with these views. It is endeavoring to increase facilities for teaching throughout its institutions. But of all its institutions Bellevue, in point of view of numbers, possesses the greatest wealth of clinical material. Thus, by forming part of the Bellevue centre, the new cancer hospital will both reap the benefits of the existing teaching facilities and enhance them further.

The new hospital, however, is still a thing of the future. The Division of Cancer must carry on with its existing equipment. At present it is working under many handicaps.

An immediate need is the rebuilding of Brooklyn Cancer Institute. The necessary processes for this undertaking have already been begun and it is hoped that work will be started before the first of the year. Until the renovation is completed, the staff of this institution will undoubtedly go forward with its work under makeshift conditions as splendidly as it has done heretofore.

The Cancer Hospital on Welfare Island has long been cramped for space and needs much in the way of equipment. In accordance with these needs the Department of Hospitals plans to enlarge and remodel this hospital and hopes to institute this work before much time passes. It is essential that the City do everything possible to comfort patients suffering from advanced stages of cancer and to alleviate their suffering. And it is greatly to the credit of this institution that under present conditions so much has been accomplished to this end.

To proceed effectively with cancer work an adequate supply of radium is necessary. The Division of Cancer at present has at its disposal five grammes of City-owned radium and an additional gramme secured by the Director as a loan from the Radium Belge, the Belgian Government radium agency. To supplement this amount, the Department of Hospitals is planning to purchase new quantities of radium during the course of the next year.

No talk on the subject of cancer control would be complete without mention of social service.

The modern hospital is realizing ever more clearly the invaluable role of the medical social worker. The Social Service Division of the Department of Hospitals is a vital unit in the effective functioning of the City's institutions. And nowhere is the social worker more greatly needed than in cancer work.

The social worker acts as a liaison between the hospital and the community. Through effective follow-up work after the patient leaves the hospital she sees that the patient receives any necessary medical attention and is not left stranded financially. While the patient is in the hospital she inquires into his home conditions and relieves his mind of the burden of responsibility. If, on his discharge from the hospital, convalescent care is required, she makes sure that he receives it. Her work accomplishes two purposes. It gives direct aid to the individual patient. And through this direct aid it helps the community, preventing the patient from remaining indefinitely a public charge.

In the case of the cancer patient, the social worker becomes of paramount importance. The sufferer from cancer becomes steadily more dependent. Treatments must be carried on over a long period of time. They become tedious and the patient may begin to doubt their use.

Here the social worker comes forward with encouragement. She heartens the patient and makes him see the necessity for reporting regularly for treatment. She familiarizes herself with his economic status and prevents unwarranted distress. Hers is the difficult task of bringing hope and peace of mind to the despairing sufferer and assistance to his dependents. Without her ministrations cancer would bring even more desolation than now follows in its wake.

The Department of Hospitals realizes these facts. It will do everything possible to aid social service in cancer and to widen the scope of the social worker.

As long as cancer remains an enigma and as long as cancer continues to increase its toll, the City of New York must press forward its efforts to protect the public. The Division of Cancer is the medium through which these efforts must be carried out. And the Division of Cancer is most worthy to bear this high responsibility.

From small beginnings it has built up a noble undertaking. Under heavy odds it has attained a remarkable efficiency. The Department of Hospitals is fortunate, indeed, to possess as one of its units an organization composed of such loyal and indefatigable workers who are tackling undauntedly a problem of disheartening proportions—the eradication of cancer.

To this organization the Department of Hospitals will promise unflagging support.

HEPATIC ABSCESS DUE TO REFLUX OF DUODENAL CONTENTS FOLLOWING CHOLECYSTECTOMY

By HENRY M. FEINBLATT, M.D., BROOKLYN, N. Y.

IN a previous article,* the author emphasized the importance of the gallbladder as a means of equalizing positive pressure flow to the duodenum. This case is reported as an instance in which cholecystectomy was a probable factor in permitting reflux of duodenal contents back through the bile ducts into the liver.

Mrs. J. O., aged 45, was admitted to the Kings County Hospital, December 16, 1930, complaining of chills, vomiting, malaise, constipation and belching. She was the mother of three children and had been well until twelve years ago, when she became ill with belching, epigastric distress and pain in the right upper quadrant of the abdomen. After these symptoms had persisted for about eight months, cholecystectomy was performed. The distress was not relieved by the operation.

In the past twenty months, the symptoms increased in severity so that there was pain in the epigastrium about two hours after meals, which was partially relieved by sodium bicarbonate. During this period she visited fourteen different institutions and had fourteen gastro-intestinal X-ray series.

The present illness began acutely a week before admission with a chill and vomiting. The chill lasted one-half hour and was followed by a febrile reaction. The patient failed rapidly from that time on.

On admission to the hospital, temperature was 102° F., pulse 120, respiration 30. The patient was emaciated, weighing 90 pounds. She was restless. There was herpes about the lips and cyanosis about the eyes and finger-tips. The tongue was coated. The abdomen showed practically no subcutaneous fat; there was no tenderness, rigidity or masses. The extremities were thin and relaxed; the knee-jerks absent.

X-ray examination revealed no lesion of stomach or duodenum. There was a small residue in the stomach at the end of four hours after the barium meal. The large bile ducts and some of the smaller radicals show the reflux of barium from the duodenum and are clearly outlined.

The white blood cell count on December 17 was 10,000; polymorphonuclear cells, 69 per cent. The red cell count was 4,128,000; hemoglobin, 85 per cent. On December 26 the white cell count was 13,650, with 78 per cent polymorphonuclears. Wassermann reaction and Widal test were negative.

The patient's condition became progressively worse with increasing toxicity and asthenia, and she died December 29.

On postmortem examination the anterior surface of the liver was covered by adherent omentum. At the lateral anterior margin of the left lobe, the omentum was particularly tightly bound down. On removing it, a thin, foul, yellowish pus exuded from the liver. Further examination revealed an abscess about 4 cm. in diameter. On the anterior surface of the mid-portion of the right lobe, there was a fluctuating area 8 cm. in diameter. On section it was found to contain about 150 cc. of thin, yellowish-green pus. The liver weighed 2150 Gm.

On histologic examination, the liver showed diffuse cloudy swelling. In the abscess, the lesion was typically that of suppurative inflammation.

Other lesions found at the necropsy included vascular nephritis, chronic splenitis, small punctate hemorrhages on the mucous membrane of the stomach, ovarian cyst and healed tuberculosis of the pulmonary apices.

CHOICE OF INSTRUMENT IN DELIVERY WITH FORCEPS*

By EDWARD H. DENNEN, M.D., F.A.C.S., NEW YORK, N. Y.

GIVEN a proper case for delivery with forceps, an operator may select the kind of instrument most suitable for the conditions. Delivery may be accomplished with only one, or at most two varieties of forceps. However, (other things being equal), a greater degree of success should be obtained with a knowledge of the advantages, and a discrimination in the use of the various kinds of forceps. There are several kinds of forceps, old and new, that have peculiar advantages under certain conditions. An attempt to make these differentiations may be of interest.

In delivery with forceps under proper conditions, there are two features of prime importance; the application of the forceps to the child's head, and the traction used in accomplishing the delivery. These two acts determine the manipulation, effort, and consequently, the associated trauma.

Application of Forceps: The application must be cephalic and accurate. In a true cephalic or bi-parietal application, the blades should fit the head, as far as possible. They should lie evenly against the sides of the head, reaching from the parietal bosses to, and beyond the malar eminences; covering symmetrically the spaces between the orbits and the ears. There should be no extra pressure at any one point.

A correct application is essential. It prevents injury to the head because:—the blades fit the head accurately, and pressure is evenly distributed; the pressure is on the least vulnerable areas; the increased diameter of the head, due to the thickness of the blades, is at the narrowest place, thereby minimizing the force necessary for delivery.

It lessens injury to the mother because the head advances in the proper attitude. It is vital to the technique of the delivery because it enables the operator to know the exact position of the head, and allows him to use the most favorable diameters. These conditions are not fulfilled by the undesirable brow-mastoid application.

In selecting an instrument with which a good application can be obtained, the choice depends upon a correct diagnosis of the amount of moulding, position and station of the head, and the type of pelvis.

On moulded heads, the best application is obtained with blades which have a long, tapering, cephalic curve. Those with a short, full curve do not fit evenly, causing pressure points, and often are not anchored below the malar eminences, with consequent cutting or slipping.

In considering the position of the head, the

instrument to be chosen is the one which gives the correct application with the least effort. When the occiput is anterior, the application is, as a rule, easily made, and any blade which fulfills the requirements of the moulding may be used. For other positions and presentations there are several new types which will be considered with the various forceps operations. A high head, in a flat pelvis may be angulated in such a position that a cephalic application cannot be obtained unless the forceps have the sliding lock principle.

Traction: The traction also plays a very important part in the choice. To use the least force, one should make traction in the pelvic axis. This is best accomplished in all stations of the head with some form of axis-traction forceps. Even in low forceps, it is valuable in obtaining flexion, and in eliminating the force wasted against the symphysis. The deep episiotomy, advocated by DeLee, allows the handles of the forceps to lie in a lower plane. This, with the use of the fingers as a fulcrum, may eliminate the necessity of axis-traction on low heads. However, the axis-traction principle automatically directs the force away from the symphysis, and thus simulates the physiological mechanism of labor.

Axis-traction suggests to many a difficult operation with a complicated instrument. For this reason, in the average case, it is often neglected though the advantages are admitted. The classical forceps, without axis-traction, are frequently used with the maximum force, modified by the Pajot maneuver. Axis-traction, however, tends to keep the force in the plane of least resistance, thereby diminishing the amount of effort and injury.

Selection of Instrument: In the selection of an instrument which fulfills the requirements of application and traction, there are a number of very excellent forceps from which to choose. Some are simple, others complicated. All have one or more good points, which justify their use when properly chosen. Some are so similar that there is very little choice between them. Most modern forceps of the classical type follow, in a general way, one of two constructions: the shanks overlap, and the blades have a short, cephalic curve as in the Elliott, or the shanks are separated, and the blades have a long, tapering curve as in the Simpson (Fig. No. 1). But not all of them have axis-traction. This disadvantage can be overcome in some, by the use of the Bill axis-traction handle.

Various localities have their favorites. In Boston and that vicinity, the light Good forceps with the traction rods from the fenestrations, concealed in the handles, are very popular. So are Irving's

* Read before the Section of Obs. & Gyn., Buffalo Acad. of Med., Dec. 16, '31.

FIGURE 1

Shows difference in construction in the two common types of forceps

with traction rods similar to Tarnier's. In Philadelphia, there is a preference for the DeWees, with the traction rod attached to the end of one handle. In New York, several types are used: DeLee's, DeWees', Tucker-McLane's, Hague-Ferguson's, Bailey-Williamson's, Lobenstein-Tarnier's and Elliott's (Fig. Nos. 2, 3, & 4).

Low Forceps: In a truly low forceps, most heads are in the anterior position. The mount of moulding, and the type of outlet determine the choice of instrument. In pelvis with a low pubic arch, and a short anterior-posterior diameter of the outlet, it is essential to choose a blade with a good pelvic curve. This will put less pressure on the perineum, and tend to avoid sulcus tears of the vagina during extension. In normal pelvis, the important factor is protection of the child's head—no cuts, no abrasions. Of course we do not wish any third degree tears, but that accident is guarded against by frequent use of perineotomy. It is thought that a cut perineum, well repaired, is better than one which is torn or stretched. It also relieves the pressure on the anterior wall.

The mother is, as a rule, a primipara, or perhaps a multipara in long labor. This usually means moulding of the baby's head, with its sides lengthened and flattened. A Simpson type of

forceps preferably DeLee's model, in which the blades have been lengthened, fits best. It has a long, shallow, cephalic curve, and the tips can be anchored well below the malar eminences, preventing pressure points and slipping. A blade with a short, sharp, cephalic curve, of the Elliott type is suitable for round heads. But when much moulding is present, it fits unevenly, and occasionally gives difficulty in proper locking.

For easy extractions, the solid blades of the Tucker-McLane are popular with some obstetricians. They are easy to apply and remove, and may be used on small round heads. But on moulded heads, they may slip, due to lack of anchorage below the malars, and they exert pressure on two points; the zygoma, and the parietal boss. The result may be a cut over the zygoma, just in front of the ear, and the appearance later of a swelling over the boss—a periostitis that lasts for weeks, and occasionally develops into an abscess.

Many times, what is thought to be an easy low forceps, later proves to be the caput of a moulded head, the bi-parietal diameter of which is at, or above the ischial spines. Then the operator wishes he had chosen a fenestrated blade originally. The solid blades are excellent as rotators in the first stage of the Scanzoni maneuver. A suitable fenestrated type may be used for the extraction.

FIGURE 2

Shows Elliott Types (except Tarnier)

Mid Forceps: In the mid forceps operation, more frequently than in the low, the position, as well as the shape of the head must be considered in selecting a suitable type of instrument. The rules for anterior positions are the same in all stations of the head, with emphasis on axis-traction. The DeWees gives the truest axis-traction, and is considered the choice by many. With the

FIGURE 3
Shows Simpson Types

head in transverse arrest, some operators have developed their skill in the use of manual rotation, and also the gliding maneuver. However, it is not an uncommon experience to find a head which cannot be rotated manually without displacement; or one which refuses to remain anterior during the process of applying the second blade, and locking the handles. In the gliding maneuver, the anterior blade occasionally hits the brow, causing the occiput to rotate backward. This may result in a brow-mastoid application, which no amount of manipulation will entirely correct. To simplify this procedure, two new types of forceps have been developed: the Kielland and the Barton. Their chief advantage is the ease with which an accurate cephalic application can be obtained. Both have the sliding lock principle which allows for adjustment on asynclitic heads. The Kielland, since it is built for traction, has a wider field of usefulness, and appears to be the choice.

In posterior positions the single accurate application, without displacement of the head, and semi axis-traction pull with the Kielland favor

FIGURE 4
Axis-traction Attachments on Simpson Types

better results, with less manipulation than the Scanzoni, Pomeroy, and "Key in Lock" maneuvers, or manual rotation. Also, the dangers of version in unsuitable cases are eliminated. The slight pelvic curve of the Kielland is a disadvantage in extraction through a funnel pelvis. It is thought best to remove the forceps after anterior rotation has been completed, and the head flexed and fixed with one or two tractions, substituting a suitable axis-traction forceps with a good pelvic curve. This keeps the force in the axis of the pelvis, increases the flexion, and lessens the danger of injury to the posterior wall and perineum. Following the proper use of the Kielland, rarely, if ever, are there any badly marked faces or facial palsies. The cushion on the inside of the blades eliminates the cuts and bruises, and the brow-mastoid application is avoided by using the inversion method of application. Much has been said about the dangers of the Kielland, but, as is true of any instrument, the dangers diminish as the knowledge of its proper use increases. Complicated cases have frequently been made simple by the Kielland,

FIGURE 5
Traction Curve Forceps

even after unsuccessful attempts with other types.

High Forceps: High forceps operations, of course, are frowned upon but occasionally, in well chosen cases, with version contra indicated, it is an easy procedure, offering, in experienced hands, less risk than Caesarean section. When the head is arrested in the superior straight, the same principles which apply to mid forceps are used, with one exception—a flat pelvis, with the head in the transverse position, and the posterior parietal bone presenting. Here, as was so well shown by Dr. Caldwell, the Barton forceps stand alone as the choice. The ease of application diminishes the amount of manipulation; the perfect pelvic curve reduces the amount of effort and minimizes the amount of injury; and the sliding lock permits adjustment as the asynclitism is corrected.

The author has had several cases of this sort, which after adequate trial labor, were being considered for Caesarean section. A tentative trial

with the Barton forceps, as a final test, resulted, with very little effort, in a successful delivery. In one other case, the Barton, not being a tractor, was not effective because of the resistance of a tight uterus, and a rim of cervix, so a Latzko extra-peritoneal Caesarean was done.

With the possible exception of the new Roderick forceps, personal experience with which is limited, the Kielland is the only other forceps now in use which can be properly applied to this particular type of case. It is not chosen, however, because when applied, it has no pelvic curve and no axis-traction. It increases the angulation of the head, and consequently, the diameter of the descending part is increased. This endangers the symphysis-pubis and bladder, against which most of the force is directed.

In face presentations, the advantages of the Kielland again make it the choice. This is particularly true when the chin is posterior. Here the blades may be applied directly to the sides of the head, with the pelvic curve directed backward. Then rotation of the chin to anterior, followed by extraction, may be done without readjustment of the forceps.

For the after-coming head in breech extractions, the Piper forceps are the choice. The springy blades permit adjustment to heads of different sizes and shapes, with the least amount of compression. The dropped handles make it easy to obtain an application directly to the sides of the head without raising the body above the horizontal. They also give axis-traction.

To simplify the choice of instrument for anterior positions of the occiput, an uncomplicated, light, fixed axis-traction forceps has been designed by Dr. E. M. Hawks and the author, described in the *American Journal of Obs. & Gyn.*, Aug., 1931 (Fig. 5).

Several principles are included in this instrument. The advantages of application and traction make the delivery easier and safer. The modified Simpson blades, with the Kielland cushion, tend to fit the head without pressure points or cutting, and they do not slip because the tips can be anchored well below the malar eminences. The exaggerated pelvic curve of the posterior lips of the blades permit extension over the perineum with the least amount of pressure on the posterior vaginal wall and sulci.

The modified Piper shanks give more spring to the blades, allowing accommodation to heads of different sizes and shapes with the least amount of compression. The backward curve of the shanks gives axis-traction. (Fig. 6). (The idea of this curve was obtained from Dr. Piper while

FIGURE 6

Line AB is direction of force applied to classical forceps. Line XY is the plane of handles of traction curve forceps, and is parallel to AD, the true axis-traction. Line AC is the resultant of force applied in the direction of XY

watching him demonstrate his forceps, intended for the after-coming head.)

SUMMARY

1. In a proper case for delivery with forceps, the two essential requirements are: an accurate cephalic application, and traction in the axis of the pelvis.
2. A correct diagnosis must be made of the amount of moulding, position and station of the head, and type of pelvis.
3. Moulded heads require a blade with a long, shallow cephalic curve.
4. Axis-traction diminishes the amount of effort and injury, and is desirable in any station of the head.
5. The large variety of instruments in use shows there is no universal forceps.
6. In most anterior positions, the Simpson type of blade, with some form of axis-traction is desirable.
7. In most posterior and transverse positions, the Kielland seems to be the choice. Rotation manually, or with the Barton or the solid blades, may be used in some cases.
8. A high transverse head, with a posterior parietal presentation in a flat pelvis, requires the Barton.
9. In face presentations, with the chin posterior, the Kielland forceps, and, on after-coming heads, the Piper forceps offer advantages.
10. A new traction curve forceps combining features of several instruments, and satisfying the requirements of application and traction may be used on anterior heads.

ROSTER OF OFFICERS

The roster of officers and committeemen of the Medical Society of the State of New York, as completed by the Executive Committee, appears on pages 806 and 816 of this Journal. The personnel remains largely unchanged, for the work of an organization as large as that of the State Medical Society requires an intimate knowledge which comes only from long experience.

The changes in personnel consist principally in the promotion of excellent workers from lower grades of service, for it is the ideal of the Medical Society, like that of the Army, that each officer shall prepare himself to fill the next office above his own. Each member of the State Medical Society will do well to preserve the list of officers for reference.

MENTAL HYGIENE

Two branches of medical practice have developed side by side,—the physical and the mental. The effect of physical conditions of the body on mental states is common-place knowledge. The extreme reverse of that statement,—that mental states may produce physical ills—has often been proven true in the practice of every doctor, but in many persons go so far as to believe that all sickness has a mental origin.

Every doctor is compelled to consider the mental state of his patient, and the most successful physician is he who does so unconsciously and naturally. On the other hand the doctor who ignores the desires and prejudices of the sick does not inspire the confidence of his patients and their families and friends, no matter how skilful he may be in dealing with physical conditions and diseases.

The branch of medical practice which deals with mental disorders has developed along its own line so far that it is almost separated from the practice of physical medicine—at least in the minds of most physicians and surgeons. It has its own vocabulary and expressions and its language is hardly understandable to the average doctor, but it must be remembered that every specialty has a language of its own. The ophthalmologist, for example, is compelled to use terms which the average doctor does not understand simply because he has no use for them in his daily practice.

The vocabulary of any specialty applies principally to fully developed conditions and diseases. The modern science of mental trends and disorders is so new that nervous states are usually ignored until they are fixed and difficult to change, as are physical inflammations in the stage of fibrosis. As any branch of medicine advances, the time of the possibility of making a diagnosis recedes to the earliest stage of the disease when it is curable or even preventable by simple means. Family doctors have the opportunity to deal with mental disorders in their very incipency. These conditions are usually concealed or excused by both the patient and the doctor until they are in advanced stages. If the family doctor has in mind the clear indications of states of nervousness and other abnormalities of his patients, he will be able to recognize impending dangers and advise his patients and their families regarding the cure of the present conditions and the prevention of actual mental diseases.

Mental disorders are recognized by the State of New York to be of as great importance as those of physical origin. This is shown by the establishment of two departments to deal with diseases.

1 The Department of Health which deals with physical disorders

2 The Department of Mental Hygiene, which deals with mental abnormalities.

The Department of Health has reached a stage of development when its principal work is that of the prevention of physical diseases.

The Department of Mental Hygiene also has prevention as its ideal, but practically its major work is the care of patients in advanced stages of mental disorder, as is shown by the fact that the largest item in the annual budget of the State of New York is that for the care of the mentally incompetent.

The greatest factor in the prevention of physical diseases has been the intelligent cooperation of family doctors in all phases of the work of the State Department of Health.

The greatest factor in the prevention of mental disorders will be a similar cooperation of family doctors with the State Department of Mental Hygiene.

The Department of Health of New York State secured the cooperation of family doctors over thirty years ago by instituting a system of instruction of practicing physicians, beginning with health officers numbering over six hundred, and extending its influence to family doctors and medical students.

When the instruction was begun, allergy, and immunity, and susceptibility, and vaccination were as obscure to the family doctors as subconscious states and dual personalities are now, and the Wassermann reaction was as mysterious as psychoanalysis.

The method of teaching the pathology of physical disease has been simplified until now it is a basic subject begun in the first year of instruction in the medical school.

The pathology of mental states or emotions has now reached a stage of clarity and unity in which it is understandable by the average doctor; but its fundamental principles are usually taught to students in their fourth year, and then only in conjunction with other specialties, such as ophthalmology and laryngology. The result is that students and family doctors are not taught the fundamental principles of mental pathology as they are those of physical pathology, and naturally family doctors do not take a spontaneous interest in the subject of mental disorders, but consider them to be outside of their field of practice.

Teachers in mental hygiene sometimes assume that general practitioners already understand the fundamentals of mental pathology and often make apologies when they attempt to explain these basic facts. These teachers need not fear that they will "insult the intelligence" of their medical audiences. Physicians like to have a lecturer preface his talk with a simple review of the patho-

logical principles underlying his subject, thereby fixing the attention of his listeners on the principal point which he is developing. There is need that specialists in mental diseases shall develop a simple syllabus of instruction covering the fundamental principles of mental pathology. Such a syllabus will be warmly welcomed by medical students and the medical profession.

Practising physicians are interested in all phases of the activities of the State Department of Mental Hygiene; and the Department has the opportunity to reach the doctors by means of the staffs of the State Hospitals scattered throughout the State. The staffs may come into close contact with general practitioners in three ways:

1. By friendly cooperation with the doctors in diagnosing and treating patients.
2. By taking active parts in county society activities, especially by conversations with individual doctors who are interested in mental hygiene.
3. By developing a system of teaching the fundamental principles of mental pathology.

The State Hospitals reach physicians through

impersonal clinics conducted in general hospitals and health centers. A development much to be desired is that family doctors shall feel free to consider members of the staffs of State Hospitals and friendly consultants in regard to their private cases.

The development of a system of teaching the elements of mental pathology has been considered by the staff of Kings Park Hospital in cooperation with the Suffolk County Medical Society. The experiment, though brief, has revealed the fact that a great difficulty in the development of such a system has been that the line of thought of mental specialists has been divergent from that of the practitioner in other branches of medicine. The problem is to make these lines of thought converge, and to discover the common points of contact between the general practitioners and the psychiatrists.

When the two groups of medical men meet on a common sympathetic ground, the practice of mental hygiene can become habitual with family physicians.

GRANT C. MADILL, M.D., LL.D.

The physicians of New York State in active practice share the honor conferred upon one of their own number, Dr. Grant C. Madill, of Ogdensburg, to whom the New York University gave the degree of Doctor of Laws on Commencement Day, June eighth.

The honor has come to Dr. Madill in the natural course of the development of his experience and opportunities. He has been a center of influence which has extended in ever-widening waves. He is first of all a surgeon, deeply interested in his specialty, and in the physicians by whom he is called in consultation. His influence has extended naturally through the St. Lawrence County Medical Society and the Fourth District

Branch, to the Medical Society of the State of New York, of which he was President in 1919.

Dr. Madill has also developed the cultural side of his life, as is attested by his large library on historical, economic, and philosophical subjects—and those books are equally as familiar to him as are those on medicine.

The opportunity for the practical application of his broad culture came in February, 1930, when the Legislature elected him to the Board of Regents of the State of New York.

The crowning recognition of a life successful both professionally and culturally, and of a career of civic usefulness, is the action of the New York University in making Dr. Madill a Doctor of Laws.

LOOKING BACKWARD

This Journal Twenty-five Years Ago

Press Publicity: This Journal of July, 1907, contains the following news item showing one phase of the attitude of the newspapers toward public health a quarter of a century ago:

"*The California State Journal of Medicine*, according to the *Journal of the American Medical Association*, exposed an atrocious humbug, the 'Viavi Treatment,' which has been doing incalculable damage to gullible invalids. It is clearly shown that this 'system' is operated without even a suggestion of consideration for its dupes. The *California Journal* sent marked copies of this exposure to every San Francisco newspaper. One

weekly and one daily made faint reference to it. Immediately, however, in all of the San Francisco newspapers large advertisements of Viavi appeared, and no further news notice was paid the subject—excepting that the daily which had referred to the fraud repented of its freedom of speech, and published as reading matter a complimentary write-up of the humbug and its backers. In other words, the press prostitutes itself to the criminals who prey upon the sick, and sells its freedom of expression for their patronage. Little boys at school are no longer making declamations upon 'the freedom of the press.'"

MEDICAL PROGRESS

Thrombophlebitis Migrans vel Recurrens.—F. Parkes Weber and E. Schwarz believe that thrombophlebitis migrans is probably due to an infection of low virulence, though as yet no causative microbe has been cultured from the patient's blood. It is also possible that a constitutional or vascular condition may predispose to the infection. In support of this theory they cite the case of a man who had recurrent attacks of thrombosis over a number of years and who gave a history of having had primary syphilis at the age of 18. Pearce Gould reports a case, in which the first attack of thrombosis occurred during convalescence from typhoid fever. J. B. Ellison describes mild thrombophlebitis migrans complicating scarlet fever in two boys. The authors make the point that in apparently healthy young adults, with a history of having suffered from two or more attacks of nonsuppurative thrombophlebitis the possibility of further attacks must be seriously considered in regard to acceptance for life insurance or insurance against illness. It has been suggested that some of the supposed embolisms in thrombophlebitic patients are really concurrent foci of thrombophlebitis in the lungs, brain, mesentery, kidneys and elsewhere. This interpretation, however, requires substantiation. In a case cited by the authors there were repeated pulmonary embolisms. In such cases operative treatment is not free from danger. Nodular thrombophlebitis may form part of the clinical picture of thromboangiitis obliterans, as in the case of a Russian Jew, aged 66 years, in whom the symptoms of thrombo-angiitis obliterans commenced at the age of 38. In this case the disease progressed by exacerbations with long periods of quiescence and finally all active signs of the disease disappeared. This occurrence affords strong evidence in favor of the disease being due to an infective or toxic agent, and being quite distinct from degenerative arteriosclerosis and arteriolosclerosis. The superficial inflammatory nodules, which constituted episodes in the course of the thrombo-angiitis obliterans, may be interpreted as representing Buerger's disease when it attacks superficial venules and possibly capillaries and the minutest arteries. Their presence is probably occasionally of some value in regard to differential diagnosis.—*Practitioner*, April, 1932, cxxviii, 4.

A Method of Increasing the Specific Resistance of a Syphilitic Individual to His Disease.—Charles H. Dennie reminds us that the chemical treatment of syphilis has changed but

little during the past twenty years, and that we do not as yet know a successful treatment for this disease. The arsenamines, mercury and bismuth, modified by some protoplasmic body substance, have a direct action upon *Spirocheta pallida*. When one uses these drugs, one is attempting to destroy the cause of the disease. The defense of the body against syphilis probably lies in the reticulo-endothelial system. The malarial plasmodium stimulates the reticulo-endothelial system and thus raises the resistance of the individual to his disease. With this agent the aim is to hold the disease in check. All of our knowledge of the action of the malarial plasmodium has been drawn from the action of this agent upon the paretic. Simple deduction leads to the belief that this action would not be specific for paresis alone. The same phenomenon should take place in constructive bone and joint lesions, in resistant skin manifestations, in interstitial keratitis, and in enlarged liver and spleen, in fact in any syphilitic lesion which has not passed beyond the stage of resolution. The author made radiographic and photographic studies of constructive syphilitic lesions in patients who were under malarial treatment and was able to demonstrate that bone lesions of recent origin, interstitial keratitis, and resistant skin lesions would heal under malarial therapy. He found that Wassermann negative cases with cutaneous lesions may become Wassermann positive following malarial therapy. The benefit obtained from malarial therapy is not maintained unless antisyphilitic treatment is immediately instituted. As soon as an individual has recovered from the effects of the malaria, he should receive energetic treatment with the arsenamines, mercury, bismuth and the iodides, unless there are contraindications to the use of these drugs. This applies whether the patient is a paretic, a tabetic or has some form of somatic syphilis.—*Southern Medical Journal*, May, 1932, xxv, 5.

Analysis of Reports of 8,354 Cases of Impf-Malaria.—William Krauss has endeavored by means of a questionnaire to obtain data in regard to impf (inoculated) malaria upon which to base a discussion of malaria as modified by the "impf" (vaccination) method, in the one hand, and by the pathological individual, the paretic, on the other hand. Reports were received from 52 institutions in 24 States. The death rate for the entire series was 5.38, but varied in different groups from 24.63 to 2.2 per cent. In a total of 5,652 inoculations 89.13 per cent were successful. Generally speaking, good results have been shown under all conditions of transfer. The answers to

the questions as to the number of paroxysms allowed showed an average of perhaps 15, while in individual reports they ran as high as 32 or "as many as they will have." No seasonal influence upon successful inoculations was observed. No successful method of reducing impf-malaria to the tertian periodicity has as yet been developed. Relapses appear to be extremely uncommon. This is in striking contrast to the experience of the British, using *Anopheles malaria*. The questionnaire, as regards fatal cases, included questions as to age, sex, physical risk, and season of the year, none of which was believed to have any bearing except extreme age. The number of paroxysms before death varied greatly. Some died after the first, second, or third chill. The causes of death mentioned most often were circulatory collapse and convulsions. Other causes given were hyperpyrexia, albuminuria, vomiting, gastro-intestinal disturbances, and hemorrhage. In order to guard against severe reactions and fatalities Krauss urges prompt recognition of premonitory symptoms and the desirability of a daily check on the number of parasites. He discusses the influence of massive infection and of a too-prolonged course of malaria upon the death rate. It is important to have patients cared for in a perfectly organized hospital by someone who understands malaria and has the benefit of consultation with an expert malariologist. As to the selection of cases for the sake of a lower mortality, patients should not be deprived of the benefit of treatment, as surprising results have been seen in desperate cases. Extreme weakness and galloping paralysis are contraindications to the treatment. There is unmistakable evidence of refractoriness to inoculation among residents in the South and in malarious districts. Negroes are less susceptible to inoculation than whites.—*Southern Medical Journal*, May, 1932, xxv, 5.

Etiology of Psychic Manifestations in Thyroid Disease.—E. O. Houda, writing in the *Schweizerische medizinische Wochenschrift* of April 9, 1932, says that the literature throws no direct light whatever upon the cause of the psychoses of thyroid disease. "With no fear of contradiction, one can say that hyperthyroidism is not the immediate cause of mental imbalance. Thyroxin and thyroid extracts have never induced more than keener cerebration and increased metabolism. When insanity appears months after surgical removal of toxic goiter, one may justly question whether thyroid secretion *per se* has anything whatever to do with its appearance. More iodine than even normal thyroids ever do need and more than diseased ones can be made to use is available everywhere. Through nature's universal distribution of naturally excessive iodine, it is in large part treated as excess and as quickly eliminated as adsorbed essentially from foods. Goiter unquestionably is

thyroid pathology. Like every etiologically determined pathological tissue, it contains a common denominator necessary to its pathology. Microorganisms are now demonstrable in all endemic goitrous tissues, and in the serum readily obtained from them on surgical removal; also in the serum obtained from the drainage after surgical removal. A special method, not yet in general vogue, is necessary to cultivate them, which can be done with monotonous regularity. Inoculation of rabbits produces thyroid disease in each instance, from which the same organisms are recovered. This micrococcus has been cultivated by all who have duplicated the method, and its presence has received abundant confirmation. Clinically effective responses to goiter vaccine have been proved during several years of the author's personal and original use, in treatment of all types of endemic goiter. The two singular results obtained by its use in the treatment of the first two mental cases are regarded as therapeutic tests not only of the value of this vaccine but also of the validity of a now-established infectious hypothesis for goiter in general. In both cases outlined by the author the first injection of the vaccine was followed by a violent mental reaction, while no reaction at all followed subsequent injections. Both patients shortly afterwards recovered completely and were able to resume their usual activities in life. The method of culture of the goitrogenous micrococci is outlined by Houda.

Oscillatory Desiccation in the Treatment of Accessible Malignant Growths and Minor Surgical Conditions.—In *Physical Therapeutics*, April, 1932, 1, 4, the editor publishes, with the permission of the author, the original epoch-making essay upon "Desiccation," read by William L. Clark before the American Electrotherapeutic Association in 1910. The conclusions reached at that time have since been shown to be true. This paper was based on an experience of 317 lesions in 78 patients treated by this method. Desiccation, as produced by a current from a static machine of large output with properly connected and attuned accessories, when applied with correct technique and care, is capable of producing superficial or deep destruction of any accessible tissue, whether normal or neoplastic, resulting in disintegration of the cells, thus permanently devitalizing them. Desiccation has sterilizing, deodorant, and styptic properties. In order to test the bactericidal properties of the current, cultures taken from an ulcerating carcinoma of the pharynx were examined and showed the presence of *Streptococcus pyogenes* and *Micrococcus aureus*. Cultures taken from the same area after treatment showed no bacterial growth. Desiccation also stimulates surrounding untreated tissue to rapid repair. It has no particular affinity for abnormal tissue over the nor-

mal, but it is not difficult to keep the destruction well within proper bounds, owing to the refinement of its control. Desiccation is applicable to all accessible lesions where a lethal action is desired, and it operates from without inward. Malignant growths on cutaneous surfaces and mucous membranes may be destroyed by this procedure without opening up blood or lymph channels, and thereby the likelihood of metastasis or of inoculation of healthy tissues with malignant cells is lessened. On the first appearance of recurrence of cancer of the breast (after operation) there is a possibility of arresting and controlling the disease if desiccation is employed. In cancer of the cervix desiccation is a more desirable treatment than the curette and cautery. It penetrates more deeply beneath the surface than cauterization, and at the same time has a styptic and deodorant effect. It is most effective in exuberant granulations. Clark expressed the belief that desiccation would be effective in trachoma, and for tonsillectomy, and that by employing endoscopes of various types it could be applied to lesions in body cavities. These expectations have been verified, except in the case of the stomach. Old pus sacs may be entered and destroyed by desiccation, as for example in pustular acne, furunculosis, and carbuncles. The cosmetic effect after desiccation is better than after destructive fulguration.

The Treatment of Bronchial Asthma—For a subject to become asthmatic, say M. Pehu and J. Valin, a modification of an unknown nature must be produced within him which creates what is known as a "soil." For this reason two kinds of medication are needed, one addressed to the symptom, the other to its probable cause. The latter must be employed during the period intervening between the paroxysmal "crises." During the crisis the medicaments employed are chosen for their action upon the vago sympathetic system, and consist of adrenaline, ephedrine, belladonna and atropine. At the present time, adrenaline hydrochloride 1:1000 or 1:2000 is the remedy chiefly indicated because of its excitatory sympathetic action, which causes cessation of the bronchial spasm resulting from paresis of the sympathetic which in its turn produces increased tonus of the pneumogastric. With adrenaline may be combined extract of posterior lobe of hypophysis. The sedative effect of levorotatory hyoscyamine administered by intramuscular injection in dosage of 0.5 mg. may be utilized advantageously. Morphine continues to be indispensable in certain cases where all other remedies fail. Amyl nitrite, ethyl iodide, and pyridine may be given by inhalation. Other valuable medicaments to which recourse may be had are benzyl benzoate, veronal, valerian, and the bromides and iodides. Venesection with withdrawal of 20 to 500 c.c. blood is sometimes useful. Bi-

lateral paravertebral injections of novocaine between the first and fourth dorsal vertebrae have given relief in some cases. In inveterate cases biliary drainage by the duodenal tube has been employed with good results. Treatment between the attacks is more difficult, since bronchial asthma is not a uniform disease and a medication that succeeds in one case may fail in another. It is necessary to try to find out upon which apparatus the disturbance bears most heavily (liver, endocrine glands, the neurovegetative system). Often one is forced to grope in the dark, for slight troubles not readily revealed. It must also be emphasized that whatever the treatment, it must be followed up for a long time before one concludes that it is without efficacy. Methods that may be effective consist in the administration of iodine, arsenic, nervines, opotherapy, antiarthritic and eupeptic remedies, specific or nonspecific desensitization, physical agents (radiotherapy, diathermy, ultraviolet rays), climatotherapy and crounotherapy. In some cases even surgical interventions upon the appendix, the genital organs, or spleen have been of use. Perseverance and persistence in these efforts must be prolonged if they are to be effective.—*Journal de médecine de Lyon*, April 15, 1932.

Acute Anterior Poliomyelitis—In an experience with ninety patients suffering from the "bulbar" and high spinal types of poliomyelitis, James L. Wilson has developed a program for the symptomatic treatment of the various types of respiratory disturbances by the use of the Drinker respirator. Clinically it has been possible to distinguish in this group of patients three mechanisms by which respiratory failure has been brought about, namely, (1) paralysis of the intercostal muscles or of the diaphragm, (2) in patients with pharyngeal paralysis, excessive fatigue caused by continual interference with inspiration of unswallowed material in the pharynx or to actual aspiration of this material, and (3) direct involvement of the respiratory centers. Of 23 patients with paralysis of the respiratory muscles treated with the Drinker respirator, three died, all of pneumonia. Features believed to be of great importance in the treatment of these patients were (1) Early, uninterrupted, and prolonged use of the respirator, to avoid dyspnea or fatigue, especially in the acute stage of the disease, (2) painstaking care of the patients in the respirator in respect to frequent change in position, cleanliness of the skin, care of the bowels, and in patients who also had pharyngeal paralysis, postural drainage and the parenteral administration of fluids. There were 40 patients with undoubted pharyngeal paralysis. In the treatment of this group the therapeutic details of greatest value were (1) Avoidance of vomiting by keeping the stomach empty during the febrile period and until hunger returned, (2)

postural drainage; (3) aspiration of the throat; (4) adequate administration of fluids parenterally, and (5) in a few selected cases tracheotomy. Twenty patients with probable involvement of the respiratory centers or with sudden respiratory failure following an attack of choking were treated in the Drinker respirator. Of these, thirteen died. It is believed that the respirator was an important factor in the survival of the others. The author emphasizes the fact that the use of the respirator in poliomyelitis with respiratory muscle paralysis should not be regarded as a method to be employed only as a last resort. It should be considered as a method of giving needed relief and rest to any patient with weakness of the muscles of respiration.—*New England Journal of Medicine and Surgery*, April 28, 1932, ccvi, 17.

Effort Thrombophlebitis.—J. Cottalorda, writing in the *Lyon chirurgical* of March-April, 1932, undertakes to establish a more rational pathogenesis of effort thrombophlebitis than is offered by the two classic theories of a purely traumatic or of an infectious origin, neither of which is entirely satisfactory. This affection, which is met most usually in the right upper extremity, and which attacks males almost exclusively, may be observed after either sudden effort or chronic strain. In most cases the edema appears immediately or a few hours after the initial accident, but there are cases in which the subject awakes in the morning to find an edema when no special effort has been experienced. An impressive fact is that the coagulum found in the majority of cases is not constant. In one of the author's cases in which the entire syndrome was present, with its edema, functional impotence, collateral circulation, and venous cord, positively no coagulum could be demonstrated. The multiple vascular troubles present, and the importance of vasomotor disturbances of a sympathetic type at a distance, lead Cottalorda to the following theory of pathogenesis: The sudden and violent, or the repeated, traumatism causes a perivenous irritation, perhaps most frequently as the result of a tearing of venules or through contusion of abnormal anatomical elements. This contusion then produces a perivenous adventitial irritation which induces venospasm. This may be only intermittent if the cause of the irritation ceases to act or diminishes below the threshold of excitation of the sympathetic. But if this spasm becomes permanent, it produces stasis and favors the formation of a coagulum, especially when the venous endothelium has been changed by the traumatism or possibly by a latent perivascular infection manifested by an infected hematoma or by chronically inflamed ganglia. In any case, infection cannot play more than a secondary role, and the essential element is the venous spasm. Effort thrombophlebitis may accordingly be de-

fined as a syndrome characterized by vascular lesions, predominantly of the veins, whose point of departure is a venous spasm due to sympathetic irritation, and which are generally, but not necessarily, accompanied by venous thrombosis, and betrayed clinically by edema, which is the exteriorization of the vasomotor disequilibrium of the limb. Treatment should be surgical, if a brief expectant medical treatment fails to bring relief after a few days in which the sphygmomanometric readings are closely watched. It should consist of phlebectomy and periarterial sympathectomy of the corresponding artery.

The Insulin Method of Increasing Weight in Thin Patients.—Louis H. Nahum and H. E. Himwich, writing in the *American Journal of the Medical Sciences*, May, 1932, clxxxiii, 5, state that it is not generally appreciated that insulin plays an important rôle in the hunger-producing mechanism. After referring to experimental work in animals which has afforded evidence that insulin has a definite influence on the hunger mechanism, they report four cases in which thin patients, otherwise normal, gained weight rapidly while receiving subcutaneous injections of insulin. The first patient gained 22½ pounds in twenty-eight days, the second gained 10 pounds in twelve days, the third 12½ pounds in twenty-three days, and the fourth gained 15 pounds in thirty-nine days. The treatment was begun by administering 3 units of insulin every three hours. The dose of insulin was gradually increased until 10 units or even larger doses were injected every three hours. The patients were urged at all times to have available carbohydrates in case of an insulin reaction. Untoward reactions, however, were very few considering that from 45 to 65 units of insulin were administered daily to normal persons. As a result of the treatment, there was a great increase in the appetite, probably a considerable enlargement of stomach capacity, and the generation of great pleasure associated with eating. The gain in weight was not due to water retention, as the caloric intake was doubled and tripled during the treatment and the patients maintained their gain in weight for the most part after the discontinuance of treatment. The authors discuss the relation of mental states to anorexia and trace their influence upon the insulin mechanism. It has long been known that patients subjected to worry and anxiety quickly lose the appetite and grow thin. That the mind may mediate these effects through the insulin mechanism gains support from the work of Beattie, Brown, and Long (1930), who have traced anatomic pathways from the hypothalamus to the sympathetic nerve fibers in the cord. It is known that adrenaline tends to inhibit insulin activity, and it is therefore not difficult to understand how emotional states may interfere with the insulin mechanism and so diminish appetite.

LEGAL

LIBEL—DEFAMATORY STATEMENTS CONCERNING DECEASED PERSONS

By LORENZ J. BROSNAN, Esq.

Counsel, Medical Society of the State of New York

Every year biographies are published that are so bold in their delineation of the characteristics, weaknesses and vices of their subjects that one is led to wonder just how far a writer is entitled to go in writing biography before he will run into some legal restraint. Statements circulated in such biographies are bound to offend the sensitive and sentimental. The descendants of the subject may be caused great embarrassment, and even direct financial loss. If the publication is untrue the injustice caused by the free publication of a libelous biography becomes apparent.

Recently an action was instituted in one of the states in the Southwest against a widely circulated magazine that had published a biographical sketch of one of the popular heroes of the early days of that part of the country. The article falsely imputed that the subject had been the father of an illegitimate child. One of his descendants sued to recover damages and a large verdict was awarded by a jury. An appeal was taken to the Federal Circuit Court, but before the appeal had been decided, the defendant settled the case, thus preventing a decisive ruling on the question by an appellate court. The tendency, however, has been for courts to rule that civil actions for damages may not be brought based upon libel of the dead. In England and France civil actions brought by descendants of famous people against their biographers have recently failed to be sustained. It will be interesting to note the outcome if some case brought by descendants of illustrious dead to recover damages is bitterly contested to obtain an adjudication in one of our courts.

Of course, the publication of matter defaming the memory of the dead is not wholly unrestrained by law. Whether an action at civil law for damages may be maintained or not, the criminal law here acts as a curb. Even at common law, which forms our fundamental law in the absence of statute, libel of the dead was a crime punishable as a misdemeanor. The punishment of said crime, however, was obstructed by the technical requirements that to constitute a punishable offense the libel must have been published with the malevolent purpose to injure the family and posterity of the deceased, and must have tended to cause a breach of the peace. Deliberate intent to

injure the family of the deceased was punished in order to prevent members of the family from taking the law into their own hands to avenge the defamatory statements.

Statutes in many of the states have been enacted which more adequately deal with the offense than the old common law. The section from the Penal Law of our state which governs is as follows:

"Sec. 1340. Libel defined. A malicious publication, by writing, printing, picture, effigy, sign or otherwise than by mere speech, which exposes any living person, or the memory of any person deceased, to hatred, contempt, ridicule or obloquy, or which causes, or tends to cause any person to be shunned or avoided, or which has a tendency to injure any person, corporation or association of persons, in his or their business or occupation, is a libel."

Some years ago under such a statute in a western state an article regarding George Washington was published in a newspaper. It was charged in an information that the defendant had composed and published the article so as to expose Washington's memory to hatred, contempt, and obloquy. In a jury trial it was determined that the matter published constituted an offense under the statute, and judgment and sentence were imposed. An appeal was taken and the principal contention was made that the facts charged did not constitute the offense of libel, for the language complained of related to a person who had been dead for a period reaching back prior to the birth of any person living, and that no claim was made by the prosecution that any relatives or posterity of Washington were injured by the publication. The Appellate Court affirmed the conviction and said:

"We conclude that the reasons of the common law are no longer controlling, and that under this new statutory definition of the offense it is not a question of whether the memory of the deceased is defamed to the injury of his living relatives and friends to the end that they be not provoked to breaches of the peace, but it is simply a question of whether or not the libelous publications tended 'to expose the memory of one deceased to hatred, contempt, ridicule or obloquy.' If such is the tendency of this publication and it was maliciously made we see no escape from the conclu-

sion that the act was an offense within the meaning of this new Statute. If it be necessary to look for a reason permitting the legislature to thus broaden the definition of the offense we may well presume that it can be found in the conclusion of the legislature, which clearly is within the bounds of reason, that all publications tending to defame the memory of deceased persons might have the tendency to excite some persons to breaches of the peace, whether they be relatives or friends of the deceased or others who may have a high regard for the deceased, though such regard rest only upon traditional or historical knowledge."

It has been urged as a defense to criminal proceedings to punish for libelous statements concerning the dead that the doctrine of freedom of the press prevented conviction. The First Amendment to the United States Constitution prevents Congress from abridging the freedom of speech or of the press, and the highest Court of the land has decided that the Fourteenth Amendment protects against unfair restraints on free speech and

a free press by state laws. However, these constitutional guarantees have not been interpreted to permit unchecked abuses of the freedom of the press. As one court said:

"It is well to notice that the liberty of speech and press are guaranteed alike in this section of the bill of rights; that which a man may write with impunity, he may speak with impunity; what may be published in the columns of a newspaper, may be proclaimed from the hustings, the pulpit, or the lecture platform; that the liberty of the press is and should be no more sacred than the liberty of speech. While the liberty of each is a sacred right, dear to the hearts of an entire Anglo-Saxon civilization, yet the law makers and the framers of the Constitution have all realized that liberty in the exercise of any natural right, when unrestrained by law leads to licentiousness, and have therefor wisely provided that anyone exercising the liberty of speech or of the press within this State shall be held responsible for an abuse of such privilege."

TREATMENT OF PERITONSILLAR ABSCESS

A doctor engaged in the general practice of medicine was summoned to attend to a woman who was suffering from a throat condition.

The doctor examined the patient and found an acute condition of right peritonsillar abscess. He ordered an ice bag to the throat and directed that she gargle with alkaline antiseptic tablets and take aspirin and a cathartic.

Two days later he was again called in and found that her condition had not improved. He discontinued the cold applications and substituted heat treatment to the throat. The doctor saw her each day thereafter for four days. At the end of that time her condition had not improved, but there was swelling and edema of the throat and she was unable to take nourishment. The doctor directed that she enter a nearby hospital in order that he might open and drain the abscess under an anæsthetic at the said hospital. The patient entered said hospital and the doctor had her put under an ether anæsthetic and removed a section of the upper pole of the right palatine tonsil, reaching the abscessed cavity with very little hemorrhage. The condition of the pus was such that the abscessed cavity was curretted to remove necrosed material. The left tonsil was not disturbed in any way, as there was no evidence of infection therein. Following the operation her condition rapidly improved and she was able to return to her home in three days.

Three weeks later the patient returned to the doctor's office, at his request, and an associate of

the doctor, under his instruction, removed the remainder of the right tonsil under local anæsthesia. It was not possible at that time to remove all the tissue by dissection and snare due to the thickness of the capsule as a result of the inflammation therein. A few diathermy treatments were administered to her and it was understood between the doctor and the patient that she was to return for further treatment, but she failed to do so because of other illness in her family. She never returned to the doctor for further treatment.

The doctor undertook to collect his fee for services and was obliged to resort to the institution of a law suit for that purpose. An answer was interposed on behalf of the defendant, claiming that the services rendered by the doctor were wholly without value and further stating as a counterclaim that the treatment rendered by the doctor was negligent and unskilled and as a result the defendant was rendered sick and disabled for a long period of time and was obliged to expend large sums of money for treatment and medicines.

The action was brought on for trial and the patient introduced considerable testimony with respect to the pain and suffering which she went through, but failed to introduce competent medical proof that the practice followed by the doctor in the case was a departure from proper and approved practice. A decision was rendered by the court in favor of the doctor for the full amount of his bill, and dismissing the counterclaim.

CLAIMED FAILURE TO REMOVE GALLSTONES

In this case a surgeon was called to a hospital by the family physician of a patient to examine her with respect to the advisability of an operation. The family physician advised the surgeon that the patient, a middle aged woman, had had gallbladder attacks for about twenty years and that she had a long-standing chronic nephritis, her urine containing albumin and pus, that she had had high blood pressure for many years and, although the pain in the gallbladder region had been severe, she had not consented to any operation until they became so severe that she could not stand it. The doctor examined the patient, found that she was about four and a half feet high and weighed about two hundred forty pounds, that at that time her blood pressure was systolic 190, diastolic 90. The doctor's diagnosis was chronic cholecystitis with adhesions. Because of the patient's condition, namely, blood pressure and the various other conditions, he thought that the patient would not survive an operation at that time. The doctor, therefore, advised absolute rest so as to improve her condition, in other words, to build her up for the operation.

About ten days later the doctor performed an operation upon the plaintiff. Her blood pressure at that time was 210/110. He made an incision on the right side of the upper abdomen which was distended, opened the gall bladder and duct, and thoroughly explored and drained the same. There were no gallstones present. The surgeon found and drained a large amount of dark bile and permitted a drainage tube to remain in the patient for about two weeks subsequent to the operation. The patient was discharged from the hospital about three weeks after the operation, in good health so far as the operation was concerned, but there had been no improvement in her kidney condition.

The patient thereafter called at the doctor's office on several occasions complaining of attacks of dizziness and a discharging sinus. Examination showed the presence of a discharging sinus with a small amount of mucus. The

surgeon gave her no treatment but referred her to the family physician. No further operation was ever requested by either the patient or her family physician.

About four years after the operation, the doctor received a call to visit the patient at her home to see a concretion which was said to have come through the fistula which had never healed. The doctor examined the substance, but was unable to say whether or not it was a gallstone or whether it had come through the fistula. This was the last time the doctor ever saw the patient.

An action was thereafter instituted against the surgeon, claiming that he had negligently operated upon the patient in that he failed to ascertain the presence of gallstones and to remove them, and further that by reason of his negligence the incision which he had made failed to heal and for upwards of four years caused her to suffer from an open sloughing sore. The plaintiff's complaint further charged that by reason of the negligence of the defendant her blood pressure had become increased and accelerated, so that about three years after the operation the plaintiff sustained a cerebral hemorrhage which caused the left side of her body to be wholly paralyzed.

The defendant's answer, in addition to denying all allegations of negligence, set up the special defense that the action was not commenced within the statutory period. The case came on for trial, and at the conclusion of the testimony which required three days to put in, the defendant's attorney moved for a dismissal of the complaint on the ground that the plaintiff had failed to establish a cause of action. The motion was granted by the court.

An appeal was taken on behalf of the plaintiff, but before the appeal could be argued the plaintiff died. A motion was thereupon made to dismiss the appeal on the ground that the action abated by reason of the death of the plaintiff. Said motion was granted, thus finally terminating the case in favor of the doctor.

NEWS NOTES

THE EXECUTIVE COMMITTEE MEETING, JUNE 16, 1932

The Executive Committee of the Medical Society of the State of New York held its regular monthly meeting on Thursday, June 16, 1932. The personnel of the Committee as completed by the Council on May 24, 1932, in accordance with the By-laws, Chapter 5, Section 1, is as follows:

Dr. Chas. Gordon Heyd, President, New York.
Dr. John A. Card, Speaker, Poughkeepsie.
Dr. Daniel S. Dougherty, Secretary, New York.
Dr. Frederic E. Sondern, Treasurer, New York.
Dr. William D. Johnson, Past-President, Batavia.
Dr. Frederick H. Flaherty, Syracuse.
Dr. Charles D. Kline, Nyack.
Dr. Arthur J. Bedell, Albany.
Dr. Louis A. Van Kleeck, Manhasset.
Dr. James M. Flynn, Rochester.

The Executive Committee completed the list of members of the Committees, both the Standing and the Special.

STANDING COMMITTEES

The Chairmen of the Standing Committees are elected by the House of Delegates according to Chapter 10, Section 8 of the By-laws. The list of the Chairmen elected at the last meeting of the House of Delegates is published on the first editorial page of each issue of the JOURNAL. The Executive Committee appointed the other members of the Standing Committees, on their nomination by President Heyd. The personnel of the Standing Committees is now as follows:

COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION:

Dr. Thomas P. Farmer, Chairman, Syracuse.
Dr. George W. Kosmak, New York.
Dr. Mahlon H. Atkinson, Catskill.
Dr. Leo F. Schiff, Plattsburg.
Dr. William A. Groat, Syracuse.
Dr. Martin B. Tinker, Ithaca.
Dr. Clayton W. Greene, Buffalo.
Dr. Edward G. Whipple, Rochester.
Dr. Nellis B. Foster, New York.

COMMITTEE ON PUBLIC RELATIONS

Dr. James E. Sadlier, Chairman, Poughkeepsie.
Dr. William H. Ross, Brentwood.
Dr. George M. Fisher, Utica.
Dr. O. W. H. Mitchell, Syracuse.
Dr. Augustus J. Hambrook, Troy.
Dr. William D. Johnson, Batavia.
Dr. Thomas H. Cunningham, Glens Falls.

COMMITTEE ON MEDICAL ECONOMICS

Dr. Charles H. Goodrich, Chairman, Brooklyn.
Dr. Frederic E. Elliott, Brooklyn.
Dr. Joseph P. Garen, Olean.
Dr. Frederick M. Miller, Utica.

Dr. Homer L. Nelms, Albany.
Dr. Joseph C. O'Gorman, Buffalo.
Dr. Cassius H. Watson, New York.
Dr. Terry M. Townsend, New York.
Dr. Frederick S. Wetherell, Syracuse.
Dr. Edward R. Cuniffe, Bronx.

COMMITTEE ON LEGISLATION

Dr. Harry Aranow, Chairman, Bronx.
Dr. John J. Buettner, Syracuse.
Dr. Bernard B. Berkowitz, Brooklyn.
Dr. B. Wallace Hamilton, New York.
Dr. Edward E. Haley, Buffalo.

SCIENTIFIC WORK:

(The Committee on Scientific Work consists of the chairman, elected by the House of Delegates, the chairmen of the scientific sections, and one member elected by the Council—By-laws, Chapter 10, Section 2.)

Dr. Arthur J. Bedell, chairman, Albany.
Dr. Edward C. Reifenshtein, Syracuse.
Dr. Edward R. Cuniffe, Bronx.
Dr. Edward C. Hughes, Syracuse.
Dr. Brewster C. Doust, Syracuse.
Dr. Davis F. Gillette, Syracuse.
Dr. Daniel R. Reilly, Cortland.
Dr. Henry W. Williams, Rochester.
Dr. Paul E. Bechet, New York.
Dr. Frederic E. Sondern, New York.

ARRANGEMENTS:

Dr. Samuel J. Kopetzky, Chairman, New York.
(The other members will be chosen later.)

SPECIAL COMMITTEES

The Executive Committee appointed the following Special Committees:

COMMITTEE ON MEDICAL RESEARCH:

Dr. Frederic E. Sondern, Chairman, New York.
Dr. John Wyckoff, New York.
Dr. S. R. Detwiller, New York.
Dr. George Baehr, New York.
Dr. G. Canby Robinson, New York.
Dr. Augustus B. Wadsworth, Albany.
Dr. Edwin M. Stanton, Schenectady.
Dr. Herman G. Weiskotten, Syracuse.
Dr. John J. Morton, Rochester.
Dr. Winfield W. Scott, Rochester.
Dr. Burton T. Simpson, Buffalo.
Dr. F. A. Hartman, Buffalo.
Dr. James L. Gallagher, Buffalo.
Dr. Simon Flexner, New York.
Dr. Peyton Rous, New York.

PRESS PUBLICITY:

Dr. Alec N. Thomson, Chairman, Brooklyn.
Dr. Edward C. Podvin, Bronx.
Dr. James N. Vander Veer, Albany.
Dr. Louise W. Beamis, Buffalo.

PRIZE ESSAYS

Dr Henry H M Lyle, Chairman, New York
Dr Martin Cohen, New York
Dr Joshua C Sweet, New York

COORDINATED ACTIVITIES

(The Committee was authorized by the House of Delegates by resolution as follows: The Council be instructed to prepare for publication not later than December 15, 1932 a program of action by the Committees of the Society to further cooperation and coordination of activity and to make the collective thought of the State Society effective and powerful and to encourage the work of its committees. —JOURNAL June 15 page 752)

Dr Frederick H Flaherty, Chairman Syracuse
Dr Charles D Kline, Nyack
Dr Louis A Van Kleeck, Manhattan

It was decided to hold the next Annual Meeting of the Medical Society of the State of New York in New York City at the Waldorf-Astoria Hotel. The date of the meeting was left to the decision of the President, the Secretary, and the Chairman of the Committee on Arrangements

Dr Frederick H Flaherty, President elect, was appointed ex-officio member of the Executive Committee of the State Charities Aid Committee on Tuberculosis and Public Health

Mr Lorenz J Brosnan was reappointed Counsel, and Mr Thomas H Clearwater, Attorney

Dr Eugene F Traub was granted permission to publish his paper on "Squamous Cell Epithelioma of the Skin of the Face" in the *Archives of Dermatology* provided that due credit is given that it had been read at the Annual Meeting of the Medical Society of the State of New York

Dr Kenneth M Lewis was granted permission to publish his paper on "Antitoxin Treatment of Erysipelas" in the *Journal of the American Medical Association*, provided that due credit is given that it had been read at the Annual Meeting of the Medical Society of the State of New York

DANIEL S DOUGHERTY, Secretary

THE BUDGET

The following budget of the Medical Society of the State of New York, for the year July 1,

1932, to June 30, 1933, was adopted by the Trustees on June 24, 1932

GENERAL

	Appropriation
Rent	\$ 2,900 00
Telephone	200 00
Postage	900 00
Stationery and Printing	1,000 00
Salaries	18,600 00
Contingent Fund	1,000 00
Annual Meeting—Printing, Postage and Stenographer for House of Delegates	2,500 00
Printing District Branch Programs and Postage for mailing paid through Secretary's office	800 00
Auditor	500 00
Traveling Expenses—General Including President and Secretary	3,000 00
Traveling Expenses, A M A Delegates	2,000 00
Counsel—Salary	12,000 00
Counsel—Expenses	500 00
Secretary—Honorarium	3,000 00
Secretary—Expenses	500 00
Executive Officer's Salary	8,000 00
Executive Officer's Expenses	1,200 00

STANDING COMMITTEES

Legislation	\$ 5,000 00
Medical Economics	2,000 00
Public Health and Medical Education	8,000 00

THE DAILY PRESS

Reg'lar Fellers

In and Out the Window

By Gene Byrnes

From New York Herald Tribune, January 6, 1932

THE WORLD OF MAKE BELIEVE

Children are encouraged to use their imaginations, and to compose imaginary stories based on real life. It is not surprising that sometimes memories of the make believe are confused with the real. The *New York Times* of June 17 records such an incident as follows

"More than twenty policemen of the Bayside Precinct in Queens, including both uniformed men and detectives, reinforced by a police emergency squad and more than 400 other men and women, spent a busy hour and one half late yesterday investigating a kidnapping alarm which proved, while the search for a supposedly missing child was still in progress, to be the figment of a childish imagination

"The futile search began when Claire Gormley, 7 years old, reported to a man she met in the street that her little friend, Rita Celinski, 8 years old, had been kidnapped by a Negro

"Claire notified Lieutenant William Dooley of

the Bayside Precinct, who sent for an emergency squad and also dispatched twenty of his uniformed men and detectives to search the woods. Claire's story was corroborated by a playmate, Faith Nicholson, also 7 years old

"The arrival of the police cars sent the neighborhood into an uproar. More than 400 men and women hurried to join the policemen in the search. While the hunt for Rita was still going on Rita came home at about 6 P. M. The police, who had been keeping in constant touch with Rita's home, called the search off

"Detective William Benecke questioned Claire, but she tearfully declared that she could give no reason for conceiving the kidnapping story. The Nicholson girl said she had supported Claire's story because her friend would get in trouble otherwise. Claire's parents promised the police that they would deal with their daughter in the approved manner when they took her home"

AUTOPSIES ON PHYSICIANS' BODIES

The death of Dr. William W. Keen of Philadelphia, on June seventh, was noticed in the *New York* daily papers. The *New York Times* of June 9 said editorially

"Dr. William Keen, who died at the age of ninety-five, was one of the country's most distinguished surgeons, though perhaps better known to the laity as the man who could keep for a quarter of a century the secret of the operation upon President Cleveland in the dark and nervous

days of 1893. A surgeon during the Civil War, a writer, a staunch churchman yet a believer in evolution, and a lifelong defender of vivisection, he should also be remarkable to this generation as a witness of nearly all the great battles fought by medicine to reach a state of public health which we now take for granted"

The *New York Herald Tribune* of June 15 carried a news note of an unusual bequest in the will of Dr. Keen as follows

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review, as dictated by their merits, or in the interests of our readers.

PRIMARY CARCINOMA OF THE LUNG. Bronchiogenic Cancer. A Clinical and Pathological Study in Two Parts. By B. M. Fried, M.D. Octavo of 247 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1932. Cloth, \$5.00. (Medicine Monograph XIX.)

MEDICAL CLINICS OF NORTH AMERICA. Vol. 15, No. 5, March, 1932. (New York Number.) Published every other month by the W. B. Saunders Company, Philadelphia and London. Per Clinic Year (6 issues). Cloth, \$16.00 net; paper, \$12.00 net.

NUTRITION SERVICE IN THE FIELD. Report of the Subcommittee on Nutrition. LUCY H. GILLET, Chairman. CHILD HEALTH CENTERS: A Survey. Report of the Subcommittee on Health Centers. J. H. MASON KNOX, Jr., Chairman. LILLIAN LASER STRAUSS, Vice-Chairman. White House Conference on Child Health and Protection. Octavo of 139, 57 pages. New York, The Century Company (c. 1932). Cloth, \$2.00.

OBSTETRIC EDUCATION. Report of the Subcommittee on Obstetric Teaching and Education. FRED LYMAN ADAMS, M.D., Chairman. White House Conference on Child Health and Protection. Octavo of 302 pages. New York, The Century Company (c. 1932). Cloth, \$3.00.

GROWTH AND DEVELOPMENT OF THE CHILD. Part III. Nutrition. Report of the Committee on Growth and Development. KENNETH D. BLACKFAN, M.D., Chairman. White House Conference on Child Health and Protection. Octavo of 532 pages. New York, The Century Company (c. 1932). Cloth, \$4.00.

A CLINICAL STUDY OF THE ABDOMINAL CAVITY AND PERITONEUM. By EDWARD MEARIN LIVINGSTON, B.Sc., M.D. Quarto of 866 pages, illustrated. New York, Paul B. Hoeber, Inc., 1932. Cloth, \$15.00. (Hoeber's Surgical Monographs.)

EPILEPSY AND THE CONVULSIVE STATE. An Investigation of the Most Recent Advances. Parts 1 and 2. The Proceedings of the Association New York, December 27th and 28th, 1922. Editorial Board, FREDERICK TILNEY, M.D. and others. Octavo of 701 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1931. Cloth, \$8.00. (Association for Research in Nervous and Mental Disease. Vol. VII of a Series of Research Publications.)

SCHIZOPHRENIA [Dementia Praecox]. An Investigation of the Most Recent Advances. The Proceedings of the Association New York, December 27th and 28th, 1929. Editorial Board, GEORGE H. KIRBY, M.D. and others. Octavo of 246 pages, illustrated. Baltimore, The Williams and Wilkins Company, 1931. Cloth, \$4.00. (Association for Research in Nervous and Mental Disease. Vol. X of a Series of Research Publications.)

MANIC-DEPRESSIVE PSYCHOSIS. An Investigation of the Most Recent Advances. The Proceedings of the Association New York, December 29th and 30th, 1930. Editorial Board, WILLIAM A. WHITE, M.D. and

others. Octavo of 851 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1931. Cloth, \$10.00. (Association for Research in Nervous and Mental Disease. Vol. XI of a Series of Research Publications.)

PHYSIOLOGY OF BACTERIA. By OTTO RAHN. Octavo of 438 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc. (c. 1932). Cloth, \$6.00.

A CHILD'S BOOK OF THE TEETH. By HARRISON WADER FERGUSON, D.D.S. Second edition revised. 12mo of 106 pages, illustrated. Yonkers-on-Hudson, N. Y. World Book Co. [c. 1932]. Cloth, 68c.

HUMAN STERILIZATION. By J. H. LANDMAN, Ph.D., J.D., J.S.D. Quarto of 341 pages, illustrated. New York, The Macmillan Company, 1932. Cloth, \$4.00.

PRACTICAL TREATMENT OF SKIN DISEASES. By EDUARD AHLWEDE, M.D. Octavo of 770 pages, illustrated. New York, Paul B. Hoeber, Inc., 1932. Cloth, \$12.00.

DISEASES OF THE CORONARY ARTERIES. By DON C. SUTTON, M.S., M.D. and HAROLD LUETHI, Ph.D., M.D. Octavo of 164 pages, illustrated. St. Louis, The C. V. Mosby Company, 1932. Cloth, \$5.00.

HUMAN CANCER. By ARTHUR PURDY STOUT, M.D. Octavo of 1007 pages, illustrated. Philadelphia, Lea & Febiger, 1932. Cloth, \$10.00.

PULMONARY TUBERCULOSIS. By MAURICE FISHER, M.D. Fourth edition, thoroughly revised. Octavo, two volumes, totalling 1191 pages, illustrated. Philadelphia, 1932. Cloth, \$15.00.

MEDICAL CLINICS OF NORTH AMERICA. Vol. 15, No. 6, May 1932. (Mayo Clinic Number.) Published every other month by the W. B. Saunders Company, Philadelphia and London. Per Clinic Year (6 issues). Cloth, \$16.00 net; paper, \$12.00 net.

CLINICAL INTERPRETATION OF LABORATORY REPORTS. By ALBERT S. WELCH, A.B., M.D. Octavo of 366 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc. [1932]. Cloth, \$4.00.

THE COSTS OF MEDICINES. By C. RUFUS ROREM, Ph.D., C.P.A. and ROBERT P. FISCHER, B.S., Ph.D. Octavo of 255 pages. Chicago, The University of Chicago Press [c. 1932]. Cloth, \$2.50. (Publications of the Committee on the Costs of Medical Care: No. 14.)

THE HEALING CULTS. By LOUIS S. REED, Ph.D. Octavo of 139 pages. Chicago, The University of Chicago Press [c. 1932]. Cloth, \$2.00. (Publications of the Committee on the Costs of Medical Care: No. 16.)

LANG'S GERMAN ENGLISH DICTIONARY OF TERMS USED IN MEDICINE AND THE ALLIED SCIENCES WITH THEIR PRONUNCIATION. Fourth edition. Revised and edited by MILTON K. MEYERS, M.D. Octavo of 926 pages. Philadelphia, P. Blakiston's Son & Co., Inc. [1932]. Cloth, \$10.00.

BOOK REVIEWS

VARICOSE VEINS with special reference to the injection treatment. By H. O. MCPHEETERS, M.D., F.A.C.S. Third edition. Octavo of 285 pages, illustrated. Philadelphia, F. A. Davis Company, 1931. Cloth, \$4.00.

The third edition of this monograph has been enlarged over the previous editions so that we now have a 250 page exposition. This is not due so much to the addition of new subjects as to the elaboration of previously considered subjects. In a general way, the new edition fulfills the requirements of correctness of errors, more completeness of description and increased usefulness.

There are several points of importance that are considered by the author as proven that are not so regarded by other observers. The two outstanding examples are: first, the circulation of the blood in varicose veins and second, the uniformity of results which the author claims for the favored sclerosing substances. We still believe, despite his contentions, that the reverse flow of blood is not proven, that all sclerosing substances that are used in this therapy are inconsistent in the results which they yield.

The book is the best American treatise on the subject and as such deserves a place in the library of the physician or surgeon who attempts to practice the sclerosing of veins by the injection method.

ROBERT F. BARBER.

TEXTBOOK OF GYNECOLOGY FOR NURSES. By PHILIP REEL, M.D., F.A.C.S. Octavo of 282 pages, illustrated. Philadelphia, F. A. Davis Company, 1932. Cloth, \$2.50.

This book is written, as the author states, for "two types of nurses. The pupil nurse receiving instruction in Gynecology as a part of her general training, and the graduate who has chosen to prepare herself for hospital supervising or clinic nursing." The book adequately provides ample instruction for such nurses. Its chief accomplishment is the terse manner in which it describes gynecological conditions without dwelling upon details that are unnecessary from the nurses' viewpoint. The duties of the nurse are emphasized and her responsibilities clearly stated. The chapters on "Operating Room Equipment" and "Operating Room Personnel" while not strictly gynecological nursing are well written and are deserving of the space allotted to them. The information they contain is of value to the nurse to whom this book may be recommended.

WILLIAM C. MEAGHER.

THE PRACTICE OF CONTRACEPTION. An International Symposium and Survey. Edited by MARGARET SANGER and HANNAH M. STONE, M.D. Octavo of 316 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1931. Cloth, \$4.00.

The *raison d'être* of this book aside from the medical aspect of its contents, needs no better amplification than that embodied in the masterly foreword by Dr. Robert Latou Dickinson.

Margaret Sanger and her co-worker Dr. Hannah M. Stone deserve unstinted praise in acknowledgment of their monumental pioneer work.

Even those who have kept in touch with the educational crusade of Margaret Sanger, can only in part appreciate the many trials which she must have had to overcome before she could witness the fruition of her efforts—the Congress of Zurich, Switzerland in 1930.

The various contraceptive methods advocated by so representative a body must of necessity command respectful attention of those whose interest lies in this field. It would therefore be presumptuous for one to dogmatically advocate any one method to the exclusion of others. The interested reader will make his own choice. The reviewer ventures the opinion that while intra-uterine and other methods are still on trial, the one practiced by the Birth Control Clinic in New York, seems at least for the present the most universally adaptable one.

ADOLPH BONNER.

THE USE OF THE SELF. Its Conscious Direction in Relation to Diagnosis, Functioning and the Control of Reaction. By F. MATTHIAS ALEXANDER. 12mo. of 143 pages. New York, E. P. Dutton and Co., Inc., 1932. Cloth.

For many years Mr. Alexander has, by persistent study and untiring experimentation and observation, sought to develop a technique which will enable individuals really to secure the right use of themselves. In his book, "The Use of the Self," he has evolved this technique.

In an authoritative and scholarly manner Mr. Alexander demonstrates his new scientific principle with respect to human behavior, and the book may well be recommended to psychologists, psychiatrists and educators, as well as to workers in all fields of investigation pertaining to a study of human nature and conduct.

FREDERIC DAMRAU.

THE PRACTICAL MEDICINE SERIES. Comprising Eight Volumes on the Year's Progress in Medicine and Surgery. Series 1931. Chicago, The Year Book Publishers, 1931. General Medicine. Edited by GEORGE H. WEAVER, M.D., and others. 12mo. of 814 pages, illustrated. Cloth, \$3.00.

In this issue, as in others of this series, we find encyclopedic reviews of almost innumerable articles on medicine written during 1930-1931. While we find nothing revolutionary in the practice of medicine there are a few highlights which may be of interest to the practitioner.

Convalescent serum in the prevention of measles we are again told is effective—but for only a short time.

Scarlet fever antitoxin is in for a lot of praise when used in septic cases.

Diphtheria toxoid seems to be gradually replacing toxin-antitoxin in diphtheria prevention. There is also mention of glucose injections in the treatment of the active disease.

If we are to rely on what contributors have to tell us about poliomyelitis we should have a reliable remedy for that disease. We are told that "the serum is apparently effective and that the results are promising." But the words "apparently" and "promising" are not clarified. To the reviewer this seems like a juggling of words to hide one's ignorance.

As to smallpox, the physician is warned not to let up on his prevention propaganda for there are about 50,000 cases of this disease in this country every year.

For those who are fed up on calcium therapy for all sorts of conditions we are assured that for tuberculosis and hemoptysis it is "an excellent placebo."

In regards to Calmette's work on vaccination against tuberculosis we are advised that "an expectant attitude

toward tuberculosis vaccination is still the more reasonable."

Iron is in for another revival in the therapy of secondary anemia. How long it will last remains to be seen.

We read about the worthlessness of tonsil surgery in many types of cases hitherto regarded as thoroughly eligible for it. It is unfortunate that such opinions, however true, reflect the tendencies of the times rather than the personal opinions of the individual. The same holds true for digitalis therapy in lobar pneumonia.

We find encouraging reports and prognoses about dangerous 'high blood pressures.

If one were to search for positive discoveries in this annual compilation he will meet with little success. Case reports, confirmations, and controversies are all very interesting and valuable but they can hardly be classified under the heading of progressive medicine.

The editors of this book have done a fine piece of work in the quality of their reviews as well as of their occasional summary comments.

EVANUEL KRIMSKY

APPLIED PHYSIOLOGY By SIMSON WRIGHT, M.D., MRCP. Fourth edition. Octavo of 552 pages, illustrated. New York, Oxford University Press, 1931. Cloth, \$5.50 (Oxford Medical Publications).

This, fourth, edition is very welcome to students and teachers of the subject and especially to practitioners of medicine, for whom the value of previous editions has been proved. The thoroughness of the revision of its text reflects great credit upon its author and the amount of new material incorporated gives evidence of extensive acquaintance with recent literature as well as of sound judgment concerning the real value of experimental findings as such and as applicable in diagnosis and treatment. Despite the considerable amount of carefully selected and well arranged new material there is but slight increase in the bulk of the volume, which remains of handy size though greatly enhanced in value. So far as this reviewer is aware this book has no close competitor.

J. C. CARDWELL

THE TREATMENT OF ASTHMA By A. H. DOUTHWAITE, M.D., FRCP. 12mo of 164 pages. New York, William Wood & Company, 1931. Cloth, \$2.50.

The Treatment of Asthma by A. H. Douthwaite is a short treatise on that disease. He clearly describes the disorder in all stages and with complications. There is a brief statement of the most recent theories and researches.

While containing nothing new or startling it is a practical little book which epitomizes the generally accepted concept of this malady.

DOROTHEA E. CURNOW

AIDS TO PHYSIOLOGY By HENRY DRYERRE, Ph.D., MRCS. 16mo of 255 pages illustrated. New York, William Wood & Company, 1931. Cloth, \$1.50 (Students Aids Series).

The object of the book, according to the author, is to give a concrete, concise survey of the field of Physiology, so that the reader may more profitably utilize the larger standard textbooks. But like so many other compends, a complete survey is not presented such important topics as conditioned reflexes and maintenance of attitude and posture not being commented upon at all. The subject matter is dealt with in an elementary fashion and would therefore be of considerable value to the beginner in the field but not to the medical student.

In the first part of the book, the chemistry and histology of tissue and muscle nerve physiology are presented. The latter part is taken up with circulation

respiration, sympathetic and central nervous system, endocrines, kidney and special senses. The physiology of the gastro intestinal tract, and to a less degree, the nervous system, is discussed in detail.

DAVID I. ABRAMSON

UNITED STATES ARMY X-RAY MANUAL Authorized by the Surgeon General of the Army. Second edition, rewritten and edited by Lt. Col. H. C. PILLSBURY, MC US A. 12mo of 482 pages, illustrated. New York, Paul B. Hoeber, Inc., 1932. Cloth, \$5.00.

The United States Army X-Ray Manual may be referred to as 'the first step to Roentgenology' for such has the previous edition served to many of the present day specialists in this field. Lt. Col. Pillsbury however has made the second edition even more valuable by adding a description of the technique and application of the diagnostic procedures developed since the earlier publication. The volume includes a description of X-ray apparatus technique and interpretation, which while of necessity brief, is most concise and represents probably the most valuable single volume in the X-Ray field.

RICHARD A. RENDICK

THOMSON & MILES' MANUAL OF SURGERY By ALEXANDER MILES, M.D., LL.D., and D. P. D. WILKIE, M.D., FRCS. Eighth edition, volumes 2 and 3. 12mo of 1263 pages illustrated. New York, Oxford University Press (c1931). Cloth, \$3.80 each (Oxford Medical Publications).

The second volume of this excellent manual, containing the teachings of fractures, joint diseases and tumors is in every respect a peer of its kind. The information is complete and modern in every essential detail. The illustrations are instructive, the presentation terse and well planned. Of the 670 pages none should be missed by the reader.

Volume three is devoted to the Surgery of the thorax and abdomen. It is up to date in every respect. This volume along with the two preceding ones should grace the desk of every budding surgeon.

GEO. WEBB

EPIDEMIC ENCEPHALITIS—Etiology—Epidemiology Treatment Second Report by the Matheson Commission, William Darrach, Chairman. 12mo of 155 pages. New York, Columbia Press, 1932. Cloth, \$1.50.

This book is a second report of the work by the Matheson Commission for the study of Epidemic Encephalitis. It contains for the most part a summary and critical review of the literature up to the end of 1929. Regarding the etiology the Commission concluded that the question is still unanswered. A chapter is devoted to types other than epidemic encephalitis. Another chapter is devoted to the treatment of epidemic encephalitis. The Epidemiology is thoroughly discussed. An excellent bibliography enhances the value of this small but valuable book.

IRVING J. SANDS

THE STORY OF MEDICINE By VICTOR ROBINSON, M.D. Octavo of 527 pages. New York, Albert and Charles Boni, (c1931). Cloth, \$5.00.

A history of Medicine as absorbing as a novel. The author actually sculpts, in a fascinating and artistic manner, the process of the development of our present day conception of medicine from the earliest day of mankind. The wealth of detail and numerous personalities described, though necessary for the completeness of the history, are occasionally confusing and tiring to the reader.

Many delightful hours can be had communing with lore and learning, fancy and fact, cult and science contained in this brilliant and vivid volume.

GEO. WEBB

OUR NEIGHBORS

WASHINGTON STATE WHITE HOUSE CONFERENCE

The May number of *Northwest Medicine* contains an editorial on the Washington State Conference on Child Welfare which says:

"The Washington State White House Conference on Child Health and Protection was held at the Olympic Hotel, Seattle, April 1-2, with a registration of 530. Most of the agencies throughout the state interested in various phases of child activities were represented and many of the representatives took part in the program and discussions. The Conference was the result of a movement which had its inception in the summer of 1931, during the visit of Dr. H. E. Barnard, director of the White House Conference. His conference with the state authorities was part of the program of the National Conference to disseminate its findings and recommendations as widely as possible. Preliminary steps had been taken and conferences called in some twenty-five states, usually by their respective governors, but on account of the definite statement by Governor Hartley that he was not interested in such activities, the work in Washington was initiated by Dr. N. D. Showalter, State Superintendent of Public Instruction.

"There are over a hundred organizations and agencies in this state actively interested from various angles in child health and protection, very few of which have any idea of what the others are doing or prepared to do. A wide and active

interest is developing among individuals and lay groups in the work and findings of the White House Conference, with a rapidly increasing demand for information and guidance.

"With the exception of physicians interested in public health, there were very few members of the medical profession present. This is to be regretted and deplored, because many lay organizations which are engaging in or are planning activities directly related to the health of children, will welcome the advice and guidance of the medical profession, and will assume that the advisers are familiar in a general way at least with the bearing which other factors in child life have upon health matters. The medical profession must in many instances offer this aid rather than wait for an invitation, and should be in a position to guide activities rather than to criticize bad results which have developed through ignorance or misinformation.

"For the continuation of the work the state has been divided into eight districts which will be sub-divided according to local conditions. Each district will organize for the study of conditions bearing upon child health, for the study and application of the findings of the White House Conference, and for the collection and analysis of data to be presented to a second conference at a future date, possibly in time for suggestions as to remedial legislation."

PUBLIC SCHOOLS FOR CRIPPLED CHILDREN IN WASHINGTON, D.C.

The May number of *Medical Annals* of the District of Columbia has an editorial describing the special work of the public schools of Washington in giving crippled children not only classroom instruction, but also treatment with an extensive outfit for hydrotherapy, lamps, splints, and other apparatus:

"In November, 1929, two public schools for crippled children were opened in the District of Columbia; Weightman School for white children at 23rd and M Streets, N.W., and Magruder School for colored children at 17th and M Streets, N.W.

"These children are collected from all sections of the city by buses rented by the District of Columbia from a local traction company. At the opening of Weightman School approximately 40

children were admitted, this number now having increased to fifty. The equipment authorized by Congress has been completely installed and except for more needed floor space the building is well provided to care for those now in attendance.

"The dietary demands of each child are given special attention by a dietitian and a cook. At 10 o'clock in the morning the children are given milk, and at noon a well balanced meal is served. A matron is always on duty to care for the many individual wants which may arise.

"One physiotherapist works full time, treating the children who are sent from their class rooms according to a definite program. Each child is treated twice a week and special exercises are given daily in some cases.

The Rationale of FARASTAN as an Anti-Rheumatic Agent

The clinical success of Farastan (Mono-Iodo-Cinchophen Compound) in the management of arthritic, neuritic and rheumatic conditions is based on the unique form in which the iodine is incorporated in the cinchophen molecule. This insures the combined effect of cinchophen and nascent iodine, and explains why Farastan relieves pain, helps to reduce swelling and increase motion, with an unusual freedom from undesirable side reactions.

*Write for literature and full

Philadelphia, Pa.

(Continued from page 826)

"No child is treated without written permission from the parent or guardian and a prescription signed by the physician in charge of the case. The school medical inspector visits frequently, and all activities are closely supervised by him.

"The greatest difficulty has been overcome by the Parent Teacher's Association which has without fail provided transportation to the numerous clinics where it has been necessary to send children whose parents have been unable to take them. This is done, of course, only with the parents' full consent.

"It is generally felt that the school has passed the experimental stage and has now become a permanent institution. At a meeting of a committee representing the Board of Education, the Health Department and the Kiwanis Club, it was decided that the project was quite worthwhile, and plans are now under way to ask Congress for another appropriation to build a larger and even better equipped institution. There is some question as to whether it is more advantageous to continue on the present regime or to build the new school in connection with Children's Hospital and transfer all medical care of the children to the Hospital.

"There can be little doubt in anyone's mind that it is economically necessary to educate these children, and to one who is thrown in daily contact with them it seems ethically a glorious idea. It is enough to say that most of the children dread vacation, which should make the next step the establishment of a summer school for them. Visitors are cordially welcomed and are asked to suggest investigation of the school to those for whom it might help solve a difficult problem."

FINANCES OF FLORIDA ASSOCIATION

The President's address at the annual meeting of the Florida Medical Association on May third, reported in the May Journal of the Association, discusses dues as follows:

"In some sections and in the minds of some individual members there seems to be a feeling that our dues are too high and that there is extravagance in the administration of our affairs. The small sum which we contribute yearly to the Association might well be considered as a premium on a form of insurance, which will to some extent protect us against influences and encroachments which are destructive to ourselves, our ideals, our very existence.

"The joint report of the secretary, treasurer and business manager will show that there has been no extravagance and no mismanagement. Our surplus fund has been safely and wisely invested and while the amount on hand may seem large, our increasingly larger position in public

Tonicine

A reconstructive
gonadal tonic

TONICINE combines an efficient gonadal hormone with the added tonic effects of strychnin and glycerophosphates. Tonicine represents the entire hormonal activity of the sex glands, and is prepared in two forms, for male and female respectively, to avoid the irrational practice of combining ovary and testicle in the same preparation.

Tonicine is of definite value as a general tonic and reconstructive. It is especially indicated in asthenia, anorexia, convalescence from illnesses, hypogonadism, and neurasthenia.

Tonicine Female contains, in each fluid dram, hormones representing fresh ovary 5 grains, strychnin sulphate 1/200 grain, and sodium glycerophosphate 1 grain.

Tonicine Male contains, in each fluid dram, hormones representing fresh testicle 25 grains, strychnin sulphate 1/200 grain, and sodium glycerophosphate 1 grain.

affairs and our campaign of education demands that the fund be increased continuously. In 1927, 1928 and 1929 with a membership of approximately 1,100, we were able to get out of debt and build up a surplus of some \$10,000; but now, with a decrease in membership from removals and death and with comparatively few additions, our expenses in proportion have crawled up. The past year our surplus has increased about \$1,700, due entirely to the activity of our business manager, in decreasing salaries and curtailing expenses, especially in connection with the publication of the Journal. But it will decrease rapidly if the Public Relations and Legislative Committees continue to display the activity they now present.

"If our dues are reduced to \$5.00, as suggested by a few, our present surplus would eventually become exhausted and our Association would become little more than a skeleton organization. The Journal would have to be curtailed, until it might revert to the type and irregularity of the early twenties. The activities of the Public Relations Committee would have to be entirely discontinued and it is more than probable that we would lose the services of our very efficient business manager.

"I believe that if any change is made our dues should be materially increased so that a medical defense fund could be established."

ANNUAL REGISTRATION IN MINNESOTA

The June number of *Minnesota Medicine* contains the following editorial on the annual registration of physicians:

"An analysis of the laws pertaining to the annual registration of physicians in the various states of the Union by Dr. E. J. Engberg, secretary of our State Board of Medical Examiners, appeared in a recent issue of the *Federation Bulletin*. There has been a steady increase in the number of states requiring annual registration of those engaged in the healing art since California led the way in 1917. Now seventeen states require this yearly registration with fees ranging from \$1 to \$10.

"From the questionnaire sent to the secretaries of the various State Boards it was ascertained that the majority of the secretaries favor annual registration. Without it, a Board has a record only of those who have been licensed to practice in the state and data concerning the practitioner for the most part only up to the time he was licensed. With it, the Board knows who are practicing in the state. In addition, the registration

(Continued on page 831—adv. xv)

(Continued from page 830—adv xiv)

fee furnishes a fund which can be used to enforce medical practice laws.

"The practical result of such registration is well known in the case of Minnesota. Previous to the enactment of the present law requiring yearly registration, prosecutions of those practicing in the state without a license were almost unknown, largely because of lack of funds. In the last four years, however, the Board has investigated 213 cases and obtained fifty-four convictions out of fifty-eight cases brought to court.

"Some have objected to the principle of taxing the medical profession for the purpose of enforcing a law designated to protect the public. The same criticism might be made of other fees, which are in effect special taxes. On the other hand the enforcement of medical practice laws does benefit physicians as well as the public. Doubtless many State Medical Associations would be willing to donate a sum yearly, as is done in Kentucky, to help enforce these laws."

PUBLICITY IN FLORIDA

The annual report of the Public Relations Committee of the Florida State Medical Association is contained in the May number of the Journal of the Association. This committee deals entirely with popular medical publicity through the press, the radio, and the moving picture. The radio bureau is described as follows:

"This Bureau has been functioning smoothly. It is composed of two parts. The first is a major program for the entire year. This has been mapped out as coming directly from men interested in and connected with headquarters of the State Medical Association Station WRUF, University of Florida, Gainesville, has cooperated to the fullest extent."

Some of the topics discussed were as follows:

- Medical History of Florida
- The Medical Profession.
- The Hospital.
- Internal Medicine.
- State Board of Health.

The Press Bureau is described as follows:

"The entire press of Florida has been circularized. The Committee collected, or received, thirty-one articles, either original or rewritten, from various members of the Florida Medical Association. Each article is three hundred to four hundred words in length and is ready for press publication.

"Starting with December 16, 1931, and carried through to February 9, 1932, articles were released one each week. These articles were released at a time when their topic was thought to be the most useful to the Florida reading public.

10 YEARS

Our first
announcement
met of
S.M.A.

of PREVENTIVE INFANT FEEDING

In November, 1921, the S.M.A. Corporation announced an epochal development in The Journal of the American Medical Association.

This development was called S.M.A. and resembled breast milk so closely that about 95% of infants deprived of breast milk would do well on it. It was a departure particularly in its preparation of the fats, and it also was a departure because it included enough cod liver oil to be antirachitic.

In offering S.M.A. to the medical profession, S.M.A. Corporation was the first company to recognize the importance of the antirachitic factor by including it in the fat, giving automatic protection. S.M.A. is still the only antirachitic breast milk adaptation.

The excellent results produced by intelligent feeding of S.M.A. created such a demand that its use is general all over the United States and in many foreign countries.

More than 3 hundred million feedings of S.M.A. have been prescribed by physicians.

What Is S.M.A.?

S.M.A. is a food for infants—derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil with the addition of milk sugar, potassium chloride

and salts, altogether forming an antirachitic food. When diluted according to directions it is essentially similar to human milk in percentages of protein, fat, carbohydrates and ash, in chemical constants of the fat and in physical properties.

**COMMITTEE
ON PUBLICATION . .**

(Continued from page 831—adv. xv)

"There were approximately one hundred seventy copies sent each week to the Florida newspapers; of these not over fourteen were during any one week. Your state officers, State Executive Committee, and the Public Relations Committee came in for some rather rough usage from several small-town newspaper editors, their idea seeming to be that the medical profession was endeavoring to obtain 'something nothing,' namely, free advertising. The State Executive Committee felt that because of the considerable labor necessary for these publications, the necessary expense, the poor response, and adverse criticisms, that this phase of our program should be in some way rearranged.

"Your Committee has been instrumental in advising several county societies against making outlay of money for a set of copyrighted art to appear in the local press. It was explained the State Association is attempting, through Committee, to spread similar propaganda, of more educational value, and through more diversified channels including the press, thereby bringing a saving to the county society and individual members."

The Motion Picture Bureau is described as follows:

"This Bureau has ascertained sources of medical and medical educational motion pictures and has on file at present five available sources with a total of thirty-eight films; eighteen which are on the rental plan, and twenty which are on the free plan. Of these twenty free films, three have the transportation paid one way only, and seventeen have the transportation paid both ways, with the use of a projector and an operator without cost requested."

INHERITANCE OF MEDICAL SKILL IN MASSACHUSETTS

The NEW YORK STATE JOURNAL OF MEDICINE has recorded the known instances of the practice of medicine by father, son, and grand-son and has been able to obtain only a few records. The *New England Journal of Medicine*, November 19, 1931, contains the following brief note on eight generations of doctors in one family:

"In recognition of several generations of doctors the town of North Andover recently dedicated a drinking fountain to perpetuate a record of service to humanity by a remarkable line of physicians beginning with John Kittredge in 1630, who was followed by eight generations, all bearing the family name, an aggregate service covering about thirteen centuries.

"The North Andover fountain was given by John Kittredge and his wife, Frances B. Kittredge of Taunton."

*Fills the need for a dependable
antacid mineral water*

VICHY CÉLESTINS

This long renowned naturally alkaline mineral water assists in neutralizing excess acid and in regularizing functions of the digestive tract.

Bottled at the Spring in Vichy, France, under Government supervision, it meets the great need of the physician for constancy of composition.

IOWA STATE MEDICAL LIBRARY

The April number of the Journal of the Iowa State Medical Society contains the following editorial on the Iowa State Medical Library:

"This Medical Library, now composed of 15,200 volumes, is a part of the Iowa State Library housed in the Historical Building in Des Moines, and is efficiently operated by a graduate physician thoroughly familiar with medical literature. Augmenting the facilities offered by the bound volumes, the library has thousands of pamphlets and magazines. Limited funds are available for the purchase of new volumes, which, because of their judicious handling, have proved sufficient to keep the library files up to date and well stocked with current journals. Complete sets of the Index Medicus, the Cumulative Index of the American Medical Association, and the Surgeon-General's Index, are available. The librarian will attempt to cooperate with any physician in the state in securing information upon a particular subject in which he is interested. Where books are desired that are unavailable in this library, the librarian will secure from other sources the desired volume and transmit it to you. From the generous number of ab-

stracts on hand, the librarian can furnish frequently the translation or abstract of foreign articles. Physicians wishing to read current medical journals to which they are not subscribers may secure these current journals from the State Medical Library.

"Some physicians have been deterred from using the library in a generous fashion due to the fact that they anticipated that such an elaborate service would necessarily be an expensive one. The surprise of this excellent service is the cost. The physician may obtain any volume he wishes from the library upon payment only of the transportation costs involved. He may receive the journals, abstracts or bibliographies referred to at no cost other than the actual postage required.

"The librarian wishes to serve just as many physicians as possible, and to those who have availed themselves of this opportunity the service needs no recommendation. To those who are unfamiliar with the service, we would urge that you become acquainted with the librarian and the library.

CHARGES AGAINST DOCTORS IN COLORADO

The Colorado State Board of Medical Examiners takes notice of charges of unprofessional conduct brought against practicing physicians, and thereby performs some of the duties of the Grievance Committee of the State of New York. The May issue of *Colorado Medicine* tells of the action of the Mayor of a small city and a delegation of twenty-one citizens who came to Denver to protest against the action of the State Board of Medical Examiners in considering charges against two doctors of the city, although the doctors had already been exonerated by the Board.

Dr. W. W. Williams, Secretary of the Board, made the following statement in the *Journal*:

"This is an outrage," Mayor Nichols told Attorney General Ireland. 'Haines, the investigator, is going about the state snooping into the private lives of reputable physicians and then bringing charges against them. The mere fact that charges are filed does serious damage to the reputation of the doctors.'

"Haines' activities, according to state officials, are financed from a fund which was created through assessing Colorado physicians and chiropractors \$3 each.

"Mayor Nichols told Attorney General Ireland that members of the medical profession throughout the state are up in arms against the state board for having Haines conduct secret investigations of their activities.

"Attorney General Ireland declared he would make a personal investigation of the activities of the medical board.

"The medical board, at its session Wednesday, restored the license of Dr. H. H. Thomas of Denver.

"It always has been, and still is, the policy of the Colorado State Board of Medical Examiners to give out no information concerning the physician involved and the charges against him unless the charges warrant the revocation of his license to practice in Colorado.

"When such information is given out, this action is compelled by statute, which requires the Board to notify the clerk and recorder of each county in the state in which the license is recorded to remove the holder's name from his records.

"If the names of the doctors who came up for

(Continued on page 835—adv. xix)

(Continued from page 834—adv. rxm)

a hearing before the Board at its last meeting on April 5 and 6, and the charges preferred against them, had not been divulged by some of their own witnesses or by themselves, such information would never have been given out by the Board

"A vital purpose of the Board is not only to protect the public against negligent and ignorant malpractice on the part of licensees but equally to defend doctors against unwarranted charges brought against them.

"When charges are filed against any licensee, no matter how trivial or unreasonable it is the duty of the Board to investigate them fully. Most of this investigative work is carried on by the deputy secretary-treasurer, Mr. Charles H. Haines, under the direction of the Board. Naturally, the interviewing of persons who might possess knowledge relative to the charges must take place. The insinuation that Mr. Haines goes about the state 'snooping' into the private lives of reputable physicians, then to bring charges against them, is ridiculous and without any foundation of fact. Very few reputable physicians have charges filed against them, but in such cases it is just as much the duty of the Board to investigate as if the charges were against one of doubtful reputation. Occasionally reputable physicians are saved much annoyance and undeserved publicity by the Board finding the charges are unfounded and thus heading off malpractice suits."

LIAISON COMMITTEE IN TENNESSEE

The following editorial in the May issue of the Journal of the Tennessee State Medical Association, explains some of the work of the Liaison Committee.

"The medical profession of Tennessee has taken a long forward step in the interest of public health and the profession of medicine.

"Last year, by amendment to the by-laws there was created a committee known as the Liaison Committee, whose duty it is to give serious thought to the policies and activities of various health agencies in the state as they affect the public and the medical profession.

"After considering all phases of the question, this committee made definite recommendations to the House of Delegates this year which were adopted. The recommendations were in brief as follows:

"1. The passage of an amendment to the so-called reorganization bill which provides that a public health council of seven members shall be formed.

"The Governor will appoint the members of this council from a list of nominations by the House of Delegates of the State medical association.

(Continued on page 836—adv. rx)

The "Pomeroy" Supporting Corset

A good corset, properly made and fitted, not only gives needed support to the vital organs, but moulds the figure to correct and graceful lines.

The Pomeroy is ideal for this purpose, for it is so designed that the uplift is given by the corset itself with no need for additional belt or other contrivances. The intersecting laces give an extra upward and backward lift which further helps the muscles of the abdomen to give the necessary support.

tion and one member nominated by the state dental association.

"That this public health council will elect the executive officer, or commissioner of health, and formulate the policies of the department.

"The next recommendation is the members of the Tennessee State Medical Association must carry the responsibility of doing the actual work of immunizing people against contagious or infectious disease where such procedures are of proven value. To this end an educational committee is to be formed for the purpose of supplying each and every doctor with accurate information as to the actual technique in the use of various agencies.

"It is believed that, by these steps, the public will enjoy a greater protection against communicable disease, and that the greatest possible harmony between the health agencies of the state and the medical profession will be promoted."

PUBLIC RELATIONS COMMITTEE IN PENNSYLVANIA

The Public Relations Committee of the Medical Society of the State of Pennsylvania has a somewhat different field from that of the New York State Society as is shown in the following news note from the January

number of the *Pennsylvania Medical Journal*:

"The Committee of nine active and five ex officio members was subdivided into three subcommittees in order to expedite the year's work:

"(1) A committee to prepare for distribution through appropriate channels historical facts and other data regarding medical contributions to human happiness; Drs. Mechling, Mayer and Donaldson; (2) A committee to emphasize the need for active participation by representatives of the organized medical profession in all counties, in the administration of all public movements touching upon health and sickness prevention—Drs. Krusen, Cross and Harley; (3) A committee to emphasize the part to be played by the medical profession in the economic adjustment of medical service to those who are ill—Drs. Foss, Smith, Gannon and Bishop.

"Dr. Wilmer Krusen was appointed to confer with Secretary of Public Instruction James N. Rule regarding the introduction of prescribed standard courses in the high school curricula in Pennsylvania in the teaching of health and its allied subjects.

"Under general discussion it was decided to emphasize to county societies the advisability of developing a library, also reviving interest in periodic health examinations."

GRADUATE EDUCATION IN VIRGINIA

The Medical Society of Virginia is extending its work in graduate education, and has secured the services of the faculties of the medical schools of the State, as is told in the following announcement in the May issue of the *Virginia Medical Monthly*:

"In response to the request of the officers and chairmen of program committees of many medical societies, members of the faculties of the Medical College of Virginia and the University of Virginia, sixty-one in number, have volunteered their services as clinicians and instructors for educational meetings. Each speaker is available for engagements which involve reasonable travel. Invitations for them to appear on programs should be made as far in advance as possible, either directly or through the officers of the Department, Dr. J. C. Flippin, Chairman, and Mr. George W. Eutsler, Executive Secretary, at the University of Virginia."

The Journal gives a list of the lecturers and the 136 subjects which they offer. It also has the following description of a clinical day in Norfolk:

"The All-Day Post-Graduate Clinic by the Norfolk County Medical Society on March 30th, was a great success. This was participated in by about thirty members of the local society and was attended by about sixty physicians from out of town in addition to a large number of local doctors. One hundred and eight of these attended the luncheon at Norfolk Protestant Hospital, following the morning clinics there. The afternoon clinics were held at St. Vincent's Hospital and these were followed by supper at the Norfolk Country Club at 6 o'clock. There were one hundred and thirty-six present for this occasion. At 8:00 P.M., Dr. D. L. Borden, professor of surgery at George Washington University School of Medicine, Washington, D. C., gave a talk on 'Some Unusual Intro-Abdominal Lesions,'

which was illustrated by moving pictures. This meeting had an excellent attendance.

"The papers, illustrations and other demonstrations were very instructive and those present seemed to feel that the Clinic was a great success and well repaid them for their efforts in attending. The committee arranging the clinics was composed of Dr. Julian L. Rawls, chairman, and Drs. A. Brownley Hodges and Robert DuVal Jones, Jr."

GROUP CONFERENCES AT THE MAINE ANNUAL MEETING

The March issue of the *Maine Medical Journal* contains the following announcement regarding the plans for group conferences at the Annual Meeting to be held June 16-18, 1932:

"The two morning sessions on Thursday and Friday will be devoted to a series of Group Conferences, covering a variety of subjects. The two afternoon sessions and the closing session Saturday morning will be devoted to scientific papers.

"The Group Conferences will be a very important part of the meeting. These Conferences will be limited to fifteen men each, and they will be given in four series, about twelve running simultaneously. A list of the Conferences, with the leader of each, is given below. Members are requested to apply for the Conferences they desire to attend. Each group will be given Thursday at 9:00 A.M.; the second group on Thursday at 10:30 A.M.; the third group Friday at 10:30 A.M., and the last group Friday at 10:30 A.M. In order that the committee may so arrange these Conferences to accommodate the wishes of the greatest number, members of the Association are requested to fill out the coupon attached below."

The announcement lists forty-five conferences on a great variety of scientific subjects of medical interest.

CLASSIFIED ADVERTISEMENTS

Classified ads are payable in advance. To avoid delay in publishing, remit with order. Price for 40 words or less, 1 insertion, \$1.50; three cents each for additional words.

WANTED: Salaried Appointments everywhere for Class A physicians. Let us put you in touch with investigated candidates for your opening. No charge to employers. Established 1896. Aznoe Service is National, Superior. Aznoe's National Physicians' Exchange, 30 North Michigan, Chicago.

SANITARIUMS—FOR SALE

We have a number fully equipped, some partially so, and properties that can be made suitable; New York, New Jersey, Connecticut. Send for list and give number of rooms wanted for patients (approximately), also location desired. Address Swift Realty Co., 196 Market Street, Newark, N. J.

ARLINGTON, New Jersey, 211 Stewart Av. —Attractive 7-room house; plot 120x103; oil burner; 2-car garage; 8 miles from New York City; 5 minutes' walk from station and bus lines; rent \$100 month or sell, easy terms, at a bargain price. Owner, Box 5, Care N. Y. State Journal of Medicine.

FOR SALE—Established and unopposed practice in plastic surgery and fully equipped office in western New York. Address Box 25, care N. Y. State Journal of Medicine.

OLD APPARATUS TRADED-IN
DON'T HANDICAP YOURSELF BY USING OBSOLETE bloodpressure apparatus; you can now trade-in your old instrument for the most modern, up-to-date 1932 equipment, and receive a liberal allowance on your apparatus; write, giving name of instrument now used, approximate year of purchase, and we will forward you our latest catalog of modern bloodpressure apparatus, together with an out-

line of our liberal trade-in policy, telling exactly how much we will allow you on your old equipment. Charles C. Edinger, 490 Atlantic Ave., Brooklyn, N. Y.

FINE OPENING FOR PHYSICIAN AND SURGEON

Dr. — has enjoyed an unusual practice for 25 years. Has beautiful modern home with office combined. Centrally located. Completely furnished. He is retiring. Some practitioner wants to step right into this fine opening. Will sell at right price, or lease to satisfactory client. Write. Walter B. Tower, Penn Yan, N. Y. Phone 552.

POST-GRADUATE HOSPITAL

A total of 59,789 patients was given treatment during 1931 in the Out-Patient clinics of the Post-Graduate Hospital and its traumatic unit, the Reconstruction Hospital, while 11,363 patients were cared for in the hospital proper, according to the forty-ninth annual report of the New York Post-Graduate Medical School and Hospital published last week.

Of the 103,685 days of hospital care at Post-Graduate alone, 19,634 days' care were given free, and the cost of treatment not covered by payments is estimated at \$225,717.03 for the year.

"Hospital admissions give an accurate picture of the economic situation," stated Dr. Edward H. Hume, Executive Vice-President of the combined institutions. "Patients stayed fewer days on the average and elected less costly accommodations than for a

long time past. Many more availed themselves of the service of the public wards. The Out-Patient Department set up a new record of attendance—the largest in its history—visits to both Post-Graduate and Reconstruction Hospital clinics totaling 306,484, an increase of 14,433 visits over those of 1930." An average of 950 persons attended the clinics daily for treatment with attendance running up well over a thousand on many clinic days.

There was a enormous increase in the case load of the Social Service Department, according to the Director, who reports 6,104 new patients applying for aid during 1931, as compared with only 3,192 the previous year. Of the 8,548 patients coming under the supervision of Social Service, 6,390 were given treatments in the Out-Patient clinics and 2,158 cared for in the hospital wards. Close cooperation has been maintained throughout the year with the Emergency Work Bureau, the hospital giving medical aid to those referred by the Bureau and the latter finding employment for some of the Hospital's most deserving patients. —See page xxii.—*Adv.*

CREST VIEW SANATORIUM

Charmingly located, beautifully appointed; in the hilly country one and a half miles from Long Island Sound where the air is tonic. Truly homelike, no institutional appearance. See page xxiii.—*Adv.*

COLUMBIA UNIVERSITY NEW YORK POST-GRADUATE MEDICAL SCHOOL

offers an eight months' course in

OTO-LARYNGOLOGY

beginning October 3, 1932

Included in the course are: Anatomy and physiology of the nose, throat and ear; embryology, histology, pathology, and bacteriology of the nose, throat and ear (given by laboratory staff); dissection of the head and neck; and nose, throat, and ear operations (cadaver); daily clinics in a large out-patient department; bronchoscopy; etc. During the last few months the matriculate performs under supervision a number of the more common nose and throat operations in the out-patient department. Laryngology under the direction of Dr. Duncan Macpherson. Otology under the direction of Dr. Warren C. McFarland. For further information, address

ANEMIA IN THE NEW BORN

By GILBERT DALLDORF, M D, and HOLLIS K RUSSELL, M D, VALHALLA, N. Y.

The purpose of this paper is to report a case of severe primary anemia in the new born, and to discuss its relationship to the nutritional anemias of infancy

CASE REPORT

History—B B, a white male infant born June 4, 1931, was jaundiced and very pallid. The father, 33, and the mother 30 years old, had always enjoyed good health. The parents had been married twelve years and the mother had been pregnant four times. The previous pregnancies resulted in two abortions and one miscarriage. The first abortion occurred during the sixth week of gestation (December, 1920) and the second occurred two years later during the twelfth week of gestation. The miscarriage occurred in the fourth month of gestation in August, 1926.

The product of the fourth pregnancy is the subject of this case report. At the fourth month of gestation the mother had erysipelas from which she recovered promptly. Her blood pressure was normal throughout her pregnancy. During the latter months a trace of albuminuria was present. No drugs were taken during pregnancy. The blood Wassermann was negative. Labor began spontaneously at full term and was of short duration. The cord Wassermann was negative.

The infant at birth weighed six pounds eight ounces, was well developed and cried spontaneously. It was noted that the infant was jaundiced. The color of the skin was not the reddish-yellow of icterus neonatorum but an extremely pale yellow. The temperature was normal and remained so throughout the period of observation. The stools were normal. An examination on the second day of life revealed a few purpuric spots on the chest. The lungs and heart were normal. The liver and spleen were found to be enlarged and readily palpable below the costal border. The jaundice gradually lessened until its disappearance about the twentieth day, and as the jaundice cleared the pallor became more evident.

On the sixth day of the infant's life an examination of the blood was made and the following results obtained:

Erythrocytes	1,250,000
Leucocytes	19,100
Hæmoglobin	30% (Salhi)
Color Index	1.2

The differentiation of the leucocytes

Lymphocytes	4%
Basophils	1%
Myelocytes	4%
Metamyelocytes	6½%
Band forms	14½%
Mature forms	15%
Lymphocytes	41½%
Monocytes	13½%

Study of the erythrocytes showed numerous nucleated forms, mostly normoblasts. Slight poikilocytosis and anisocytosis as well as punctate basophilia and polychromasia were also noted.

The infant was given twenty cubic centimeters of the mother's blood intramuscularly on the sixth day of life and on the ninth day of life was transfused with seventy cubic centimeters of the father's blood. An examination of the blood on the twelfth day showed:

Erythrocytes	1,130,000
Leucocytes	23,800
Hæmoglobin	35% (Newcomer)

The color index was therefore 1.5

A differential count revealed no significant change in the relative percentages of the various cell types and the morphology of the erythrocytes had not changed. Examination of the stools, urine, fragility test and coagulation time yielded normal results. Icteric index was thirty eight and the Van den Bergh reaction showed a delayed direct, indirect reading. A blood culture reported on the sixteenth day after two weeks' incubation was negative.

Re-examination of the blood on the twenty-sixth day of life showed:

Erythrocytes	1,640,000
Leucocytes	11,000
Hæmoglobin	38% (Newcomer)
Color index	1.2

The child was discharged from the hospital July 10, 1931, having gained twenty-one ounces in weight.

On the fifty-fifth day of life the mother and infant visited the hematological clinic. An examination of the blood showed the erythrocytes to be 2,580,000 per cubic millimeter and the hæmoglobin 50% (Newcomer). At this time the leucocyte count was 9,750.

Eosinophiles	4%
Eosinophilic myelocytes	1%
Eosinophilic metamyelocytes	1%
Neutrophilic metamyelocytes	6%
Band forms	7%
Mature forms	10%
Lymphocytes	55%
Monocytes	16%

In addition fragility test, coagulation time, bleeding time and capillary resistance tests¹, taken at this time, all yielded normal results.

When three months of age the infant's blood was again examined and the erythrocytes found to be 4,530,000 per cubic millimeter, hæmoglobin 70% (Newcomer) and the leucocytes 12,450.

During the course of improvement of the blood picture an equally marked and corresponding improvement was noted in the appearance and clinical condition of the infant. There was a gradual increase in weight until at the end of three months the infant weighed twelve pounds. In addition the color approached normal and he appeared to be well nourished and healthy.

SIGNIFICANCES OF BLOOD FINDINGS

The severity of the anemia in this case is greater than the figures first suggest, since the standard for infants and children is definitely higher than for adults. The blood of the new born shows higher erythrocyte values, 5,000,000—8,000,000, and very high hæmoglobin values, 100-120%. Soon after birth these high values fall slowly until at nine months the hæmoglobin averages 75%. The relatively high leucocyte counts of the first two examinations are well within the normal limits for new born, 15,000-30,000, usually dropping on the fourth to sixth day to 7,000-10,000 and then gradually rising². Likewise the large number of immature myelocytic cells present may be regarded as normal, for Schilling states that

the blood at birth shows a great many immature neutrophils including myelocytes and metamyelocytes. Arneth³ reported as normal for new born the following differential curve which shows a marked shift to the left:

Class	I	II	III	IV	V
	60%	26%	12%	1%	1%

CHARACTERISTICS OF PRIMARY CONGENITAL ANEMIA

The reported cases of primary anemia in the new born have recently been summarized by Pasachoff and Wilson.⁴ Most of the cases are similar to the case just reported.

The average birth weight of the previously reported cases has been six pounds fourteen ounces. The average duration of the disease has been slightly less than six months. The outcome has been fatal in three of twenty-nine reported cases. It is interesting to note that post mortem examinations in the three cases which resulted fatally failed in each instance to determine the cause of the severe anemia.

The degree of the anemia in fifteen cases in which these figures are available may be summarized as follows:

Erythrocytes

- Less than one million, four cases
- One to two million, five cases
- Two to three million, four cases
- Three million and over, two cases

Hæmoglobin

- Less than ten per cent, one case
- Ten to twenty per cent, two cases
- Twenty to thirty per cent, two cases
- Thirty to forty per cent, three cases
- Forty to fifty per cent, seven cases

Leucocytes

- 10—20,000, nine cases
- 20—30,000, three cases
- 30—40,000, one case
- 60—70,000, one case

Color index above one, eight cases.

The spleen was palpable in nine cases. In those cases in which bleeding time, coagulation time and fragility test were performed they have yielded normal results.

In none of these cases, as in the case here reported, was there known cause for the anemia. Indeed there are but few conditions which cause severe anemia in the new born, the most prominent being hemorrhage, active congenital syphilis, hemolytic icterus, prematurity and the so-called hemorrhagic disease of the new born.

Little is known of the etiology of congenital anemia, in part due to the rarity of its occurrence. The only factors suggested have been infections, chronic nephritis and repeated pregnancies at short intervals*. In the present case erysipelas occurred during the fourth month. Nevertheless there is no record of infectious disease in the cases of Bonar⁷, Greenthal⁸, Sanford⁹, Susstrunk⁸, McClelland⁹, Ecklin¹⁰, Canino¹¹ and Pasachoff and Wilson¹. In a number of other cases no mention is made of the mother's health during gestation. It would seem that the incidence of maternal infection has not been unduly high and the etiological importance of infection appears to us to be slight.

DISCUSSION

More is known about the anemias of infants than of the new born. We can do no better than compare the two diseases in the hope that through such comparison some light will be cast upon the origin of the congenital cases. We omit from consideration the anemias of which the primary cause is hemolytic icterus, helminthiasis, leukemia, syphilis or infectious disease of other kind.

In all respects excepting the age of the patients the two groups of anemias are strangely similar. Included in both groups are cases of mild nature and chlorotic type in which hemoglobinemia alone is marked, and severe cases in which erythrocytemia and hyperleucocytosis are also present. The severe cases generally show splenic tumor. Both groups are characterized clinically by pallor, subicterus, flattened weight curves and indifferent appetites. In the cases among infants a latent scurvy or rachitis sometimes is present. Von Jasch's anemia can be considered a severe form of anemia in infants which is eligible to this group.

On inquiry into the cases of infants' anemias we find no evidence to support an infectious origin. Formerly the theory of disturbed iron metabolism or iron starvation was popular. The growing realization that iron feeding had little or no effect in such cases and that at least one group of these anemias (goat's milk anemia) occurred when the iron intake was ample, led to the abandonment of the hypothesis. The present conception is that a deficiency exists but not of iron.

The basis for the nutritional theory of the anemias of infants rests upon numerous observations and much experimental evidence which can be briefly summarized as follows:

(A) The anemias of infancy do not occur in well fed infants.

(B) Cases have been numerous in localities and under conditions where only nutrition might be responsible. In Switzerland many cases of severe anemia have been seen in infants fed on goat's milk. Moreover while the cases have been common in Berne, where the goats are kept in small stalls, they were unknown where the goats were allowed to graze freely on the alpine meadows¹².

(C) Recovery can be expected when the diet is corrected though it must be admitted that recovery is generally more gradual than in the known vitamin deficiencies.

(D) Anemias can be experimentally produced in laboratory animals by dietary means alone. Hart, Steenbock et al.¹³ produced anemias in young guinea pigs on a milk diet.

There has been no evidence to associate these anemias with any of the established vitamins or accessory food factors despite the fact that in many of the deficiencies anemia occurs simultaneously and in experimental scurvy is usually present¹⁴. The improvement of cases fed foods rich in vitamins appears to be due to other factors, since, while Hart and Steenbock were able to cure their experimental anemias with fresh vegetables, chlorophyll, free of Fe and containing no vitamin A, B, C, or D, likewise caused recovery. Moreover, in many cases, there is no evidence of deficiency disease of known nature. Further, goat's milk anemia has been cured by diets at least very low in vitamins¹⁵.

It would appear that an as yet unknown factor is responsible. Gyorgy suggests it is part of the globin fraction of hemoglobin¹⁶.

The case for a deficiency causing the anemias of infants appears substantial if not conclusive. We may now compare the similar or identical anemia of new born and consider whether the similarity may extend to etiological factors as well. Since the latter cases are present before feeding is commenced it would perhaps seem unwarranted to attempt a comparison.

In referring to the experimental study of nutritional disease, however, we find that gestation and lactation are well recognized as critical periods in which not only the mother's health but the health and life of the fetus as well require fully ample diets. As examples may be mentioned the experiments of Walkhoff¹⁷ who produced stigmata in new born guinea pigs by causing partial deficiencies of antiscorbutic substances in the mother's diet, Parkes and Drummond's¹⁸ observation that in deficiencies of vitamin B1 the young died, and Sure and Schilling's¹⁹ discovery that three times the normal intake of B1 was not pro-

1 1931
milk and
Parsons
suggests moreover that cases such as ours are probably nutri-
tional in nature

tective during lactation. Indeed deficient offspring may be expected in most of the deficiency diseases if the supply of the accessory factor is large enough to prevent abortion or prematurity (own observation).

It is worthy of note in this respect that in the nine reported cases in which detailed family histories are given there are four instances of abortion, miscarriage or stillbirth. Including the present case half of the mothers have had one or more incompleting pregnancies. The remaining cases followed close upon previous pregnancies and inspired the opinion that repeated pregnancies predisposed to the anemia. The case histories may be considered in accord with the behavior of experimental animals suffering from any of the known deficiencies.

It may be asked why in such cases a like effect (i.e. anemia) is not present in the mother. This probably follows the difference between the young and the old organism, a

difference particularly marked in the hematopoietic system. Indeed György has suggested that the anemias of infants and Addisonian anemia may have their origin in a common deficiency but that the dissimilarity of the diseases produced is due to the difference in the age groups affected.

In the fourteen cases in which treatment has been described half have been given transfusions and three iron by mouth. In eight cases breast milk was given but in no cases was it the sole diet for more than a brief period. Our own case was given breast feedings for seventeen days but from the second day on supplementary feedings were prescribed by the physicians in charge. The formula used contained eight ounces of evaporated milk, one ounce of Karo syrup and fifteen minims of lactic acid with one half ounce of Casec. The amounts were increased at the end of the first month. Orange juice and viosterol were added on the eighty-fifth day. Iron ammonium citrate was given (10 grains per day) from the thirtieth day onward.

In the accompanying chart may be seen the improvement in hemoglobin and erythrocyte values. A marked improvement followed closely upon the inauguration of the iron therapy but an even greater gain was registered later when orange juice and viosterol were added to the dietary. The beneficial effects of transfusions and iron are common to both the congenital and infantile anemias and, it may be pointed out, to the secondary anemias of adults as well. The action is a stimulatory one and does not damage the validity of the nutritional theory.

CONCLUSIONS

A case of severe anemia in a new born is described and the suggestion made that these cases are the result of nutritional deficiencies.

THE ROENTGENOLOGIC MANIFESTATIONS AND DIFFERENTIAL DIAGNOSIS OF CARCINOMA OF THE COLON*

By B R KIRKLIN, M D, and HARRY M WEBER, M D, ROCHESTER, MINNESOTA

IT IS not an exaggeration to say that the roentgen ray has contributed as much to the precise and accurate diagnosis of carcinoma of the colon as it has to the diagnosis of carcinoma of the stomach. The roentgenologic signs of carcinoma of the colon, like those of carcinoma of the stomach, are distinctive and can be elicited not only at the stage when the disease is clinically apparent on account of the ulceration or obstruction which it has produced but when subjective and objective evidence from other sources is entirely lacking or very indefinite.

In no division of gastro enterologic roentgenology does the roentgen ray compete with the microscope in making histologic diagnoses. The roentgenologist, however, does not hesitate to exercise his prerogative as a physician to reinforce the visual characteristics of a lesion furnished by his special method of observation with such other features as topical manipulation of the diseased segment might supply. Such are the units of which the roentgenologist's conception of the gross appearance of a lesion is composed. His diagnostic efficiency depends in a large measure on his familiarity with macroscopic pathology, and on the facility with which he is able to correlate the gross pathologic picture with the roentgenologic picture. It is not an idle boast to affirm that the roentgen ray can be made to exhibit a favorable showing in competition with macroscopic examination in the diagnosis of carcinoma of the colon and in distinguishing it from other lesions of the colon.

PATHOLOGY

Carcinoma is by far the most commonly encountered malignant lesion of the colon. Sarcoma is seen with extreme rarity. The gross features of a nonepithelial malignant lesion usually bespeak its malignant nature, but a certain diagnosis is possible only after microscopic examination of the tissue.

Rankin classifies carcinomas of the colon morphologically into the following types:

Scirrhous or fibrocarcinoma—In these tumors there are relatively few carcinoma cells. Fibrous tissue, however, may be so abundant that it is difficult to recognize epithelial cells. Early in its development the tumor consists merely of a small, flat, indurated area in the wall of the bowel. Gradually the intestinal tube is encircled in annular fashion. Stenosis develops with cicatricial contraction of the fibrous tissue. The names "annular" or "napkin ring" carcinoma are descrip-

tive of its macroscopic appearance. Ulceration is not a prominent feature, hence early in the clinical course blood or mucus is not noted in the stool, and the disease becomes clinically apparent only when obstruction begins to be manifest. As a rule the tumor itself is too small to be palpable through the abdominal wall. The mass sometimes discovered in association with it is usually a collection of scybalous fecal material proximal to the constriction.

Medullary or polypoid carcinoma—It is important to keep in mind that polypoid tumors, which macroscopically have all the characteristics which we have learned to associate with benign lesions, are not infrequently found on microscopic examination to be malignant. In fact, it is now quite generally believed that medullary or polypoid carcinomas have their beginnings in lesions indistinguishable grossly from the simple and so-called benign polyp. It is therefore to be expected that all stages in the development of a pedunculated or broad based polypoid tumor to the frank medullary carcinoma with extensive exposed surfaces will be encountered. Medullary carcinomas are characterized grossly by large, soft, lobulated or cauliflower-like masses projecting into the lumen from the mucosal surface. The margins are irregular, overhanging, elevated, the floor of ulcerated areas is ragged and covered with exudate. Sometimes the intestinal wall does not seem to have been extensively invaded. More commonly, however, mural infiltration is marked and the lesion has the indurated consistence characteristic of malignancy. Necrosis and sloughing of the peripheral proliferative portions of an originally pedunculated polyp result in a flat saucer shaped lesion.

Gelatinous (mucoid) carcinoma—Morphologically, this type of carcinoma of the colon might be looked on as holding a middle ground between the medullary and scirrhous forms. It becomes a circular lesion, enveloping the bowel in annular fashion, but is a much more extensive lesion than the true fibrocarcinoma. In the latter the constricting feature is apparent from both the luminal and serosal aspects. In the former, however, the wall is markedly thickened, heaping up of the malignant tissue having progressed both into and away from the lumen. The luminal aspect of fibrocarcinoma presents a short stricture with little if any ulceration. With the colloid type of lesion, however, the channel through the tumor is relatively long, and its luminal surface is denuded and irregular in its course. The tumor is firm and when in a situation accessible to manipulation, may be discovered clinically by the hard mass it presents.

* Delivered before The New York Academy of Medicine, February 4, 1932 and published simultaneously in the Bulletin of the Academy.

METHODS OF INVESTIGATION

The opaque meal.—The earliest examinations of the large intestine were carried on with the opaque meal. It is now generally agreed, however, that this method is incapable of delivering adequate information regarding organic lesions, although it still has applications in special instances. Its property of becoming dispersed in scattered masses or accumulated in large lumps in separate segments, prevents a satisfactory estimate of the entire colon. Repeated roentgenoscopic examinations are always required. Further, in the presence of an obstructing lesion, the opaque meal is liable to become impacted above the stenosis. It may thus be responsible for much distress to the patient, and seriously affect the prognosis by becoming the immediate cause of acute intestinal obstruction.

The opaque enema.—Almost all organic diseases of the colon produce deformity in the contours of the lumen of the affected segment. This is particularly true of carcinoma. It follows that the choice of an investigative procedure will devolve on the method which serves best to demonstrate the deformity. The opaque enema is the procedure of maximal efficiency for this purpose.

It is hardly possible to outline the technic of administering the opaque enema without placing emphasis on the necessity of clearing the colon of fecal remnants, gas and fluid before investigation is attempted. This cannot be accomplished without purgation and cleansing enemas. Saline cathartics are ill-advised as purgative agents because they produce their effect by osmotically drawing fluid into the intestinal lumen to the point of maximal distensibility. Evacuation after saline purgation is frequently incomplete and considerable time is usually required for the colon to assume a state of collapse sufficient for satisfactory observation of the opaque enema. On the other hand, purgatives the action of which depends on their property of activating the bowel by severe irritation are likewise undesirable because they are not uniformly efficient, and because of their tendency to leave the colon in such a prolonged state of irritability that retention of the enema becomes extremely difficult or impossible. Castor oil, of all the purgative agents active enough to produce adequate evacuation, is in fact a milder irritant than many others, and we consider it to be the most uniformly efficient purgative agent available for our purposes. The patient to be examined abstains from his evening meal and takes 2 ounces (60 c.c.) of castor oil. The following morning, before the examination, the distal portion of the colon is cleansed with a few normal saline enemas. It is assumed that the castor oil will have achieved this result in the proximal segments. This procedure usually effects a satisfactory preparation, and the routine is broken only for patients with very severe diar-

rhea, for those who have a tendency toward severe intestinal hemorrhages, and occasionally for patients with acute or subacute obstruction.

Occasionally a patient experiences undue difficulty in retaining the enema, and sometimes when there is reason to believe that considerable intestinal spasm accompanies the suspected lesion, the administration of an antispasmodic drug often proves helpful. It seems hardly necessary to point out that the drug must be administered to full physiologic effect. Inhalation of amyl nitrite at the time of examination sometimes answers the purpose, but atropine in the form of tincture of belladonna is more efficient and reliable. Sixty drops of the tincture, divided into three equal doses, two of which are taken at an interval of two hours the evening before the examination, and the remaining dose within an hour before the examination, is a dependable form of administration.

Some attention should be devoted to the preparation of the enema itself. Since the roentgenoscopic observation of the opaque enema is the keystone procedure in the roentgenologic examination, the enema must contain a concentration of the basic opaque substance sufficiently high to yield maximal contrast. The opaque material in the enema should be minutely divided, uniformly suspended, and the suspension should be well sustained. Simple suspension in water by agitation is inadequate on account of the rapidity with which the salt is precipitated from such a mixture. Several commercial preparations of barium sulphate are available which are satisfactory in this respect, or a suspending agent, such as gum acacia, may be added to the mixture when it is prepared in the laboratory. The consistence of the suspension should approximate that of heavy cream. It is most important that the temperature of the enema be kept at or slightly above the temperature of the body, because the colon reacts violently at times to the direct application of cold.

With the patient in the recumbent position the enema is administered slowly and steadily, under constant roentgenoscopic observation from the time it enters the rectum until the cecum and terminal coils of ileum are visualized. This is necessary in order to detect abnormalities which may later be hidden by an overlying loop of normal bowel. As the examination progresses the patient is rotated from side to side to obtain views at different angles. These maneuvers, coupled with careful palpatory manipulation, are essential parts of the examination.

Although the roentgenoscopic observation of the opaque enema is the basic and cardinal roentgenologic procedure in the investigation of the colon, it must not be inferred that roentgenography is unnecessary or superfluous. A well executed roentgenogram will often provide invaluable supplementary information which was not

so clearly available at the roentgenoscopic examination. On the other hand, the practice of administering the opaque enema, and confining the investigation of the colon to the examination of one or two roentgenograms in different positions is so inadequate that it is mentioned here only in condemnation. Roentgenograms usually are made with the patient in the prone position. It will often be found necessary, however, to place the patient in an unusual position, or to use some form of compression so that the lesion can be projected on the film to best advantage (Fig 1).

Demonstration of mucosal relief.—This relatively new and very interesting method of investigation, sponsored especially by Knothe, Berg, Forssell and others, should be given a place among the valuable diagnostic procedures. Although workers in this field generally advise against the use of purgative agents when this method is employed, the examination of the mucosal relief can be carried on after the evacuation of the enema administered as has been outlined. Essentially the method consists of a study of the relief patterns assumed by the mucosa of the intestine covered with a thin coat of opaque material. The lumen of the colon must be thoroughly cleansed beforehand. The opaque enema is then administered under roentgenoscopic control after which the opaque material is evacuated. The mucosal relief is inspected both on the screen and on films. Experience at The Mayo Clinic with this procedure is too limited to permit a reliable opinion about its value. Correct interpretations of these not uncomplicated mucosal states will be born only of judgment acquired by long experience and carefully controlled observations.

The use of gases as contrast substances.—Long before the introduction of inert salts of heavy metals, investigations of the alimentary tract, especially of the stomach and colon, were carried on with the use of gases, chiefly air, as contrast substances. However, they never were universally employed. In special instances, when for some reason the use of opaque salts might be inadvisable or contraindicated, the inert gases may serve a useful purpose. It is possible to obtain a satisfactory outline of the colon by insufflation, but the picture lacks the distinctness necessary for accurate diagnostic work.

Combined methods of examination.—The first method, a combination of the opaque meal and opaque enema, hardly merits the name of a special procedure. It is applied only when the opaque meal has met with an obstruction and the opaque enema is used to determine the distal limits of the stenosis. The warning to exert every effort to prevent a large mass of insoluble and inert material from accumulating proximal to an obstruction bears repetition in a criticism of this practice. There is danger of impaction and complete intestinal obstruction.

FIGURE 1

The second method is a combination of the opaque meal and insufflation. Laurell, in 1921, described a method of examination of the proximal segments of the colon by administering the opaque meal, waiting until such time as the meal was transported to these segments (four to five hours), and insufflating with air. The same objections apply to this method as apply to the opaque meal when used alone. It has not received wide application, and is not nearly as useful as the following method.

The third method is a combination of the opaque enema and insufflation, or the "double contrast" method. Fischer, in 1923, described a method of investigation which will be found to be of greatest value especially for the demonstration of the nondeforming intraluminal lesion of the colon. Essentially the method is an attempt to coat the luminal surface of the bowel with a thin coat of opaque material, and then to distend the lumen with air. It thus provides what is in reality a transparent medium. Weber suggested several technical modifications which he believes makes the "combined method" more readily interpreted, and emphasized the value of stereoroentgenography with the technic. He pointed to the superiority of this method over all others for the demonstration of polypoid lesions and polyposis of the colon, and exhibited lesions not otherwise demonstrable roentgenographically.

The technic may be carried out to good advantage as follows: Complete removal of all solid, fluid, and gaseous accumulations is an unconditional prerequisite. The opaque enema is then administered under roentgenoscopic control. The colon is filled as rapidly as is compatible with the comfort of the patient and note is made of any abnormalities apparent. When the cecum has been filled the patient is allowed to evacuate the enema as completely as possible, and it is usually found that about the proper amount of the opaque material remains in the lumen of the bowel. No more than a uniform thin coat is desirable. If large collections of the material are

still seen after the attempt at evacuation the rectum can be insufflated with a volume of air sufficient to induce a desire for defecation, whereupon the patient will usually return with as near the ideal distribution and concentration of the opaque material as is possible in his case. A hand blower is used for insufflation. The colon is inflated under roentgenoscopic control, and care is exercised not to overdistend any of the segments. The procedure is facilitated by frequent rotation of the patient on the roentgenoscopic table, and by manipulation of the bowel through the abdominal wall. Insufflation carried out in this way has not been in any way more distressing to the patient than might be expected from the administration of the opaque enema.

As soon as the cecum has been moderately distended the enema tip is removed from the rectum and stereoroentgenograms are made with the patient in the prone position. The fluoroscopic image of the air-filled colon lacks sufficient detail to have diagnostic value. The grid diaphragm is of distinct advantage in educing the fine detail requisite for precise demonstration of the anatomic character of the lesions.

This technic is not recommended as a routine procedure. Compared with the barium enema it is cumbersome, relatively expensive, and may offer little additional information especially in those diseases which produce deformity of the lumen. Its greatest advantages lie in its adaptability for demonstrating otherwise obscure, small, nondeforming lesions, and those which may have been clearly and adequately visualized roentgenoscopically, but which are persistently obscured on the roentgenogram by overlying loops filled with dense opaque material. Unquestionably the method makes a valuable contribution to increased accuracy and general efficiency of diagnosis of diseases of the colon.

ROENTGENOLOGIC SIGNS OF CARCINOMA IN THE COLON

Early carcinoma.—Roentgenologic methods are expected to reflect only the gross anatomic characteristics of pathologic processes. From the histologic studies of Schmieden, Schmieden and Westhues, Doering, FitzGibbon and Rankin, and others, it is known that many polypoid lesions of the colon, benign grossly, are in fact carcinomas. Some of them have a tendency to develop malignant characteristics, and it has been shown very definitely that at least some well-defined malignant growths in the colon have their beginnings in these macroscopically benign polypoid lesions. The earliest stage of a malignant process, then, that the roentgenologic method is likely to uncover, is this type of lesion. The term "polypoid lesion" is used advisedly to include any sessile or pedunculated growth projecting into the intestinal lumen, without special reference to the his-

tologic nature of the tissue of which it is composed. It is not possible accurately to determine the cytology or the malignancy of such lesion without microscopic examination, but adenomas, fibromas, myomas and lipomas are the most common types encountered.

The significant roentgenologic features of these lesions are their intraluminal situation and their prevailing failure to produce a roentgenologically demonstrable deformity in the colonic contour. When these tumors are large and situated in segments accessible to palpation the roentgenoscopic examination will give reliable evidence of their presence. Without palpation a momentary split in the column of the enema as it ascends will most frequently be the only indication of the presence of a polypoid lesion. Approximating the walls of the colon, however, will serve to bring out the characteristic smooth, sharp, evenly rounded or ovoid contours of the central defect. The marginal contours of the colon may be unaffected. The wall of the bowel remains pliant, peristalsis is not hindered, and only rarely is a mass palpable in association. Ulceration, irregularity of contour of the polypoid lesion itself, evidence of induration or increased local rigidity of the wall of the colon at the site of the lesion, signify infiltration, hence malignancy. Thus it is apparent that the evidence for the presence of these lesions is largely roentgenoscopic. Roentgenography is successful only when conditions are favorable for approximation of the walls of the barium-filled bowel by compression. These considerations apply only to polypoid lesions which are large and which are accessible to manipulation at the time of roentgenoscopy. It is probable that polypoid lesions 2 cm. or less in diameter will almost always elude most careful roentgenoscopy, or will leave the examiner in an insecure state of mind regarding the reliability of his interpretation.

The opaque enema has not produced as reliable and accurate results in the demonstration of polypoid lesions of the colon as the opaque meal has yielded in the demonstration of similar lesions of the stomach. Before the "double contrast" method was available it seemed that the escape of many of these lesions especially of the smaller ones, from roentgenologic detection, was inevitable. But the use of this roentgenologic procedure has made it possible, not only to detect many more lesions of this type than was previously possible and to project them roentgenographically, but also to complement less decisive roentgenoscopic data with the precise intraluminal picture which the method provides. Polypoid tumors occurring singly or those relatively sparsely distributed, are visualized as rounded, soft projections into the intestinal lumen. Their contours are outlined vividly in the air-distended bowel, and it is possible, when sufficient care has been exercised in carrying out the details of the

FIGURE 2

technic, to determine the character of the surface contours of the growths (Fig 2). Properly applied, the method affords an estimate of the integrity of the interior of the colon attainable by no other method except direct visualization by the proctosigmoidoscope, or surgical or post-mortem exploration. Because the combination of air and a thin coat of opaque material applied to the mucosal surface provides what is essentially a transparent medium, the method is profitably extended to present more clearly a lesion which may have been more or less adequately visualized roentgenoscopically, but which is obstinately obscured in the roentgenogram by overlying loops filled with the dense opaque contrast material of the barium enema.

Mature carcinoma—Obviously most patients are sent for roentgenologic investigation of the colon when they have presented a syndrome directly or indirectly referable to a lesion in the colon. When carcinoma is responsible even for vague symptoms it has developed morphologically to the extent that it is not only roentgenologically apparent as a lesion but, with the exception of the polypoid lesions, its differential characteristics are manifest as well. This observation is based on experience with a considerable number of well-developed malignant lesions discovered roentgenologically in the course of routine examinations.

The filling defect is the essential roentgenologic sign which must be demonstrated before carcinoma can be diagnosed. The defect is defined as a subtraction from the normal outline of the colonic shadow, and may be central or marginal. It is produced chiefly by protrusion of the growth into the lumen of the bowel, and partly by diminished distensibility of the infiltrated wall. A certain amount of deformity is usually contributed by local spasm. The roentgenologic picture is in fact the shadow of a barium cast made with the lumen of the bowel as the matrix. Hence the filling defect produced by a given lesion will correspond with the luminal contours of the lesion. The extraluminal characteristics of the lesion are discernible only by inference from palpatory manipulation of the diseased area. It follows that the roentgenologic manifestations of carcinoma will vary within certain limits, depending on the morphologic character of the lesion encountered.

The filling defect of the scirrhous or fibrous carcinoma is short, and concentric. Its annular character is its most prominent feature. Ulceration is practically never demonstrable, and fixation to adjacent organs is rare, so that the lesion is uncommonly mobile. The tumor itself is usu-

FIGURE 3

FIGURE 4

ally so small that it is not palpable. The mass clinically so frequently associated with this type of lesion usually cannot be discovered at the roentgenologic examination if the preliminary preparation has been carried out faithfully. As in all instances of carcinoma, but particularly in this type of lesion, the demonstration of the filling defect is conditioned on the degree of patency of the involved segment. When the constriction is pervious to the enema, and obstruction of sufficiently high degree exists, dilatation of the intestine proximal to the lesion is apparent (Fig. 3). With these small annular lesions complete obstruction to the enema is most frequently encountered and the canal of the filling defect is not visualized. In most cases, however, the constriction has permitted the fecal current to pass in the physiologic direction. Retrograde obstruction is caused either by a high-grade diminution in caliber of the affected segment, or by the establishment of a valve mechanism in which lateral pressure is applied to the constricted area as the medium accumulates under force in the normally distensible bowel immediately adjacent to the le-

sion. In the former instance the barium column terminates in a conical, usually smooth, although sometimes ragged, projection (Fig. 4); in the latter, it terminates in two convex smooth eminences on each side of the central constriction.

The appearance of the polypoid type of carcinoma varies within wider limits, depending on the size of the growth, the extent of ulceration, and the amount of mural infiltration. Deformity of the luminal contour is not the most striking feature of these lesions. More characteristic is the presence of lobulated, cauliflower-like masses projecting into the lumen (Fig. 5). Displacement of the opaque material from their surfaces by ap-

FIGURE 6

proximating the walls of the affected segment with manual pressure presents the characteristic picture. Ulceration is revealed by the mass of opaque medium adhering to the ulcerated floor of the crater which is usually deep and bounded by irregular, overhanging margins (Fig. 6). In the cecum and ascending segments of the colon, the polypoid lesion commonly involves only a portion of the circumference, in the narrower, more distal segments, however, the entire circumference is usually included.

The filling defect produced by the third type of carcinoma of the colon is again quite uniform in appearance. The tumor protruding into the lumen of the bowel produces a constriction which is longer in extent than that produced by the annular scirrhus type. The luminal aspect

FIGURE 5

of the tumor is denuded and rough, which is reflected roentgenologically by markedly irregular and jagged contours and the tortuous course of the channel (Fig 7). The demarcation between normal and pathologic tissue is very abrupt, hence the termini of the filling defect have sharp contours, and tend to have a barbed or gnarled appearance. The tumor itself is usually large enough to be palpable through the abdominal wall, and the mass has the indurated knotty consistency associated with malignant tumors. Fixation may be present or absent. Complete or incomplete retrograde obstruction sometimes takes place, usually by the establishment of a valvular mechanism similar to that formed with the short annular lesions. The roentgenologic appearance differs, however, in that the distal terminus of the process is represented as two symmetrically placed sharp prongs to each side of the channel through the tumor.

DIFFERENTIAL DIAGNOSIS

When irregularity in the outline of the colon distended with contrast material is encountered, the first problem is to determine whether the defect observed is real or apparent. Spasm is the one factor which is operative in producing distortion in the contour of the colon which is not real, although the appearance may simulate closely that of a genuine intrinsic lesion. Spastic filling defects often show their true character by changing their form or situation. At times, however, they may persist unchanged for a considerable period. Manipulation of the involved segment sometimes effaces them, often they are absent at the second examination. The effective use of antispasmodic drugs, however, is the most satisfactory method of determining the amount of spasticity operative in producing a given deformity. Not infrequently gross deformities in the outline of the colon are produced by acute or fulminating inflammatory processes in adjacent or contiguous organs. This is due either to an extension of the inflammation to the serosal surface of bowel, or to reflex spasm. At times the spasm is so marked that the lumen of the bowel is closed completely. Such a filling defect is distinguished from one due to an intrinsic lesion by the notation that it usually involves a relatively long segment, that its outline changes its form during the examination, and that evidence of mucosal change is absent. Localized areas of spasm are also encountered which are apparently reflex from acute or subacute inflammatory lesions in abdominal organs distant from the area of spasm.

Other causes of apparent rather than real filling defects are local accumulations of gas, fluid and fecal matter in the colon. These can usually be displaced by palpation during the roentgenoscopic examination, and they do not have a con-

FIGURE 7

stant outline. Irregularities in outline caused by pressure from other organs such as the spleen and gallbladder, from intrinsic tumors and from adjacent bony parts are readily distinguished from true filling defects by determining their extrinsic situation during the roentgenoscopic examination.

Carcinoma is not the only intrinsic disease of the colon which is manifested by the filling defect. Other tumefactive processes which produce localized deformities in the outline of the colon are diverticulitis, specific and non specific granulomatous lesions and benign organic strictures.

Diverticulitis is encountered practically only in the segment of the sigmoid. The filling defect produced by this disease is the result both of spasm which may be so marked as to produce complete occlusion of lumen and of the encroachment of the pericolic inflammatory tissue on the lumen of the bowel. It is usually possible to visualize diverticula in the more proximal uninvolved segments as rounded, knob-like projections from the lumen of the colon. Differential diagnostic points are the concentric serrated contours of the affected segment contrasted with the sharply irregular and eccentric contours of carcinoma, the maintenance of flexibility in the former compared with the stark rigidity in the latter, and the long segment involved with diverticulitis as opposed to the relatively short segment which carcinoma usually occupies (Fig 8).

Hyperplastic tuberculosis, amebic granuloma and the mycotic affections of the bowel, named in the order of frequency of occurrence, are grouped together under the general term 'specific granulomas'. They are much more readily distinguished from carcinoma than they are from each other and from nonspecific granulomatous lesions. They are precarcinomatous diseases of the 'ceccocolon' although non specific granulomas and the mycotic lesions and less frequently hyperplastic tuberculosis, are encountered in other segments, especially in the sigmoid. The principal differential characteristic which all of

FIGURE 8

these lesions possess in common is the length of the segment which they encompass in their involvement. The demarcation between the normal and the pathologic is gradual rather than abrupt, the channel of the filling defect is concentrically placed, tends to have a smooth outline, or if irregularities in contour are present, they are rounded and bulbous rather than jagged and angular. When a mass is palpable with these lesions it does not have the indurated consistence of malignancy, but is boggier and more dough-like. The lesions usually are fixed, but pliable.

Quite rarely chronic ulcerative colitis, specific or non-specific, involves only a localized, short segment of the colon. An abrupt narrowing may be produced by such processes, and the moth-eaten appearance of the channel makes the lesion bear a strong resemblance to carcinoma. The divergence of the therapeutic procedure which hinges on the diagnostic decision makes the differentiation highly significant. This type of lesion usually shows marked irritability; its channel is relatively broad, its margins smooth, and the lesion is pliable in spite of the marked localized mural thickening.

Organic stricture is exceedingly uncommon except as a complication of chronic ulcerative colitis. A short segment is usually involved, but the narrowing is spindle-shaped, the lesion is pliable, and has a smooth and regular outline (Fig. 9).

Occasionally tumefactions extrinsic to the colon produce constriction of its lumen by completely or incompletely encircling it. Pelvic tumors and masses of metastatic nodes in the abdomen have been responsible for such localized encroachments on the lumen of the colon in our experience. In spite of the marked constriction, evidence of obstruction was entirely absent in the cases of this type which we have examined. The defect, however, has none of the characteristics which we have learned to associate with malignancy.

The roentgenologic profession points with just pride to the contribution its special method of observation has made to the diagnosis of carcinoma of the stomach. Contribution to the diagnosis of carcinoma of the colon is equally gratifying, and equally important, for 10 per cent of all malignant lesions which occur in the gastro-intestinal tract occur in the large intestine or rectum. Success in the treatment of patients affected with carcinoma of the colon may be expected to advance hand in hand with the development of refinements in diagnostic methods. It is probable that a great many of the failures in treatment are attributable primarily to the late stage at which the lesion was recognized. Roentgenologic methods make it possible to recognize carcinoma in its early stages, often before there is adequate clinical evidence for suspecting its presence. The message is obvious. The disease must be recognized earlier to permit the earliest possible institution of proper therapeutic procedures. Any changes in intestinal habit, evidenced by irritability, mucous diarrhea, alternating periods

FIGURE 9

of constipation, localized pain and tenderness which do not tend to disappear not to mention tumefaction, anemias, and obstruction all are indications for a most thorough going roentgenologic investigation of the intestinal tract. It is not out of place to recommend that this investiga-

tion be included in the routine yearly examinations. Such measures are necessary to increase the operability of the malignant lesions encountered in the colon, and simultaneously will offer much more reasonable hope for satisfactory end results.

THE SECOND DISTRICT BRANCH

The papers read at the scientific session of the Second District Branch of the Medical Society of the State of New York on November 19, 1931, have been assembled, and are printed in a group in this issue of the Journal. The complete program was as follows:

An address on Goiter by Dr. Martin B. Tinker, Ithaca, N. Y., guest speaker.

Three symposiums consisting of brief papers by physicians from Brooklyn:

- 1 The Polio Epidemic
 - (a) Statement of extent, mortality, etc. Herman T. Peck, M.D.
 - (b) Post-polio care from the standpoint of the 1. Pediatrician Benjamin Kramer, M.D.
2. Neurologist Harold R. Merwarth, M.D.
- 3 Orthopedist Herbert C. Fett, M.D.
 - 2 Pneumonia
 - (a) Types and typing Max A. Goldzieher, M.D.
 - (b) Serum therapy Thomas A. McGoldrick, M.D.
 - (c) Carbogen therapy John J. Wittmer, M.D.
 - (d) Supportive treatment Henry M. Moses, M.D.
- 3 Health Examination from the Standpoint of
 - (a) Urology Nathaniel P. Rathbun, M.D.
 - (b) Gastroenterology Albert F. R. Andresen, M.D.
 - (c) Ophthalmology John N. Evans, M.D.
 - (d) General Medicine Simon R. Blattes, M.D.
 - (e) Proctology Michael Canick, M.D.
 - (f) Cardiology William E. McCollom, M.D.

MEDICAL, SPECIAL, OR SURGICAL TREATMENT OF GOITER—A RECORD OF EXPERIENCE*

By MARTIN B. TINKER, M.D., ITHACA, N. Y.

THE best treatment of the vast majority of goiters is not medical or special or surgical only. Thyroid function has so important an effect on all organs of the body that no one man unaided can estimate all of its influences reliably. Decision as to the treatment suited to the case under consideration is best reached after group study, including an internist,

usually a roentgenologist and frequently other specialists. A capable, conscientious family physician is the key man in the case.

Preliminary treatment is frequently necessary and prolonged medical post-operative observation and care are almost always indispensable for the best results. A better understanding of the cause or causes of goiter is necessary before we can determine a logical form of treatment if a causative organism could be isolated it would make our problem much easier. Surgical treat-

* Read by invitation at the Meeting of the Second District Branch of the Medical Society of the State of New York at Brooklyn, N. Y., November 19, 1931.

ment is now generally accepted as giving the best results by the majority of progressive members of the profession. That there are still many who are reluctant to resort to surgery is evidenced by the fact that a considerable number of patients are allowed to go on to a hopeless condition before surgery is considered, if it is considered at all. Surgery in such desperate risk cases does not give as satisfactory results either as concerns danger to life or complete and permanent recovery. The unfortunate results in last resort cases, doubtless prevent many others who are good operative risks from coming for surgery at a time when a cure would be possible. Patients, and probably also many doctors, still overestimate the risk of surgery in uncomplicated cases. The question, often overlooked, is which really offers the greater risk; the disease or the operation which is under consideration for its cure. Many have come to me during the past 25 years with the statement "my mother died of goiter"; "my sister died of goiter"; "my friend died of goiter"; "my neighbor died of goiter." The number of these fatalities has been so great where there had been no surgical intervention of any sort that 12 years ago I decided to keep a list of such cases. The information given me is, I believe, authentic: in almost all cases we have the names and addresses of those who died; also the name and address of the person furnishing the information. In twelve years, 138 such patients have been reported to me. This is approximately five times as many deaths from goiter, the disease, without surgery as could be fairly attributed to my own operations in the same period of time. Seventeen of these patients choked to death; 44 of these patients have died from symptoms which have affected the heart; 68 have died of thyroid toxemia, and four have died of malignancy. In this same period four patients have developed gangrene of the extremities. Three of these patients were not operated upon: 2 died; in one of these cases the post-mortem examination showed a large clot at the bifurcation of the abdominal aorta which had caused gangrene of both legs in the short time after acute symptoms developed. In the third case gangrene of the left leg developed extending to the middle of the thigh and necessitating an amputation. This patient was in the hospital at the time her trouble developed but because of the development of gangrene she was sent back to her home city; the surgeon in charge waited several weeks until the line of demarcation formed and then amputated successfully; she has recently returned to me for removal of her goiter and returned home well 3 months ago. In these cases it seems likely that the cardio-vascular changes were the result of long continued thyroid toxemia. Early group studies and operation would probably have averted the unfortunate outcome in the vast majority of these 141

cases. The results reported from a number of clinics where careful methods and large experience have given the most favorable conditions, indicate that the mortality in goiter operations need not exceed one-half of one per cent.

Group study indicates that there is need for more or less prolonged medical or special care in preparation for surgery with at least 32.4% of the patients who come to us. Damaged hearts most frequently require attention. 6.7% have auricular fibrillation: a pulse deficit chart is kept as a routine in such cases. Rest in bed and the use of some digitalis preparation usually clears the pulse deficit within one or two weeks. If this condition or any other condition requiring preliminary medical care does not improve satisfactorily within ten days or two weeks we frequently send the patient back to his home under the care of the family physician. In a good many instances rest and care over a period of from two to six months will give such improvement as to warrant operation.

Apparent diabetes has been present in six cases during the past 22 months. These patients can be made sugar free by suitable dietetic care alone or combined with insulin. Some patients, who have seemed in the most serious condition and who have had a weakened heart muscle with auricular fibrillation as well as other symptoms of thyroid toxemia besides the glycosuria, have cleared all symptoms and have come back in apparently perfect health without diabetic treatment several months to a year or more following thyroidectomy.

A blood picture of pernicious anemia has been present in 3 cases during the past six months. This is a somewhat larger number than the average during the past 25 years. It has been possible to improve the blood picture sufficiently to warrant operation in all of these cases by conservative measures: iron and other tonics, beef juice, overfeeding, and rest in the open air. The permanent results seem to be satisfactory in all cases.

High blood pressure, above 200 systolic or 100 diastolic, should be brought down by preliminary treatment if possible. Low protein, salt free diet; rest in bed, and frequent saline purges have given us good results in many cases. Permanent satisfactory improvement following partial bilateral thyroidectomy in cases without serious organic changes has resulted in about one-third of the total number who have come under my observation. The blood pressure has remained at 150 or considerably lower for ten years or more with several patients who had a systolic pressure of 250 before operation.

Gastro-intestinal symptoms associated with goiter may be chronic or acute. Chronic symptoms may require a barium meal and enema with Graham test x-ray, protoscopic examination or other special studies to determine whether the trouble is caused by some organic lesion. Atten-

tion has been called in previous papers to the fact that pronounced gastro intestinal symptoms contraindicate surgery, most frequently persistent nausea and vomiting or persistent diarrhoea

Nervous and mental conditions occur with considerable frequency, but do not always require the attention of a specialist. Many of these patients have been treated for neurasthenia, others have a good deal of nervous and mental instability which has never been given special treatment. The various neuroses and psychoses are probably generally considered the result of disorders of the vegetative nervous system. Epilepsy associated with goiter is occasionally seen. Four such cases have come for operation during the past ten months. There is the usual temporary benefit following any major operation, but nothing can be promised as regards permanent relief. The associated thyrotoxicosis doubtless aggravates the condition in many instances and with the advice and treatment of a competent neuro-psychiatrist a number of these patients have remained well for several years. Parkinson's Disease with toxic goiter is a relatively rare condition. Wechsler and Savitsky *Jour Am Med Assn*, p 1283, vol 97, 1931 has recently reported two cases and given a satisfactory review of the literature. The results of surgery in the cases reported in the literature and my own experience have been satisfactory as regards improving the patient's symptoms and general condition although a complete cure would, of course, not be expected.

Patients who are actively insane or who have been inmates of hospitals for the insane doubtless come to the attention of most men who see large numbers of goiter patients. Several psychiatrists who have referred patients to me believe that thyrotoxicosis is the important causative factor. A number of cases have been seen with members of the staff at Willard State Hospital where I have been consulting surgeon for several years. Five such cases have come under our observation during the past year. If first the mental condition can be fairly satisfactorily cleared, operation seems to be followed by satisfactory results, a considerable number of these patients remaining permanently well. The results of operating upon patients actively insane have not been encouraging, however. Akromegaly is occasionally seen in association with goiter. This is not surprising considering the well known relation between the pituitary and the thyroid. Sutherland Simpson found definite hypertrophy of the pituitary in animals, an increasing weight of several grams being noted in animals that had had the thyroid removed. The akromegaly patients should, of course, have the benefit of preliminary study and post operative supervision by a competent neuro psychiatrist. With such co operation the results are frequently far better than one would dare to expect.

Preliminary study by an ophthalmologist and oto laryngologist is desirable in the majority of cases and post operative care is frequently important, during and after hospital treatment. The importance of eliminating focal infections of sinuses, nose, throat (especially tonsils) and teeth need special emphasis. Unless such infections are cleared patients frequently fail to get permanent satisfactory results. The condition of the vocal cords is also highly important. Occasionally patients come in with paralysis of one cord and it is important to know this rather than to have it attributed to operation. Bilateral paralysis, a rare complication, is, of course, a serious matter. Ulceration of the cornea deserves special mention. I have seen several bad cases. It is certainly too dangerous to vision to warrant care by any except specially trained men. In one instance, with loss of an eye, the condition unfortunately affecting a physician, came to my attention, although this patient was not under my care at the time.

X-ray is of great value in pre operative diagnosis and radium or X ray are essential in the treatment of most cases of malignancy post-operatively. It is also highly important to know the amount of compression or displacement of the trachea which may exist before operation. Frequently these patients breathe fairly well unless there is slight increase of obstruction, such as comes from some inflammatory condition or slight compression during operation. It is especially important to know the location and size of intrathoracic goiters, for if this is known plans can be made for their successful removal.

The cases of malignancy are clinically of three kinds: those patients in which the diagnosis seems reasonably certain before operation, those in which the diagnosis is made by pathological examination after operation, and those in which the goiter is apparently benign, both as concerns clinical symptoms before operation and pathological examination after operation, but in which there is metastasis, most frequently affecting the flat bones, the growth having the gross and microscopic characteristics of a benign goiter. Many of these patients make satisfactory progress with radium treatment combined with surgery as noted in several previous papers. In a majority of cases the condition is adenocarcinoma which metastasizes quite late and is decidedly radio sensitive. A considerable number of my patients have remained well for from 5 to 15 years following excision and later radiation.

The deplorable remote results of long continued medical treatment which have been enumerated, especially long continued iodine treatment warrant a more active policy on the part of a certain number who have such patients under their care. The results of co operation in the study and treatment of such cases are certainly most gratifying.

THE POLIOMYELITIS EPIDEMIC

By HERMAN T. PECK, M.D., BROOKLYN, N. Y.

I HAVE been asked to give you a statement on the extent and mortality of the recent poliomyelitis outbreak in New York City. There are three diseases which, while endemic, require close observation and intensive action from a preventive viewpoint, and in connection with which we chart the daily incidence on pin maps, changing the color of the pins at regular intervals to indicate evidence of grouping and the possible increase in incidence. One of these diseases is poliomyelitis.

While poliomyelitis had not visited the City in epidemic form since 1916, we are continually on the alert concerning its prevalence, and the more so in 1931, for the reason that during 1929 and 1930, the incidence was especially low.

During the first half of 1931, the normal endemic incidence prevailed. Early in July, the reported cases began to be more frequent and evidence of grouping was noticed in certain locations where the 1916 epidemic first appeared.

Whether the virus of poliomyelitis is widely disseminated as it is generally believed and the majority of the population have become immune due to a previous infection not leading to paralysis, or whether it is an actual contagious disease transmitted by contact, the Department felt that all precautions should be taken not only to prevent the transmission of the disease but, also to see that all the sufferers were placed as early as possible under the most competent medical supervision to avoid the possible after-effects of the accompanying paralysis.

The first step after devising plans was for the Commissioner to call a meeting of the Medical Advisory Board of the Health Department and the representatives from the five County Medical Societies, for discussion of these plans, and to receive such suggestions and advice as they might desire to give. The plan suggested by the Health Department was approved and it was also agreed that before any publicity should be given to our campaign, that the individual physician in New York City should be notified of the increased incidence of this disease, and the possibility of an outbreak occurring during the Summer, and his cooperation and assistance requested. Although this meeting was held on Thursday, a circular was prepared and addressed to every physician in New York City, forwarded and received by them by the following Monday morning. Their cooperation in notifying the Department of all suspected cases in the pre-paralytic stage was urged, and a corps of especially trained physicians familiar with the operation of lumbar puncture and the injection of convalescent's serum was placed at their disposal through the Department's Meningitis Division.

In order that no hidden cases might exist throughout the City, we caused a survey to be made by the nurses of the Department in those areas showing the increased incidence, and while about 15,000 families were visited, only three cases of actual poliomyelitis, not previously reported, were found.

With this cooperation of the medical profession and all the allied nursing and social service organizations and the public press, we were able to hand the 4,080 cases which were reported up to November 1st, without the fear and apprehension which pervaded the country during the 1916 epidemic.

Of these 4,080 cases reported up to November 1st, only 34 cases occurred previous to July 1st.

It is gratifying to report that of these 4,080 cases, 3,112 or over 76% received hospital treatment, and only 466 resulted fatally which is slightly over 11%, in contra distinction to a mortality of 27% for 9,023 cases in the 1916 epidemic.

Another interesting thing confirming the alertness of the medical profession in their cooperation with the Department during this outbreak was that Dr. James D. Smith, Medical Director of the Contagious Disease Hospital of the Department of Hospitals reported in the September 5th Bulletin of the Department of Health that only about 17½% of the cases treated in the Contagious Disease Hospitals during the pre-paralytic stage actually developed paralysis.

We have kept from week to week a tabulation showing the age groupings of the cases by years from 1 to 10, at 5 year intervals between 10 and 35, and from 35 years of age and up, as well as by sex of the cases.

Of the 4,080 cases reported, there were 182 in which the age was not given, the tabulation therefore being for 3,898 cases. This tabulation shows that the disease was considerably more prevalent among males than females, 2,255 males as against 1,643 females. It also shows that over 53% of the cases were under 5 years of age, that slightly less than 31% were between the ages of 5 and 10 years; in other words, 84% of the reported cases were under 10 years of age, and that only about 16% were over 10 years.

Of this 16%, over 10 years, 13% were in the age groups between 10 and 20, leaving only 3% of the reported cases that were over 20 years of age, and these gradually diminished as the age increased.

While poliomyelitis is recognized to be a communicable disease, the prevailing theory that the virus is wide-spread and that the majority of adults at some time have acquired immunity through an actual invasion with the virus with-

out terminating in paralysis, would seem to be borne out by the above figures showing the great majority of the cases reported in 1931 to have been borne since the epidemic of 1916 15 years ago, and by the further compilation made by the Department which shows that of 4,080 cases reported only 95 families had two cases, and 3 families had 3 cases during the present outbreak.

Now, if we consider 10 to 14 days as the incubation period, it is interesting that 85 of these 101 cases developed within 10 days which would

indicate a source of infection other than actual contact infection from the original case, 10 cases developed between the 10th and 14th days and are therefore doubtful and only 6 developed after 14 days. In other words, there are only 6 cases out of 4,080 reported that could be considered purely contact cases according to our present conception of secondary cases as applied to other contagious diseases. Poliomyelitis having now returned to its normal endemic state, the next speakers will tell you about Post Poliomyelitis care.

ACUTE ANTERIOR POLIOMYELITIS

Preliminary Report

By BENJAMIN KRAMER, M.D., BROOKLYN, N. Y.

THE epidemic of 1931 afforded an opportunity for a more complete understanding of the nature of this disease and made possible an evaluation of certain suggestions for its treatment. Our efforts were concentrated upon three things: First—the recognition of the disease in the pre-paralytic stage; second—the study of the value of a tested convalescent serum; third—an evaluation of the Drinker Apparatus in the treatment of respiratory paralysis. The present communication is concerned with the presentation of statistical data and with a preliminary report of our results with the use of serum in pre-paralytic cases.

Our patients may be divided into two groups: (1) those studied during the early part of the epidemic, in which serum obtained from the Board of Health, New York City, and the N. Y. Academy of Medicine was used; (2) those studied in collaboration with Dr. S. D. Kramer, representing the Harvard Infantile Paralysis Commission. The latter group will be reported in detail by Dr. Kramer and his co-workers. Our report is a preliminary one and includes all the patients admitted to the Infantile Paralysis Service of the Jewish Hospital of Brooklyn.

The total number of patients admitted was 98. These were equally divided between the sexes, there being 48 males and 50 females. The age distribution in our small group ran parallel to that in the city as a whole. Ninety per cent of the patients were less than 10 years of age. More than 50% were less than 5 years of age, the highest incidence being between 2 and 5 years. Fifty-four of our patients were observed in the pre-paralytic stage. Forty-four had more or less paralysis, varying from slight weakness of one limb to severe bulbar involvement, at the time of admission to the hospital. During the latter part of the epidemic we confined ourselves chiefly to the treatment of patients in the pre-paralytic stage. Patients with respiratory paralysis were admitted in order to give them the benefit of

treatment with the respirator. Of 24 patients in the pre-paralytic group who received no serum, 18 recovered without paralysis and 6 developed paralysis. Of the 30 who were treated with serum 18 recovered and 12 developed some form of paralysis. Of the 44 patients admitted in the paralytic stage 8 showed a purely bulbar type of paralysis, 12 a bulbo-spinal and 24 a purely spinal involvement. The extent of involvement and the outcome in these patients are indicated in the charts.

In the Drinker Respirator, Dr. Drinker has given us a new instrument to combat respiratory paralysis. The indications for the use of this instrument, the management of the patient while in the respirator and a detailed discussion of the results will be presented in a later communication. Here, I merely wish to summarize our results.

We offer the following conclusions, some of which may be modified by a more complete study of our data.

1. In our small series 90% of cases occurred in children less than 10 years of age.

2. The condition was diagnosed in many before paralysis developed.

3. The incidence of paralysis in the treated cases was certainly not less than in the untreated.

4. Comparative mortality statistics of treated and untreated cases are of no value, cases insufficient in number.

5. Respirator of value only in spinal type of respiratory paralysis, not in the bulbo-spinal or bulbar type.

6. Ten patients were treated in the respirator. Of these 2 improved and 8 died. The two who recovered were of the spinal type.

It is indeed a pleasure to express our appreciation of the invaluable cooperation given to us during this study by the Board of Health of the City of New York, particularly by Dr. Peck and those physicians working under his direction, and by the physicians in charge of the hospitals for

contagious diseases under the Department of Hospitals. Needless to say, this work could not have been done without the consent and cooperation of the President and Board of Directors of the Jewish Hospital and also the Director of Professional Activities, Miss Pillsbury.

Summary of Poliomyelitis Cases

The following is a preliminary summary of the infantile paralysis cases admitted to our wards during the summer of 1931. A more detailed and minute analysis is to follow.

I. Total number of patients admitted—98.

Female—50.

Male, 48.

		Age Incidence		
		(7 mos.—10 mos.)	(10 mos.—11 mos.)	(11 mos.—12 mos.)
0-1	5	51	(1)	(2)
1-2	3			
2-3	10			
3-4	16			
4-5	17			
5-6	7	37		
6-7	9			
7-8	9			
8-9	5			
9-10	7			
10-11	1	10		
11-12	1			
12-13	1			
13-14	1			
14-15	3			
15-20	1	10%		
20-25	1			
30 yrs.	1			

Total 98

II. Types of Cases

1. Preparalytic 54

2. Paralytic 44 (a) Bulbar 8
(b) Bulbo spinal ...12
(c) Spinal24

Pre-paralytic Cases (Treatment and Results)

(a) Treated with serum 30

Recovered (without paralysis) 18

Developed Paralysis 12(40%)

Bulbar (died) 1

Facial weakness (unimproved on discharge) 3

Right upper and lower extremity .. 2

Right lower 1

Left lower 1

Both lower 1

Both lower and shoulder 2

Quadriplegia 1

12

(b) Treated without serum 24

Recovered 18

Developed paralysis 6(25%)

Weakness of ant. abdominal muscles. 1

Right upper extremity 1

Left upper extremity 1
Left upper and lower extremity 1
Both upper extremities 2
—
6

Paralytic Cases—44

(a) Bulbar—8

1 died in respirator

1 recovered completely

1 only right 6th nerve involved—unimproved

1 right facial-nasal voice—improved

4 facial nerve weakness alone—unimproved

—

8

(b) Bulbo spinal—12

5 died in respirator

2 (a) 9th and 10th nerves and (b) 2 extremities—(a) recovered, (b) improved

1 (a) 7, 9, 10th nerves, (b) 1 extremity—all improved except facial

2 (a) 7th and (b) 2 extremities—(a) 7th same, (b) improved

2 (a) 7th and (b) 1 extremity—(a) 1 improved 1 same (b) improved

—

12

(c) Spinal—24

2 died in respirator

2 improved in respirator

5 developed progressive paralysis

(a) 2 quadriplegia

(b) 3 three limbs involved

1 recovered completely

6 improved considerably by time of discharge

8 unimproved

—

24

Respirator Cases—10

Bulbo spinal—5 died

Bulbar 1 “

Spinal—4 2 “

2 improved.

III. Final Summary of Results

Completely recovered 46 47.0%

Died 9 9.2%

Residual facial weakness on discharge 7 7.1%

Residual 6th nerve palsy on discharge 1 1.0%

Residual quadriplegia 4 4.0%

Residual involvement of 3 limbs.. 4 4.0%

Residual involvement of 2 limbs.. 12 12.2%

Paralysis with atrophy.. 6

Weakness only 6

Residual involvement of 1 limb... 15 15.3%

Paralysis with atrophy .. 7

Weakness only 8

Conclusions

- 1 In our small series 90% of cases occurred in children less than 10 years of age
- 2 Condition was diagnosed in many before paralysis developed
- 3 The incidence of paralysis in the treated cases was certainly not less than in the untreated

4 Comparative mortality statistics of treated and untreated of no value, cases insufficient in number

5 Respirator of value only in spinal type of respiratory paralysis, not in the bulbo spinal or bulbar type

POLIOMYELITIS: NEUROLOGICAL COMMENTS

By HAROLD R MERWARTH, M.D, BROOKLYN, N. Y.

WE are face to face with a *public enemy*, one ever with us, slinking, unsuspected often unrecognized, when striking out of season (sporadic cases). It is a fearsome, sinister shadow bringing terror in a well-guarded mansion, or skulking unrestrainedly in the darkest recesses of the humblest home. What a mysterious rambler! It is ever puzzling in its wanderings now weaving bizarre patterns in the most congested sections of the crowded city, or in a devilish fashion invading an apparently well-isolated homestead.

This enemy, playing so cruelly on our heart strings is a general systemic infection, fundamentally lymphogenous. In epidemic form it is widespread in the number involved without paralysis. Fortunately only in a small percentage of cases does it occupy the center of the stage, because of the crippling effects, resulting from the involvement of the central nervous system.

So much attention has been focused on the most striking feature of the disease, the paralysis, that equally distressing symptoms due to involvement of the autonomic nervous system receive little attention. We are all familiar with the mottled, bluish discolored, cold, paralyzed extremity. Complaints of the leg feeling cold or of contrasting cold and warm spots, or even of dull burning sensations, are received. Objectively the surface of the extremity may feel cold or warm to the touch. This vasomotor disturbance may be mild or severe, of brief duration or persistent. In some cases there may be vague annoying gastrointestinal disturbances of a prolonged, harassing nature. It is known that the motor cells in the lateral horns of the thoracic cord, the governing cells of the sympathetic system, show pathologic changes. Also chromatolysis has been observed in the extraspinal autonomic ganglion cells, which control visceral function. Many symptoms of a rather intangible nature are probably due to changes in the "vegetative system." Possibly the cases of pronounced fatigability on exertion, which otherwise seem well, may be so caused.

The return of the deep reflex tendon response is looked upon justly as an indication of improvement, just as its loss is concrete evidence of the establishment of the disease in the central ner-

vous system. However, there are a few cases in whom, despite the apparent return to normalcy of the affected muscles, the deep reflex tendon response remains lost. The exact mechanism of the phenomenon is not clear. As is well known there are a small number of adult humans, otherwise normal, who have lost, or possibly never had, deep tendon reflex responses. I have known two members of the medical profession who regarded their lost quadriceps and Achilles jerk with a sort of pride and challenged their production. We must place the failure of the deep reflexes to return in the same unexplained category.

The finding of an isolated, complete, peripheral facial paralysis is a rare occurrence. I have seen cases so diagnosed but subsequent careful investigation proved other causes. One such case in a child proved to have a definite loss of taste on the affected side. In company with other cranial or somatic nerves during the acute phase, it is not uncommon.

It is possible to have it persist as an entity after the other paralyzed nerves recover.

The facial nucleus is rather extensive, and may be but partially involved. When this situation occurs, the result may simulate a supranuclear type of facial palsy. However, in the latter the discovery of other pyramidal tract signs or the preservation of the emotional control should make the localization clear. As a rule most of the facial palsies recover.

Pain may be completely absent throughout the illness or it may dominate the picture. It is well known that in the pathologic analysis the essential lesion is in the motor cells in the anterior horn but is not limited to these cells. Destructive changes are found in the posterior ganglion cells, despite which shingles is rare. Inflammatory reactions occur in the meninges and in the posterior roots. To the implication of the sensory side are due many of the early diagnostic signs—stiff neck, stiff back (spine sign) and the lower leg resisting hyperextension.

In the first few days of the acute phase, firm pressure over the muscles may be exquisitely painful. Much of the anxiety of the patient is due to the fear of harsh handling of these muscles. That pain exists in the muscle, and

that careless handling is objected to, is shown by the following instance:

A boy of fourteen, the son of a physician, was suffering from a cervical bulbar type of paralysis. Vomiting was extreme. The patient persisted in turning over on the side to vomit. In so doing it was necessary to support his head. On one occasion the usually vigilant nurse withdrew her supporting hand from beneath his forehead. His head fell forward. At once he screamed to have the head held up, and yelled that the pain in the back of his neck was awful. His agony for this brief moment was pitiful. At the same time it was impressive. Passive forward flexion of the neck had not been resisted (stiff neck sign). It was only when unexpected tension had been put on the weakened muscles and ligaments that excruciating pain developed. This pain seemed to be due to intimate changes in the muscles rather than stretching of the posterior roots.

The chronic pains persisting for weeks or months after the subsidence of fever may be due to one or several factors—a residual on the sensory side, painful weakened muscles, contracted muscles placed on the stretch, or unduly relaxed ligaments. The exact nature will have to be determined by a careful examination. In some cases despite the best of care and obvious progressive improvement, dull intractable pains may form an awkward phase of the case.

An undergraduate nurse, in intimate contact with "a polio ward" was taken ill with the disease. It was easily recognized and immediately treated. Muscular weakness developed, which under appropriate physiologic rest recovered completely. General diffuse pains persisted throughout her course in the hospital, was present on discharge and still complained of on her return in three months time. She had gained in weight, improved in her morale, and seemed anxious to return to nursing duty. After one day's nursing duty intense muscular soreness developed associated with a feeling of intense fatigue. Examination at this time, showed absolutely no muscular weakness, or change in the deep reflexes. All tests were normal except for a slight muscle tenderness. The symptoms of pain and exhaustion following moderate exertion are indications for a more prolonged rest. It is interesting that for a period these pains were thought to be psychogenic in character.

The psychic aspect of this disease in the acute phase has received much attention from many observers. In this stage the extreme degree of morbid anxiety is recognized as one of the classical symptoms. A vague apprehension, an unexplainable feeling of impending disaster are commonly experienced in those capable of explaining their reactions. A never-ending curiosity is frequently found in the older child, while even in the very young, the inarticulate, we find an ever-alert watchfulness, which we recognize as a fea-

ture of this illness. Certain physical accompaniments such as ill-appeared restlessness, and fine muscular twitchings, preparalytic forerunners complete the picture.

As contrasted with many acute illnesses in children there rarely is any clouding of the higher centers except when the child is on the brink of disaster. Then only may lethargy, stupor or coma supervene. Picture the rarity of convulsions in this illness. A full retention of consciousness is characteristic. To me the child is alert, and impressive with its mental keenness in the presence of fever. A marked irritability, a general resentfulness are found but are an expression of a strong desire to be left alone.

In the chronic phase in those who have a residual paralysis the psychic picture varies. In the very young there is no real appreciation of the disability or its significance. As the child grows older complications arise. There is a period especially in boys when an apparatus such as the spectacular airplane splint for a weakened shoulder group, is worn proudly in the spirit of a hero. This period of glory is brief. The glamour fades quickly. In the passage of time the immediate natural sympathy for another's distress is forgotten. Children are notably straightforward, at times cruel, and particularly apt in their descriptive nicknames. The child may be neglected or taunted for its awkwardness. Fortunately with the improvement in the average general care throughout the community the percentage of those with extreme disabilities is lower.

When the full significance of the ailment penetrates the child's consciousness an adjustment must be made. In our present system in the various relations, social, economic and with the opposite sex the advantage lies with the boy. On the particular dominance of the constitutional personality traits in the "long thins" or the "short thicks" depend much of the innate ability to make a readjustment. The former already shy, retiring, sensitive, requires more careful watching. The child may shun society, become depressed, and develop severe introversion. A spirit of combativeness, marked self assertion, so often seen in the male of slight physical structure may mar the personality.

This illness can and does cause a permanent physical disability. In no way does it impair the pure reasoning powers. Man's power to think, invent, create, or legislate, is at the same high level. I have yet to see one case of undoubted polio with any change in the mental status. This disease with its pure physical manifestations should not, because of a weird twist of fate, embarrass a person's chances for any executive position, even that of the presidency of the United States. In our own profession there are a few, crippled from childhood, whose accomplishments under great handicaps, reflect great glory on us all.

THE ORTHOPEDIC TREATMENT OF ANTERIOR POLIOMYELITIS

By HERBERT C. FETT, M.D., BROOKLYN, N. Y.

MUCH has been written recently of the after-care of the victims of Anterior Poliomyelitis and very little has been added to the routine treatment which was carried out after the epidemic of 1916. Our experiences in 1916 taught us a few essentials which I would like to stress in this short paper.

First—That orthopedic treatment should be started as soon as possible after the disease is recognized. I stress this point for several reasons, primarily because of the relief from pain. The painful extremity which accompanies the paralysis can be almost completely relieved by immobilization in a plaster of paris cast or some other means of satisfactory splinting. Plaster of paris is very satisfactory because one can be sure of complete immobilization and the maintenance of the proper position. The warmth of the cotton and flannel used under the plaster is a great aid in overcoming the accompanying neuritis.

Secondly, because we have learned that in order to obtain restoration of muscle function it is absolutely necessary to relax the muscle which has been paralyzed so that its origin and insertion are brought close together. The immobilization mentioned above will accomplish this very satisfactorily. It is very difficult early in the course of the disease in some cases to differentiate the various group paralyses, so that in order to relax the muscles it is safe to put the extremity in a neutral position. Later the cast can be changed and the muscles involved further relaxed.

Thirdly—Immobilization early in the disease by lessening the pain greatly facilitates the nursing care.

Fourthly—Immobilization early in the disease in the proper position prevents the development of deformities which is one of the most important duties of the orthopedic surgeon. Once deformities have occurred it is usually necessary to resort to some form of painful cure by manipulation or the stretching under anesthesia or surgery.

Fifthly—By relieving the pain of our little patients we earn their sincere gratitude which is a valuable aid to us later in the treatment when their earnest cooperation is absolutely essential.

And lastly I stress the point of early orthopedic care because the general opinion seems to be that the acute stage of anterior poliomyelitis is wholly a problem for the Pediatrician.

The second point which I would like to stress is the care during the convalescent stage. You are all familiar with the various forms of treatment, namely massage, muscle re-education, diathermy, and other forms of electricity, infrared ray and hydrotherapy. I shall not go into the details of these various forms of therapy but

I would like to dwell on the practical use of the hydrotherapy. I usually instruct the parents to fill the bath tub with hot water 95 degrees to 100 degrees and to add some sea salt about two tea-cupful. The child is placed in the tub and the exercises done with the extremity under water, care being taken not to overfatigue the muscles. Much more motion can be obtained while the extremity is under water because of the buoyancy of the salt water. The hot sea salt bath is also a valuable aid in overcoming the neuritis. The use of the bath at home avoids transportation to a pool or tank with the consequent chilling of the body when the child is taken home and undoubtedly avoids the contracting of colds, pneumonias, etc. It also saves wear and tear on the parents.

Hydrotherapy may be safely started as soon as the febrile stage has subsided and the pediatrician feels that it is quite safe from a constitutional standpoint to move the child from the bed to the bathtub. A posterior splint may be made of the plaster cast to facilitate the bathing. The hydrotherapy should be continued throughout the convalescent stage. Baths may be given daily. The child remains in the bath for twenty minutes to three quarters of an hour. Hydrotherapy is useful in the chronic stage after muscle transplantation.

I also wish to impress the necessity for the greatest patience and gentleness in the handling of these children by the physician, nurse and physiotherapist. As has been previously mentioned we must obtain and maintain the confidence of these children in order to get their best cooperation for the muscle re-education as they are all highly excitable and apprehensive. We therefore must eliminate any measures which are painful such as forceful stretchings, deep massage, strong electrical currents, etc.

It has been my practice to precede the massage and muscle re-education by the use of the infrared ray lamp for fifteen minutes at a distance of about twenty four inches. The muscles respond better if the extremity is warm. To further carry out this principle the parents are instructed to keep woolen stockings on the lower extremities. For protection of the upper extremities, back and abdomen a woolen sweater is used.

Massage and muscle re-education should be given by trained attendants only. These attendants must know anatomy and physiology as well as a thorough knowledge of the art of massage. Much damage can result from overfatigue of muscle or the stimulation of the wrong groups of muscles. The use of the electrical currents should not be countenanced unless the individual giving these treatments is a physician well trained

in anatomy and physiology therapy or by an attendant trained by a physician and the treatment carefully supervised by a competent physician.

Rest during the convalescent stage cannot be overemphasized whether the involvement is in the back, abdomen, upper or lower extremities. This applies particularly to the back because of the possibility of developing a scoliosis which is one of the greatest "bugaboos" of the orthopedic surgeon. Where paralysis of the back muscles is present a scoliosis will often develop in spite of the best of care. During this period of rest the paralyzed muscles must be carefully protected against cold and the development of deformities. It is difficult to state how long this period of rest should last but it has been my custom to have these children refrain from weight bearing until I have obtained what I consider the maximum amount of return of function in the paralyzed muscles. This may extend over a period of two years or more. During this time the child's general condition must be carefully observed particularly in reference to its weight because of the tendency to obesity as a result of the inactivity. The Pediatrician can be of considerable service in solving this problem. Much difficulty is encountered while enforcing this rest as the parents are always anxious to see the child stand and walk and therefore are frequently putting the offspring through a series of stunts. Naturally the child finds out that it can stand or walk and consequently thereafter the parents find it practically impossible to control the child's activity. It is therefore mandatory that proper instructions be given these parents along these lines as soon as treatment is started.

It is a well-recognized fact that no massage or muscle re-education should be started in these cases until all pain on motion, muscle tenderness and nerve trunk tenderness have completely disappeared. In some cases this pain and tenderness may extend over a period of two to three months. In most cases it will have completely disappeared after four or five weeks.

During this stage the Bradford Frame is an excellent piece of apparatus for enforcing rest,

particularly for the back. An aeroplane splint serves the same purpose in cases of upper extremity paralysis. If one chooses to use a brace for the lower extremity it is usually necessary to attach some form of stabilizer to prevent external rotation of the leg, such as a spike which projects from each side and rests on the bed. Aeroplane splints and foot supports can be attached to the Bradford Frame if necessary. For the abdominal paralysis it has been my custom to use a canvas abdominal binder.

The treatments can best be carried out at home where the child is most comfortable and composed. This eliminates transportation and exposure to cold and insures complete relaxation and rest after the treatment. The treatments should be given on a smooth top table which will eliminate all resistance. The case should be assigned to a worker who treats the child throughout the entire convalescent stage. Changing of workers is not conducive to the best end results.

The third point which I wish to emphasize is the operative treatment for the correction of deformities. This phase of the treatment is usually reserved for the chronic stage of the disease which has been known as the two-year period. It is not absolutely necessary to wait until two years have elapsed before deciding to operate for the correction of a deformity. If we find that a child is developing a curvature of the spine in spite of the best possible treatment I feel that one is justified in suggesting a spine fusion to prevent a progression of the curve. The same applies to the other extremities. An operative procedure is justifiable after the observer feels that the maximum amount of improvement has been obtained.

Stabilizing operations produce excellent weight bearing feet. Stabilizing operations produce excellent functional upper extremities. Stabilizing operations on the spine and extremities have made it possible to discard many braces, crutches and plaster of paris casts. Muscle transplants have done likewise.

Combinations of these procedures have made it possible for otherwise hopeless cripples to walk.

TYPES AND TYPING IN PNEUMONIA

By MAX A. GOLDZIEHER, M.D., BROOKLYN, N. Y.

THE common etiological factor in lobar pneumonia is the *Pneumococcus*. Microscopic examination and cultural methods do not help us much in distinguishing between the various types which are found to exist among pneumococci. Immunological methods had to be resorted to in order to establish differences between the various types of pneumococci. By means of the agglutination test, applied first by

Neufeld and later by Cole, Dochez and others, it could be shown that four large groups can be distinguished. Immune sera obtained against three of these groups are strongly specific and it seems that the pneumococci, which we classify as belonging to type I, II, III, represent well-established types of this microbe. Group IV, however, is so to say, a wastebasket for all the other much less common and much less definitely dif-

ferentiated pneumococci. Recent investigations have shown that it is possible to subdivide this group, IV, into at least 11 subdivisions.

For practical purposes, however, the division into four groups seems to be sufficient. The most common cause of lobar pneumonia is the type I and type II pneumococcus, which among themselves cause about 65% of all cases of pneumonia. Type III represents only 9%, while type IV occurs in about 20%. Types I and II are responsible for a rate of mortality from 25 to 30%, type III seems to be much more dangerous with a mortality over 45%. On the other hand, type IV, gives the lowest rate of mortality, estimated at about 12%.

In order to make serum therapy successful, it seems imperative to diagnose the type of causative agent at the earliest possible moment. Various methods have been applied for this purpose. Dochez and Avery have shown that the urine in cases of pneumonia contains a specific substance which can be precipitated by the corresponding immune serum, thus identifying the type of pneumococcus. However, this precipitin reaction is obtained only in about 65% and therefore has no real practical value. Demonstration of precipitin in the blood serum is a more promising method but requires further research. The most commonly practiced method for typing pneumo-

cocci is the mouse test. White mice are injected intraperitoneally with sputum containing pneumococci. The latter multiply quite rapidly in this susceptible animal, and as a rule within 24 hours, sufficiently large amounts of exudate have accumulated in the peritoneal cavity. This exudate contains large quantities of pneumococci, which are obtained by centrifugalization and their type is demonstrated by agglutination with the specific immune serum. The drawback of this method is the delay of some times as much as 24 hours. Much more rapid although not quite as satisfactory is Oliver's method in which the sputum or exudate is treated with bile which dissolves the pneumococci. A clear fluid, obtained by centrifugalization is used for the precipitation test with the immune serum. The most rapid and still perfectly reliable and, therefore, ideal method for typing is that of Rosenthal and Sternberg, as shown in our own laboratories. The sputum, or other material, which contains the pneumococci, is dissolved by means of a solution of borax. A clear fluid is obtained by centrifugalization and the precipitation is made on a glass slide under the microscope. The whole test requires only a few minutes and gives us the benefit of the opportunity for the practically immediate administration of the antipneumococcus serum.

SERUM THERAPY IN PNEUMONIA

By THOMAS A. McGOLDRICK, M.D., BROOKLYN, N. Y.

IT IS difficult to state definitely the mortality of lobar pneumonia. The time of the disease when treatment was first instituted, the age and habits of the individual affected, the presence of systemic diseases, the number of lobes involved, the changing virulence of the disease in different years, in different seasons of the year, yes, in different countries, all enter into that answer. Formerly patients cared for at their homes had a mortality rate about one quarter that of those treated in hospitals. A series of 1,107 cases treated (without serum) at Bellevue Hospital showed a death rate of 30.8%. In St. Peter's Hospital, Brooklyn, all lobar pneumonia cases admitted for 39 years, nearly 2,000 cases, gave a death rate of 27%. In Great Britain in 500,000 cases collected for the literature it was 20%. Scotch recorders placed it in their country at 21-22%. With types I, II, III of pneumococci, the rate differs from 20 to 44.3%.

While we have of value many remedial measures, these death rates have stressed the need and encouraged workers to find a specific for this disease. The pneumococci produce no endotoxin nor exotoxin and antitoxins are accordingly valueless. Antibacterial serum or sera must be obtained which acting through the blood stream

would there increase the antibodies. On the consolidated lung itself they too, have no effect. When one recalls that 28 different types of pneumococci have now been isolated the task of preparing a serum polyvalent for all is very great.

Undaunted, workers have sought to prepare serum for specific types and in types I and II have had a measure of success. In animals (monkeys) curability has been had in 100%. The earlier serum (Cole of Rockefeller) was applicable to type I cases and while helpful it was of low potency (titre), had to be used in large quantities at a dose (200 c.c. intravenously), frequently had reactions of much discomfort at least, and was restricted in usefulness to the very earliest time of the disease—first or second day. Six years ago Felton produced a serum for type I and II cases, and as modified by Bullowa is more concentrated. The usual amount of a dose is 15 c.c. and contains 20,000 units. In fact, it has been reported as concentrated to 50,000 units to 1 c.c. A unit being the amount of serum that will protect a mouse against a million fatal doses of P culture.

Concentrated in this way those distressing reactions, allergic thermal and serum sickness are less likely to occur, and if occurring are not

severe. It will be recalled that more than 55% of all cases are of types I and II.

Not waiting for typing, the patient is given immediately a dose of 5,000 units, followed in two hours if there be no untoward reaction by 20,000 units. Before the next dose is given the type of organism should have been learned. If of type I or II and the toxemia has not lessened and fever abated 20,000 more units are given every six hours for twenty-four or forty-eight hours. If crisis has not then occurred it may be continued in smaller doses. There has been reported a method by Sabin of great promise whereby on a glass slide the agglutinating power of the patient's serum to the causative type may be learned in a few minutes. It has been shown that the antibodies rise in number in fairly constant relationship to the agglutinating properties and by this information the dosage (of serum) may be better regulated and increased or discontinued earlier than when guided only by clinical findings.

It is hardly necessary to say that at administration the serum should be warm and injected very slowly, taking five minutes for the first c.c., and ten minutes more for the remaining 14 c.c.

By learning from the history of the patient if there have ever been any allergic reactions, by testing for sensitiveness on conjunctiva, intradermally or subcutaneously and the use of this serum so prepared and concentrated, the draw-

back of horse serum generally may be averted—drawback, let me add, which has caused one death in 70,000 cases.

The cost too, is frequently prohibitive. Some Departments of Health furnish it free under certain conditions, to certain hospitals. The usual retail price is \$18.00 for 20,000 units and for one day over 100,000 units may be needed. The serum as marketed is composed of equal number of units for type I and type II.

Notwithstanding the liability to err with statistics and especially with lobar pneumonia cases, definite and trustworthy results have been obtained. In several series reported by different observers the death rate was reduced in type I cases 33%, and even as much as 42%. In type II a reduction in death rate of 22%. More than 55% of all cases belong in these two classes. Besides accurate typing the method of control was to treat every alternate case admitted to the hospital suffering from pneumonia with serum. In no other respect did the care of serum treated patients and non-serum treated patients differ. Only patients moribund on admission were excluded from these series. Serum, I repeat, cannot prevent complications, cannot cure anoxaemia or cardiac failure nor existing systemic disease, but if increasing numbers of cases prove the promise now held forth, in New York City the reduction in number from 10,000 deaths annually from lobar pneumonia will be remarkable.

CARBOGEN THERAPY IN PNEUMONIA

By JOHN J. WITTMER, M.D., BROOKLYN, N. Y.

THE localized changes in pneumonia result in mechanical interference with circulation and respiration, and produce toxic reactions throughout the body. Combined with this there is organic embarrassment which primarily is induced by the consolidation and closure of a part, or all of the lobe, or lobes of the lung.

The actual aeration space is much decreased, not only because of the temporary incapacitation of the part actually involved, but also due to the partial atelectasis in the contiguous areas. This decreased area of ventilation causes increased cardiac strain, especially at a time when the patient demands an abnormal supply of oxygen, to take care of increased combustion during the disease.

The liver-like heavy material in the affected part also narrows the capillaries in the alveolar tissue and definitely impedes the circulation. This causes an additional strain on the heart, since the damming of the blood in the congested lung tissue does not allow a free flow from the right ventricle, which in turn does not allow complete evacuation of the right auricle.

We believe, with Drs. Henderson, Coryllos, Birnbaum and others that carbon dioxide and

oxygen inhalation not only relieves cardiac strain, by hyperventilating the remaining normal alveoli and overcoming the concomitant atelectasis, but the work of Dr. Charles S. Danzer suggests that CO₂ also stimulates peristaltic contractions of the small blood vessels with resulting increased circulation in the consolidated area.

It is apparent that the impedance of the circulation occurs in the involved area soon after the onset of the disease. Some physicians feel this condition need not be materially corrected until cyanosis, and usually marked cyanosis is manifest. Carbogen or oxygen is then used and the cyanosis is quickly dissipated. Inhalation is then too often stopped until cyanosis reappears. If inhalations of carbogen do relieve cardiac strain, and in our observations it definitely has, its use should not be postponed until actual embarrassment is present, or stopped, when the severe strain is over.

To compensate for the decreased lung area the patient must breathe faster and harder. This difficulty makes the individual uncomfortable, and, even more important, taxes the energy which we all know should be conserved. The use of carbogen, causing greater expansion of the

lungs, with increased lung capacity and the added supply of oxygen, relieves the anoxemia and minimizes the patient's efforts.

Pneumonia cases demand unusual attention during the entire course of the disease. When the carbogen treatment is instituted, it, in addition to routine pneumonia procedures should be watched constantly by the doctor and the nurse. The proper inhalational treatment is not merely to place a mask or tent over the patient and hope that he will be relieved of the extreme condition which exists. The flow of gas and the proportions of carbon dioxide and oxygen should be very carefully regulated according to the changes in pulse, and respiration which occur.

In administering carbogen inhalational treatment for pneumonia the best results may be obtained,

By using carbogen inhalational treatment as soon as pneumonia is suspected so as, if possible, to abort the fulminant inflammation.

By administering the inhalational treatment continuously, rather than spasmodically or symptomatically.

By continuing inhalational treatment until resolution sets in, and then, for periods of half an hour at hourly intervals until resolution is complete.

By administering the carbogen by the use of a tent rather than by face piece or mask.

The usual carbogen mixture is 7% CO₂ and

93% oxygen which actually provides the patient in most tents with 5% CO₂ and 45% oxygen. This proportion should be varied in accordance with the patient's condition. Tanks of 10% and 20% carbogen should be kept available for emergencies.

The temperature within the tent can be kept lower than the outside atmosphere. This can be accomplished by an injector at the top of the tent, drawing out the warm air in the tent, mixing it with fresh carbogen through a tube, and circulating it through a container which holds either water ice, or about a container of "dry ice."

The air thus mixed with new carbogen then flows back into the tent at the desired temperature. Wet ice will quite consistently keep the temperature 2 to 4 degrees lower than the outside atmosphere and with dry ice eight or ten degrees lower.

The relative humidity is maintained below fifty by the exposure of the air to the water ice or dry ice in the container.

Pneumonia to my mind must be treated the same as any other infection. The usual pneumonia procedures should be instituted, and in addition, carbon dioxide and oxygen will overcome the pathology in this localized lung area by overcoming atelectasis, promoting drainage, and aids the heart in bearing its terrific burden while the body is building up its corps of anti-bodies to neutralize the effects of the disease.

SUPPORTIVE TREATMENT IN PNEUMONIA

By HENRY M. MOSES, M.D., BROOKLYN, N. Y.

IN the supportive treatment of pneumonia, whether lobar, caused by the pneumococcus or the pneumococcus plus the tubercle bacillus, the typhoid bacillus, the streptococci, Pfeiffer's or Friedlander's bacillus, or broncho, caused by practically anything, we are using the most important factor in the care of the patient as an individual. Specific vaccines, or sera made to combat specific causes of pneumonia may be useful in lessening the severity of the attack or increasing the immunity of the patient, but we must recognize that immunity depends upon a number of different factors, the discussion of which is out of place at this time. While we acknowledge the benefits which may be derived from the use of sera in appropriate conditions, we recognize, also, that all forms of supportive treatment, needed by the individual patient, are used in addition to specific treatment. So long as the term "pneumonia" is an all-inclusive term for any inflammatory process in the lung, from many different causes, just so long will it be impossible to discover any serum or vaccine which will act as a specific to cure all forms of pneumonia. Some such media will no doubt be found,

in addition to our present known sera and vaccines, which will cure pulmonary inflammations from specific infections. Until the nomenclature of pneumonia has been improved, however, the supportive treatment is the treatment in pneumonia.

We know that the presence of any diseased condition, and the severity of any attack in an individual is determined by the following factors:

- (1) The number of the infecting organisms,
 - (2) The virulence of the infecting organisms,
 - (3) The immunity of the individual, whether natural or acquired.
- Treatment depends, also, upon these factors. Supportive treatment consists in stopping or diminishing the first two of these factors, and in increasing the third factor. Supportive treatment is modified according to the age of the patient, which is of prognostic importance in pneumonia. Notwithstanding excellent physical condition, the treatment must be influenced, also, by the toxemia and the extent of the lung involved. We recognize that pneumonia is a general disease, with its localized symptoms usually in the lungs. Consequently,

support of all systems must be considered in the supportive treatment. The patient's energies must be saved in every way. We must remember that we are dealing, especially in the lobar form, with a violent disease which in a few days usually terminates in recovery or death. During these few days, the resisting factors of the individual are strained to the utmost and he often becomes dehydrated, emaciated and otherwise greatly under normal. We must support the nutrition of the body by aiding the digestive system to function with the least effort, by supplying a nourishing, easily-digested, non-putrefactive, small residue diet, such as fruit juices, diluted milk, and cereal gruel, in patients between the ages of ten years and fifty years. A diet of this nature will support the patient during this short disease, will not form much residue in the intestinal tract, will not necessitate enemas, and will save the strength of the patient. Also, this diet will not add burden to the kidneys, which are our greatest aids in elimination. The younger and older patients may have a more liberal diet for support, if considered necessary. In bronchopneumonia, which is a longer condition than lobar, the diet may contain more calories. Give water and other fluids freely, in not too large quantities at a time. In considering physical rest for the patient, we must avoid all unnecessary movement by the patient, many of the physical demands by the patient can be lessened by the attention of a careful nurse. It is an important factor to arrange all medication, diet, and other attention to fall at the same time on a two- or three-hour schedule, and thus allow the patient to rest completely during the interval. To all patients with pneumonia, always give food and medication at regular intervals during the twenty-four hours. Be careful not to over-medicate. Judicious neglect, under constant observation, often accomplishes much for some patients.

The poisoning, or toxemia, in pneumonia acts not only on the heart, but also, on the respiratory and the excretory systems. With these systems below normal, their dysfunction must be aided by us, in addition to directing our efforts against the acute condition in the lungs. Frequently, dyspnea is out of all proportion to the amount of lung involved, and is due to the general poisoning, cyanosis is marked, and is due to anoxemia—the treatment of which is a mixture of oxygen and carbon-dioxide in an oxygen chamber or tent. The benefits of its use are:

- (1) The disappearance or diminution of cyanosis;
- (2) The slowing of the pulse, with improvement of the quality;
- (3) The slowing of the respiratory rate;
- (4) A decrease in the restlessness, or delirium, if present;
- (5) There is a subjective improvement in the

patient. This treatment, when once begun, should be continued throughout the course of the disease. The combination of oxygen and carbon-dioxide is certainly a valuable addition in treatment when its use is begun early, prescribed judiciously and continued throughout the attack, instead of being tried as a last-resort measure, when the patient is moribund.

Support of the heart is essential—the condition of the circulation is important. The object in supporting the heart by drugs is to prevent heart failure from over-exertion, caused:

(1) Mechanically, in trying to carry on the circulation through the solidified lung;

(2) By the poison of the disease;

(3) By myocardial failure, due to old valve lesions, or to an under-nourished, sclerotic myocardium.

Many careful observers consider that death attributed to heart failure is due, in many cases, to vasomotor paralysis instead of myocardial failure. It has been demonstrated that in a number of cases, uncomplicated by chronic disease of other organs, death occurs not directly as a cardiac failure, but as a result of paralysis of vasoconstrictor nerves resulting in a visceral dilation, with the blood remaining in the organs, and leaving the heart actually without blood to keep in circulation, in other words, we have medical shock. Vaso-motor paralysis is shown by:

(1) Low blood pressure;

(2) Profuse perspiration;

(3) The other symptoms of shock.

The treatment of this condition is by adrenalin; usually 5 c.c. is given every twenty minutes for six doses, then continued every two hours. Ephedrin is used also in this condition. The question of the use of digitalis, in small or massive doses, for cardiac support or stimulation, is still a debated one—it is not to be given in every case as a routine measure. In youth, with a normal heart, it is seldom necessary; after thirty-five years of age, it may be given if indicated. It is usually given throughout the disease in chronic valvular conditions, and in cardiac irregularities, especially in auricular fibrillation. Strychnine and camphor were much used formerly in pneumonia, but at the present time, the use of these drugs is not so general. Caffeine is considered a valuable heart stimulant. The use of whiskey is a debated question. To the writer it has seemed to be of benefit to those over sixty years of age, and serves to help the chronic alcoholics during an attack of pneumonia. The dose does not have to be large.

It seems hardly necessary to mention that in these rapidly changing physical conditions in pneumonia patients, close daily observation of the various organs such as the heart, pericardium, kidneys, veins and lungs, should be made so as to recognize quickly intercurrent changes and to treat these appropriately.

PROCTOLOGY IN THE HEALTH EXAMINATION

By MICHAEL CANICK, M D, BROOKLYN, N. Y.

NO one would fail in the course of a special or a general examination to investigate the condition of the mouth, nose and throat, since it has been established that they are potent foci of infection, and since their detection can be obtained without an elaborate expenditure of time and material. A similar if not a more potent source of infection in the body is the ano-rectum which, because of its accessibility and the ease and simplicity of its examination should be investigated in nearly every patient presenting himself for examination. Obviously, when the complaint is directly referable to the rectum such as pain, protrusion, bleeding or discharge of mucus, our attention will naturally be directed to that organ but it is a good policy to have it examined routinely in all constitutional derangements of the body and in complaints referable to adjacent organs such as the genito-urinary tract. The frequency with which one notices pain on urination caused by fissure in ano, or a persistent morning drop promptly clear on the removal of an infected crypt or after the cure of a proctitis is truly surprising. In an experience of many thousands of cases I have met with most any pathological condition which was directly or reflexly caused by pathology in the rectum such as asthma, eczema, arthritis, nervous disturbances, etc. But a rectal examination is imperative in the following conditions:

(1) Constipation, whether due to dietetic or habitual errors should never be treated without an investigation of the organs which fails in performing its duty, namely the rectum. Very frequently a spastic sphincter is the sole cause and often the passing of the procto-cope results in a cure by breaking the spasm.

(2) Gastro intestinal complaints. Most cases

of nausea, pyrosis, and dyspepsia are due to antiperistalsis occasioned by a spastic sphincter. Gall-bladder disease are frequently associated with fissure in ano. The patient will tell you that when the fissure is painful they are free from gall-bladder pains, while when the fissure heals over they become conscious of pain in the gall-bladder region, undoubtedly due to the fact that when the fissure heals over there is no more drainage of the infection from the base of the fissure and it is absorbed into the portal system.

(3) Cases of arthritis, rather peri-arthritis especially of the wrists and ankle are frequently associated with ulcers of the rectum or colon.

(4) Many obscure cases of melancholia have been cured after the removal of foci of infection from the ano-rectum.

As to examination, an ordinary table, good light, and a finger cot will be found to be all sufficient in the majority of cases, since over 75% of the pathology in that region is either near or just within the anus. Gentle retraction of the buttocks, while the patient, in left Sim's position, is bearing down, will disclose prolapsing and bleeding hemorrhoids, fissure, and fistula, while the right index finger passed through the anus will palpate any deviation from the normal velvety feel of the mucosa such as the internal opening of a fistula, infected crypts, enlarged anal papillae, polyp and cancer. One cannot emphasize too much the importance of distinguishing between external or skin covered hemorrhoids and internal or mucous membrane covered hemorrhoids for while the latter belong inside the cavity the former ought to stay out. Failure to distinguish this fact is responsible for external thrombotic hemorrhoids being forced into the anus, causing pain and strangulation.

THE HEALTH EXAMINATION FROM THE STANDPOINT OF THE CARDIOLOGIST

By WILLIAM E. McCOLLUM, M D, BROOKLYN, N. Y.

IN the consideration of the patient to determine whether or not heart disease is present, perhaps one's first thought should be to exercise as much care in not making a diagnosis of cardiac disease upon insufficient evidence as in finding it when it is present.

Cabot in the first pages of his book (*Facts on the Heart*) emphasizes the harm often done to the patient by a wrong diagnosis. Heart disease is sometimes believed to be present upon insufficient evidence, such as attacks of dizziness, fainting, or slight precordial pain, in the presence of

a harmless systolic murmur, or in patients with the effort syndrome complaining of dyspnea, cardiac pain and palpitation.

Cabot says "The fears, disappointments and ailments resulting from an unwarranted diagnosis of heart disease may make a person's life miserable, all of which may be swept away by a positive assurance based upon a careful examination."

The classification of the American Heart Association in approaching heart disease from the standpoints of etiology, anatomy, physiology and

functional capacity, is very useful in any consideration of the subject.

There is no organ in the body where etiological factors are of more importance. With the exception of thyroid heart, congenital lesions and those known to be due to bacterial infection, all heart disease generally falls into one of three types—rheumatic, syphilitic, and hypertensive or arteriosclerotic.

Before commencing the physical examination it is most desirable to attempt to determine the presence or absence of any of these three factors as valuable clues may often be obtained: for example, with a history of rheumatic fever, the presence of even a systolic murmur makes a most careful examination necessary.

Passing over findings in the general examination, such as an enlarged thyroid gland, edema, cyanosis, jaundice and abnormal pulsations in the peripheral vessels, it may be stated that the estimation of the blood pressure may direct attention to hypertensive heart disease or to aortic regurgitation when a high pulse pressure is found, or to auricular fibrillation when particular difficulty is encountered in estimating the pressure.

In the examination of the heart itself the usual sequence is best. On inspection localization of the apex beat, when this is possible, is of the greatest help. An enlarged heart is almost always a diseased heart. Palpation may enable one to localize the apex beat when not possible by inspection. The presence of a systolic thrill in the aortic area is a sign of value in the diagnosis of aortic stenosis, and a presystolic thrill in the mitral region, felt before a strong apical thrust, usually means mitral stenosis. A diffuse and unusually forcible apex beat is often a sign of disease.

Percussion of the heart borders, especially the right, is a difficult procedure, and probably most examiners will get more information from a localization of the apex beat.

Auscultation should be performed with the patient sitting, lying on the back, and on the left side. Disturbances of rate and rhythm are better determined by auscultation than by any other method except the electrocardiographic. The most common arrhythmias are the physiological sinus arrhythmia, premature contractions, which usually are not signs of organic disease, and auricular fibrillation which is most commonly found in mitral or in hypertensive or arteriosclerotic heart disease.

Sinus irregularities occur principally in children and are usually related to respiration, the pulse rate quickening with inspiration and slowing with expiration. When this relationship is evident, the diagnosis is clear. A gradual waxing and waning of rate is important. All sinus irregularities are due to alterations in vagus tone and are abolished by anything as exercise, fever,

or atropine, which increases the pulse rate. Premature beats usually disappear or diminish in frequency upon increasing the rate of the heart by exercise, and the absolute arrhythmia of auricular fibrillation increases on exercise. In auricular fibrillation the unequal force of the beats is best appreciated when taking the blood pressure. When the irregularity is very marked, a true blood pressure estimation cannot be made. In exceptional instances an electrocardiogram may be necessary to distinguish between premature contractions and auricular fibrillation.

The character and relative intensity of the first and second heart sounds at apex and base should be noted. In young people the second sound is generally loudest in the second left interspace near the sternum. In middle age it is about of equal intensity to right and left of the sternum. In old age it is usually loudest to the right. A snapping accentuated first sound at the apex should make one think of mitral stenosis, although it may occur physiologically with exercise or excitement. An accentuated aortic second sound suggests hypertension and an accentuated pulmonic second sound mitral disease or some condition increasing the work of the right ventricle, as emphysema.

As causes of decrease in the intensity of the heart sounds may be mentioned increased musculature of the chest wall, obesity, pleural or pericardial effusions, circulatory failure due to collapse with peripheral dilatation, and failure of the heart from intra-cardiac causes.

When a murmur is heard, its time in the cardiac cycle should be determined by placing one finger on the apex beat or carotid artery. The radial pulse follows the apex beat at enough of an interval to confuse the time. It has been repeatedly emphasized that a systolic murmur does not necessarily indicate cardiac disease. The presence of an etiological factor and of enlargement of the heart is here of importance. It is sometimes very difficult to decide whether a systolic murmur is organic or functional. Diastolic murmurs are less common than systolic, more significant and often more difficult to hear. The murmur most often overlooked is that of mitral stenosis. This is low-pitched and usually best heard at the apex or over a small area toward the sternum from the apex with the patient lying down. Sometimes it is best heard with the patient lying on the left side. It may be very faint and occurs late in diastole.

The murmur of aortic regurgitation is generally best heard with the patient sitting up and leaning forward. It is blowing in quality, often very gentle, and usually best heard over the mid-sternum or to the left of it, less commonly to the right.

Degenerative lesions of the myocardium probably offer the most difficulty in diagnosis as they

may occur, as is well known, with slight or no changes in the heart sounds. Here the electrocardiogram may be indispensable for accurate diagnosis. Conduction disturbances, T wave changes, or changes in the Q R S complexes may indicate the pathology present.

If the history and physical examination are not completely satisfactory in any case where heart disease is believed to be present, the routine employment of the Wassermann test, x-ray with two meter plate, or orthodiagram and electrocardiogram is desirable.

UROLOGY IN THE HEALTH EXAMINATION

By N. P. RATHBUN, M.D., BROOKLYN, N. Y.

ACAREFUL history is of paramount importance and should, in addition to an inquiry into any previous diseases or present distress referred to any portion of the urinary tract, include also a careful inquiry into any variations from normal in the act of urination or character of the urine as noticed by patients themselves, such as undue frequency, pain, difficulty in starting, feeble stream, persistently cloudy urine, foul smelling urine or blood in the urine.

Frequency of urination, worse at night, in a young adult suggests renal tuberculosis, the same symptom in an elderly man suggests prostatism. Pain suggests a lesion at or about the bladder neck with perhaps a background higher up. Difficulty in starting and feeble stream suggests urethral stricture in a young male and prostatism in an older man. Persistently cloudy and foul smelling urine means infection above the bladder neck. A history of bloody urine is of tremendous importance. It means tumor in exactly half of the cases and demands a prompt investi-

gation to determine its origin and nature, even if the urine is normal at the time of the examination.

In addition to the routine laboratory examination of the 24-hour specimen, one should require their male patients to void their urine in two glasses as a part of the examination. A cloudy second glass, excluding phosphates, means infection in the upper urinary tract. If the laboratory reports pus in the urine of a female patient, it should be checked by examining a catheterized specimen to exclude contamination.

No physical examination is complete in the male patient which does not include a rectal examination. Prostatic carcinoma in its early stages when it is readily amenable to radical surgery often gives no symptoms.

Any leads suggested by the history or physical findings as previously outlined should be followed through to an accurate diagnosis in some cases involving the employment of more complicated technical procedure such as x-ray and cystoscopy.

HEALTH EXAMINATION FROM THE STANDPOINT OF GASTROENTEROLOGY

By ALBERT F. R. ANDRESEN, M.D., BROOKLYN, N. Y.

REALIZING the importance of a careful history in the diagnosis of gastrointestinal diseases, it must be emphasized that some questioning in regard to gastrointestinal symptoms must be a part of a health examination. The common gastrointestinal symptoms of belching, regurgitation, dysphagia, heartburn, nausea, vomiting, constipation, diarrhea and chest or abdominal pain, call for a more complete investigation than is done in an ordinary health examination—they require gastric and duodenal analyses, studies of the feces, x-ray, proctoscopic and at times esophagoscopic studies. In a person of middle age, such symptoms, especially if of recent origin, should occasion a suspicion of an early malignancy. In order to recognize malignancy at its earliest stages it has been suggested that a complete gastrointestinal x-ray study should be a part of every health examina-

tion, but the necessarily high cost of such an examination restricts it in most cases to those having at least some gastrointestinal symptoms.

Actual physical examination of the gastrointestinal tract is only possible at its upper and lower extremities. Considering the mouth as the upper end of the tract, it is essential that the examiner realize the importance and potential danger from the focal infection standpoint of gum edge and apical infections, of devital or even carious teeth, of infected tonsils, and of post-nasal drip, as indicating possible serious nasopharyngeal infections. A careful search for cancerous or precancerous lesions is of course important. In the presence of painful or difficult swallowing or of regurgitation of foods, with some delay in the passage of the small stomach tube, esophageal x-ray study and esophagoscopy are indicated.

Although the proctologist will point out its importance, I believe it cannot be too strongly emphasized that at least a rectal digital examination should constitute a part of every health examination, and it would be well if the use of the anoscope and procto-sigmoidoscope were more generally resorted to.

Abdominal examination may show such re-

lievable findings as lax abdominal wall, postural deformities or hernias, may show the presence of ascites or dilated superficial veins indicating cardiac decompensation or portal obstruction, may determine enlargement of some abdominal organs, or may disclose tenderness, rigidity or tumors which call for an intensive gastrointestinal study or operative interference.

OPHTHALMOLOGY IN THE HEALTH EXAMINATION

By JOHN N. EVANS, M.D., BROOKLYN, N. Y.

MODERN ophthalmology, through its rapid progress, is able to offer you much more than the conventional eyeground studies as an aid in the health examination. It supplies data on functional as well as organic changes.

We are so apt to think of *eyeglasses* as related only to visual efficiency, yet we must realize that variations of the index of refraction and changes in muscle tone are often the earliest manifestations of diabetes, lues, acute infections and other disorders.

You are all familiar with the paramount value of *visual field* studies in the demonstration and localization of cerebral lesions but we must not forget that this means may also detect, measure and record the effect on the end organ of various toxins and circulatory disturbances.

Besides these methods, a vast armamentarium of functional tests and improved methods have enabled us to draw data for your use. Ex-

amination with the *corneal microscope* permits us to see the individual red and white cells, single nerve fibers and the earliest pathological changes.

Eyeground studies have become more refined. We now use various *color filters* to make more prominent minute details. We measure *blood pressure* within the retinal arterioles and we may make a permanent record of changes with the *fundus camera*. *Colorimetric measurements* of optic nerve are possible, and the *campimeter* records minute derangements of function and structure of the retinal and choroidal elements.

It thus becomes apparent that the ophthalmological examination should supply you with information comparing very favorably with the finest type of laboratory data. Its findings are recordable for comparison at later dates and it will continue to supply material evidence for the health examination.

GENERAL MEDICINE IN A HEALTH EXAMINATION

By S. R. BLATTEIS, M.D., BROOKLYN, N. Y.

PART of a discussion on a symposium of Health Examinations held at a meeting of the Second District Branch of the New York State Medical Society, at the Hotel St. George, November 19, 1931.

The campaign for Periodic Health Examinations has been carried on intensively enough to have acquainted the members of the medical profession with the technical details of the *modus operandi*.

There is one feature of these examinations about which little has been said and yet which must confront every examiner; that feature is "How much shall the patient be told." It is because of the diversity of opinion expressed by men of large experience at a meeting of the first committee appointed by the Kings County Medical Society on Health Examinations that one feels justified in expressing definite opinion even

though it may vary widely from opinions held by others.

I should adopt as an axiom the general proposition: The patient should be told as little as possible.

As a rule those who present themselves for health examination consider themselves in average good health. They come with the expectation to receive a clean bill of health. It certainly is not obligatory on the part of the doctor to guarantee this; and yet the examiner must appreciate the difference in the psychological attitude between the sick patient expecting some verdict from the doctor and the apparently healthy individual who prides himself that he is wise enough to follow advice which will keep him well for a long time.

In the one a certain disappointment is experienced if no definite findings of illness are an-

nounced, while in the other it would come as a shock. Certainly if some one should appear for a health examination who is found to be suffering from an acute or uncompensated chronic heart failure, or one showing a severe nephritis, or another with marked vascular disease, another with cerebral symptoms having a four plus Wassermann, these of course would have to be told, but these are not the individuals who appear for a health examination. They come who, unconscious of any defect anywhere in their system are found to have, let us suppose impurity of a heart sound at one or the other orifices. Even if it be assumed that it is the result of some organic change in the valves but which is found to be perfectly compensated and has stood the test of all the requirements of the individual through many years, it is my opinion that this individual should not be told he has an organic heart disease and be required to change his routine of living. This information, told the patient bluntly, as it often is, produces in him or her an effect which no amount of assurance as to its mildness and unimportance can dispel. A cardiophobia rapidly develops and with it a mental and physical breakdown.

Surely every physician possesses enough ingenuity to meet such a situation tactfully and sympathetically. The argument put forward that if you don't tell, some other doctor will can be met, if deemed necessary, by giving the information to some responsible member of the family

Another common question confronting the examiner is the one of "Blood Pressure." What shall the answer be to the question so often put to us, "Doctor what is my blood pressure?" My attitude is not to tell the figures, I contend that is information for the doctor. I tell the individual that as a rule the figures by themselves have little significance and can be interpreted correctly only by a doctor, and that in some instances high figures are necessary to keep the system at its best, at other times the reverse is true. Some amplification of this idea usually proves satisfactory.

Many doctors take pleasure in telling a patient that the lungs are all right, that while one or the other of the apices shows a perfectly healed lesion, there is no suspicion of any trouble in the lungs now. The reaction to this statement is in the main a bad one. The patient interprets it that he at one time had the disease (Tuberculosis) but that by some chance of fortune recovered, but he isn't sure that it won't return, he feels himself susceptible to the disease; and no amount of assurance can remove this impression.

The patient should not be told he has a healed lesion. If he has a suspicious active lesion no matter how small, that cannot be disregarded.

Many similar analogous instances can be cited and while no hard and fast rule can be laid down to serve on all occasions time will vindicate the practice that the patient shall be told as little as possible.

OBSERVATIONS ON THE DIAGNOSIS OF EARLY SYPHILIS

By ALBERT PFEIFFER, M.D., ALBANY, N. Y.

Director, Division of Social Hygiene New York State Department of Health

WHILE syphilis is still commonly classified as a matter of convenience into primary, secondary and tertiary stages, a more correct designation from a pathologic, morphologic and therapeutic standpoint, which is our main concern, is 1, early, and 2 late syphilis. For prognosis, the main factor is whether the patient is in the sero negative or sero positive stage.

The early lesion of syphilis is seen today can no longer be accurately described in the classical manner as it was in the distant past by the renowned John Hunter. It does not visibly portray a uniform picture and such characteristics as Hunter expounded regarding its appearance and feel, and for these reasons apparently many chancres have been unrecognized.

A small macule or papule which later ulcerates often goes unnoticed, without arousing suspicion except to the vigilant patient or the

observant diagnostician, because of its painless nature, and its disappearance in many cases within a few weeks with little if any scarring. Laboratory tests in both primary and secondary syphilis are essential to check the clinical diagnosis.

Additional reasons for not making an early diagnosis are the location of the primary lesion within the urethra, on the labia or cervix, and its appearance sometimes in multiple form. Any non-healing sore wherever located should arouse suspicion. The possibility of an intra-urethral chancre should be borne in mind in any patient with a urethral discharge. One's suspicion should always be aroused in patients presenting a scanty but persistent discharge, and possibly having a negative smear. The intraurethral chancre can often be palpated and the enlarged lymphatics and inguinal lymph nodes seen and felt as hard and shotty. Fournier's slogan "Suspect syphilis" and Ric-

ord's startling remark "Cherchez la bubo" are commonly ignored.

The chances for cure in the sero-negative stage are enormously better than after the blood shows a positive Wassermann reaction when the disease has advanced from one to four weeks, sometimes five or more, since the appearance of the lesion. Many physicians depend entirely upon the Wassermann report for their diagnosis of syphilis and are content and satisfied with but one blood examination which often is made too early for the reaction to be positive. This happens particularly when blood specimens are taken as a routine

our recent survey in which it was ascertained that only 42.1 per cent of the patients came for treatment within the first 12 months of having the disease, while 63 per cent of the women were not diagnosed within the first year. Men, of course, seek treatment earlier; they are conscious of the possibility of something being wrong, due to visible signs. We have found in our survey of upstate New York that gonococcal cases seek treatment much earlier than syphilitic cases; as high as 72 per cent of the males and 62 per cent of the females applied for treatment within the first three months of the gonococcal infection, and many of these would undoubtedly also have had syphilis.

While the laboratories throughout the state that are approved for dark-field examinations are strategically located and offer a fairly complete service for the state in general, there are many sections where it would not be particularly convenient to have immediate examinations made.

Again many patients through a desire for privacy would much prefer to have their own physicians make the examination rather than to go to a technician and a stranger.

The following cities have approved laboratories for dark field examinations: Albany, Auburn, Batavia, Bath, Belmont, Binghamton, Buffalo, Canandaigua, Clifton Springs, Cooperstown, Corning, Cortland, Dobbs Ferry, Geneva, Glens Falls, Gloversville, Hornell, Hudson, Kingston, Ithaca, Jamaica, Mount Vernon, Newburgh, New Rochelle, Niagara Falls, Olean, Oneida, Oneonta, Ossining, Penn Yan, Plattsburgh, Pomona, Poughkeepsie, Ray Brook, Rochester, Saranac Lake, Saratoga Springs, Schenectady, Syracuse, Tarrytown, Troy, Trudeau, Tuxedo Park, Utica, Valhalla, White Plains, Yonkers.

As an aid primarily to the general practitioner in rural sections, an outfit for the dark-field examination consisting of three capillary tubes and a small vial of sealing resin has been designed by the State Health Department. It has been found that spirochaetes will live in the capillary tubes for several days, and the use of the outfit has become a practical and established diagnostic measure by the Department. The outfits can be obtained at local supply stations or from the Department in Albany.

Explicit directions for collecting the serum from suspected lesions are supplied with the outfits, but a few high points might be mentioned.

1. Wear gloves for self-protection.
2. Apply a preliminary compress of novocaine to the lesion.
3. Obtain serum from the deeper tissues.

PHOTOGRAPHS

Patient, age 39, primary lesion, maculo-papular rash just appearing and enlarged bilateral inguinal glands. Primary lesion self-treated with many applications. Picture shows capillary tube being held in an approximately horizontal direction to facilitate the passing of the serum into the tube.

on all patients with a urethral discharge. Blood tests should be repeated at weekly intervals for several consecutive visits until the possibility of syphilis has been eliminated.

The actual and moral responsibility of effecting a cure and preventing infection of others rests to a great extent with the physician who first sees the patient. The main factor in the attack on syphilis is to establish the earliest possible diagnosis and institute immediate effective sterilizing treatment.

Our studies show that about 60 per cent of patients with syphilis are under the care of private practitioners, and probably a larger per cent are first seen by a private physician and given one or more treatments before they become clinic patients. That additional vigilance should be adopted is strikingly shown by

Spirochaetes are most abundant at the periphery close to the margins and slightly beyond, therefore considerable rubbing with gauze is necessary

4 Press the lesion between the fingers to stop bleeding and force the serum from the deeper tissues

5 Stroke with a capillary tube held preferably in the horizontal direction as shown in the photograph

6 Obtain one-half to one inch of fluid if possible, and gently shake the serum toward middle of the tube Apply the vial of resin against each end to seal the capillary tube effectively before placing it in the miling tube

In many instances various ointments and other applications have been applied by the patient, and then it becomes necessary to use a preliminary normal saline dressing for 12 to 24 hours before taking the specimen The additional tube furnished with the outfit are for a second specimen and for gland puncture When the lesion has been extensively self-treated, the spirochaetes might be obtained from a neighboring lymph gland In those cases where there is a superimposed pyogenic infection, a balanitis, or possibly phagedena, it might not be possible to get at the hidden chancre previous to a dorsal slit or circumcision, and the lymph gland offers the best site for obtaining the suspected serum

THE SIMPLIFICATION OF NASAL PLASTIC SURGERY*

By C R STRAATSMAN, MD, NEW YORK, N Y.

PERHAPS I might better have entitled my paper "The Standardization of Nasal Plastic Surgery" because I want to submit to you certain procedures which I feel must be followed to successfully carry out reparative work on the nose It has been our specific aim during the last few years to work out certain principles based on extensive practice and observation in handling nasal deformities All new developments in medicine and surgery begin with complicated methods and as experience is gained the technique tends to simplify itself This is especially true in nasal plastic surgery If one should compare the armamentarium of a nasal plastic case of a few years ago with that of today, he would find a considerable reduction in the number and kind of instruments used because the procedures are now more certain and the results obtained more uniform

I will now take up in a general way each type of nasal deformity and give you what I consider the best method for its repair Although every nasal deformity is a problem of its own, I feel that certain working procedures have been formulated for each type The most usual type of nasal deformity is the saddle nose, of which there are the mild and severe types We find that the small saddle is usually due to a distortion of the nasal elements, with little or no loss of tissues, and this type can be nicely repaired by the rearrangement of the nasal tissues, a procedure worked out in the clinic of Dr Sheehan—while the severe type is always due to a loss of substance which must be replaced by a transplant larger than can be obtained by the utilization of the upper two thirds of the lower lateral cartilages

The following substances are used to build up

the nose Cartilage, bone, ivory, celluloid and paraffin Of these the rib cartilage is the best because it is easily obtainable, easily shaped, and remains "as is" in its host Always remove all perichondrium

Bone transplants are most valuable when the loss confines itself to the bony bridge, as it is a known fact that if a bone graft is to live it must be so placed that there are bony attachments at each end of the transplant Therefore, in large saddle defects where there is a loss of the cartilaginous septum as well as of the bony process, the lower end of the graft, having no bony attachment, usually becomes fibrotic, which procedure tends to produce a sagging of the nasal tip due to lack of support This, however, never happens with a properly prepared rib cartilage

Ivory has its merit only as a temporary framework in infected cases, or in intermediate stages of a total rhinoplasty I feel justified in making this dogmatic statement because I have seen several instances where nature has treated it as a foreign body and has cast it off, leaving more severe destruction of the nose than was present before its insertion

Celluloid has been used but discarded for the same reasons as ivory, with the added hazard that the tissues are even less tolerant to celluloid than to ivory

Paraffin is mentioned only to condemn it, since we have all seen the condition known as paraffinoma, due to the ravages of injected paraffin with its resulting slough

Let us now consider the covering of the nasal framework, for due to its peculiar quality and firm attachment, it is almost impossible to repair losses of the skin or soft tissues by undermining and stretching—a method so successfully used elsewhere in the body When attempts have been

* Read before the Nassau County Medical Society Wednesday November 4 1931

made to forcibly lengthen the columella by the insertion of an oversized transplant—thus putting the skin of the tip under too great a tension—it has resulted in either a twisting of the transplant or a sloughing of the soft tissues covering it. Therefore before attempting to elevate the nasal tip the surgeon must determine the length of the finished columella so that he can take whatever tissue he needs from the lip at the time he makes his initial incision.

Tip losses are best repaired by attached grafts because of the difficulty in maintaining firm, even pressure in this region. Of the attached grafts, the tube-pedicle graft has proven most satisfactory, and for minor losses one taken from the arm is easily manipulated and there is no resulting forehead mutilation.† For complete loss of the nose the method of Blair—consisting of the forehead flap—is the best.

In cases of luetic disfigurement where there is a loss of the nasal lining, may I state that at present I am working on a method of using a tube flap from the arm to reline the nose, and, if necessary, this same flap can be utilized to repair any other losses which so often appear concurrently with destruction of the lining. A detailed report of this method will be given at a later date after more data have been obtained. Specific destruction of the framework of the nose without loss of the soft tissues is handled in the same manner as severe saddle deformities.

Another phase of this work deals with the oversized nose, and our problem here is a simpler one because it is easier to remove than to replace. Nasal enlargements group themselves into bone, cartilaginous, or tip hypertrophies. These may occur singly or in combination. In dealing with bony humps of any size, it is generally best to narrow the nasal process, otherwise the nose is apt to be too broad from the front view which offsets the improvement gained in the profile. In the removal of excess cartilage, it is best to slightly overcorrect because cartilage has a tendency to spring back—thus impairing the end result. In reducing the hypertrophied tip, it is best to excise sufficient soft tissue and cartilage so that the elements assume their new shape without the use of force.

Furthermore, it is always advisable to build the nose to fit the face and to conform with the patient's wishes whenever possible.

In conclusion, gentlemen, may I say that careful manipulation of tissues, accurate bandaging, and meticulous after-care all play an equally important part in the production of a satisfactory result.

† Plastic Repair of Partial Losses of the Nasal Tip, C. R. Straatsma, *Annals of Surgery*, May, 1930

The following are three typical examples of nasal deformities, and at the same time give you a brief idea of the method of procedure in each case.

FIG. 1 FIG. 2
CASE I

FIG. 1 FIG. 2
CASE II

FIG. 1 FIG. 2
CASE III

CASE I—FIGURE 1

Presents a typical nasal deformity following a septal abscess which was caused by an injury. As can be seen there is very little loss of the nasal elements so that repair could be accomplished by the rearrangement of the tissues. In doing this an intra-alar incision was made through the skin and cartilage about $\frac{1}{4}$ inch posteriorly to the anterior edge of the nostril, beginning at the junction of the septum and the inner border of the ala and extending laterally to the junction of the middle and lower thirds of the ala. The incision was not carried down further because in so doing the alar branch of the facial artery is generally cut and annoying bleeding results. The upper $\frac{2}{3}$ of the lower lateral cartilage was then removed and saved along with its fellow from the opposite side which was removed in exactly the same manner as the first one. The soft tissues were then undermined and the nasal bony ridge narrowed and the cartilages placed in the depressed area, giving the result seen in Case I, Fig. 2.

CASE II—FIGURE 1

This is a typical specific saddle nose which was produced by destruction of the framework of the nose without destruction of the nasal lining except in one small area which can be detected by the small depression over the remainder of the right nasal process. In this case a supporting framework had to be supplied by a rib cartilage. A columellar incision was made, the soft tissues of the nose undermined and a cartilaginous ridge and buttress support were inserted, giving the result seen in Case II, Figure 2.

CASE III—FIGURE 1

Shows a typical hypertrophied nose which was repaired by the removal of the excess bone and cartilage, giving the result shown in Case III, Figure 2.

THE SUMMER MEDICAL JOURNALS

Whatever may be the date of the beginning of the official year of a State Medical Society, the summer season is a time of comparative quiet in society activities, because of the vacations of the officers and committees. But the few weeks just before the summer are usually times of in-

tense activity, because of the annual meetings, and the summer time affords the opportunity to bring the reports of Society activities up to date. The summer journals are thus as important as those of other seasons. Medical editorship is in evidence in the summer as in the winter.

DR. JOHN A. CARD

Dr. John A. Card, Speaker of the House of Delegates of the Medical Society of the State of New York for four years, died in

Photograph by Dr. O. S. Wightman

DR. JOHN A. CARD, 1877-1932

his home city of Poughkeepsie on June 28, 1932, after a brief illness. Dr. Card brought to his high office a rare combination of technical ability and friendly humanity. Quick and accurate in his decisions, terse and acute in his announcements, he was always fair and considerate of the feelings of others, both supporters and opponents. His acts were dominated by a dual motive of truth, cold and mechanical, tempered with friendliness, warm and personal.

Dr. Card's dual temperament found a perfect outlet in two complementary lines of professional action. His friendly characteristics were expressed in the practice of his chosen specialty of pediatrics, while his irresistible trend toward truth and justice was revealed in his deep interest in criminology and psychiatry. It is probable that Dr. Card himself could not have stated which branch of practice he preferred. Each afforded the opportunity for the exercise of a dominant trait without the danger of a mental conflict.

The charm of Dr. Card's personality expressed itself in the way he took his part in the State Medical Society. Easy of approach, anxious at all times to be of assistance, he always had time to explain to a fellow physician the value of insurance, or patiently help him solve his problem.

He had that rare quality of inspiring confidence which children as well as physicians are the first to discover. Only an intelligent life, properly guided by experience, can bring to anyone this treasured combination.

Much might be said of his lending a helping hand to those in need, always in a most unobtrusive way. Dr. Card loved to live, and was most generous in sharing his life with others.

HEALTH PUBLICITY IN KANSAS

Most State Medical Societies are giving serious consideration to the problem of informing the people in regard to the preservation of their health. The problem has two distinctive phases:

1. Private instruction by individual doctors.
2. Public instruction by medical societies, nursing associations, and other health organizations.

Physicians in private practice constitute the largest and most efficient group of instructors of the people in health subjects. Their work is efficient because the persons whom they instruct

are in a receptive mood to carry out the advice. But at any given time physicians reach only that minority of the people who happen to be sick; and the subjects of their instruction are those applying only to that particular form of sickness which they may be treating. Yet the total amount of effective instruction imparted by family doctors is greater than that of all other groups. Physicians in general practice will continue to be the most important group of health teachers in a community.

Many States have organized systems of teaching pupils and students in schools and colleges with special emphasis on the individual in correcting physical defects and training the body in strength and grace.

The schools also give class-room instruction along all lines of health. The principal difficulty is that of the multitude of subjects which must be taught in order to touch upon the more common conditions which affect one's health.

Physicians realize the importance of applying the principles of school health instruction to the people generally. They take cooperative action through their County and State Medical Societies, and plan to give instruction on general health topics. The three principal means of instruction are the daily newspaper, the radio and the moving picture. The popularity and effectiveness of the hygienic instruction by these means are indicated by the fact that the owners of the distributing agencies find it profitable to use the instructive articles and pictures.

The leaders of the Medical Society of the State of Kansas felt that the continuance of the demand for health instruction was sure enough to justify their publication of a monthly journal of popular health. They had the precedent of the American Medical Association in publishing its popular health journal, *Hygienic*, which is now in its tenth year. With prompt courage the Kansas leaders prepared and issued the first number of

their own State publication, *Folks* in August, 1931. The birth of *Folks* was told in several articles in the Journal of the Kansas Medical Society which were abstracted in the New York STATE JOURNAL of April 15, 1931, page 504, and November 1, page 1366.

The July, 1932, issue of *Folks* completes Volume I, and affords an opportunity to judge its value. Its popularity in Kansas is indicated by the fact that its monthly circulation is 6,900 and is constantly increasing.

Each issue of the new magazine consists of sixteen pages slightly larger than those of the New York STATE JOURNAL. Only two pages of advertisements are carried. The articles are short, each less than five hundred words, and an average of twelve leading articles are contained in each issue. Nearly all the articles are written by Kansas physicians. Explanations of common medical conditions predominate. The Journal reflects the prevailing thought and attitude of the practicing physicians, and is well suited to enhance the respect of the public for the medical profession.

Folks is successful from a medical point of view, and any physician interested in popular medical publicity will do well to send fifty cents, the price of a year's subscription, to the Kansas Medical Society, 700 Kansas Avenue, Topeka, Kansas.

LOOKING BACKWARD

This Journal Twenty-five Years Ago

Hypodermic Syringes This Journal of July, 1907, contains an article by Dr. Martin B. Tinker, of Ithaca, on "Local Anesthesia" which illustrates the great progress made in hypodermic syringes in a quarter of a century. Dr. Tinker describes the syringes available in 1907.

"Among the materials to be used should be mentioned a syringe that can be readily boiled. Leather packed syringes are unsatisfactory because the packing shrivels when a high degree of heat is applied. The asbestos or rubber packed syringes I have found most satisfactory. A special form of hypodermic syringe supplied by Sharp & Dohme, of Baltimore, is one of the best, and for more massive infiltration I have found a 5 cc. rubber packed syringe, which is manufactured by the Randall Faichney Company, of Boston, perfectly satisfactory. There should be no leakage about the washer or packing, and in order that we may see that there is no leakage back of the piston, a glass barrel is essential. Some of

the solid metal syringes are very satisfactory at first, but with wear I have found that most of them leak when pressure is used for infiltration, the leakage cannot be seen, and of course fluid that leaks out around the piston is of no effect in relieving pain. The solid glass syringes are seldom strong enough to stand the pressure of infiltration. A sharp needle is more comfortable for the patient not only at the first prick but throughout the infiltration, and the location of the point can be much more certainly controlled. At present I always freeze an area the size of a dime with ethyl chloride at the location where I wish to begin infiltration. This prevents even the slight pain of the first prick of the needle; the succeeding pricks are painless because the needle is inserted in infiltrated areas and the fluid is injected ahead of the needle as it is pushed along the line of incision. A sharp jab from a hypodermic needle is not a good beginning for a major operation with a nervous patient."

MEDICAL PROGRESS

Vaccinia and the Paschen Body.—G. Hardy Eagles and J. C. G. Ledingham describe infection experiments with centrifugalized virus filtrates which afford evidence in support of the claim put forward by Paschen, as long ago as 1906, that the elementary bodies discovered by him in material from vaccinal lesions might prove to be the actual etiological agents. The experiments are substantially amplifications of those reported by Ward (1929) and Tang (1930) who followed up their successful filtrations of vaccinia virus through low-grade candle filters by centrifuging the filtrates and demonstrating a concentration of virus in the bottom layers. The authors have carried out their work with Berkefeld "V" filtrates of vaccinia virus which have been submitted to centrifugalization with a new model high speed centrifuge capable of speeds up to 14,000 revolutions per minute with a 10 c.c. load. A speed of 10,000 to 11,000 revolutions per minute acting for one hour has been found to result in a concentration of the virus in the lower layer of the fluid or in a deposit which is so lightly attached to the glass that the supernatant fluid cannot be removed without disturbing the deposit. If a small quantity of gelatin is placed in the tip of pointed tubes before the virus filtrate is added the elementary bodies can be held. Experiments in which the deposits were subjected to repeated washings in saline solution are particularly convincing, inasmuch as the stained preparations of the potent fluids showed rich carpets of the elementary bodies and an almost complete absence of other stainable material, formed or amorphous. As the saline menstruum itself contained almost no virus the conclusion is irresistible that the infecting agent is the Paschen body. In this connection it is interesting that Bedson (1932) has been able, by very similar means to those employed in this work, to obtain evidence that the minute bodies found in psittacosis represent in all probability the actual infective agents in this disease. It remains to be shown that artificial cultures starting from pure seedings of Paschen bodies are possible.—*The Lancet*, April 16, 1932, ccxxii, 5668.

General Pneumococcal Infection in the Negro.—According to G. Bouffard, frank pneumonia localized in the pulmonary tree is exceptional in the Negro, the pneumococcus in the great majority of individuals of this race being localized in important organs such as the liver and brain, with manifestations of a veritable septicemia. This is true not only of Negroes migrating to Europe, but also of those in sub-

tropical regions, where lobar pneumonia without pneumococcemia continues to be an exception. In such cases bacteriological examination reveals only a meningeal or hepatic pneumococcosis, whose etiology must be sought in the exposure to cold which lets loose the first cases in an epidemic. The pneumococcus, either because it develops in fatigued persons with little urge to work, or because it finds in the Negro a particularly favorable soil, becomes very virulent, acquires a great power to infect and promptly shows itself contagious. Septicemia is the rule; the bloom swarms with parasites and the blood culture is positive in nearly all cases during an epidemic. The affection is attended by a high mortality, reaching 25 to 70 per cent, despite the most active therapeutic measures, including serotherapy, intravenous injections of sodium salicylate and camphor in large doses. These cases occur as the result of the lessened resistance produced by the sudden transplantation of a race used to a tropical temperature into temperate zones. Prophylaxis consists in avoidance of chills, fatigue, and overwork. Work should be so adjusted as to prevent fatigue. But it is difficult to avoid imprudence on the part of natives who, accustomed to living in a nude state, do not know how to adjust their clothing to their needs. It may sometimes happen that groups of workmen in a community are infected by the arrival of recruits who are carriers of virulent germs. This is difficult to prevent, for such carriers seem able to pass through the best sanitary barriers that can be conceived. In groups of contaminated individuals who have been isolated there are phases of silence sometimes of a month, suggesting that an epidemic has been arrested, when suddenly there appears a recrudescence which can only be explained, in the absence of newcomers, by the hypothesis that very virulent pneumococci remain in the mouths of certain laborers. Sanitary measures, wearing of suitable clothing, and the strengthening of the resistance of the individual by proper diet, rich in protein and vitamins and by chemotherapy and vaccination, constitute the minimum of prophylaxis.—*Bulletin de l'Académie de médecine*, March 15, 1932.

Yawning.—The nature and physiological significance of yawning is not yet fully understood, says Albrecht Peiper, writing in the *Deutsche medizinische Wochenschrift* of April 29, 1932. The theory that yawning represents a reflex attempt of the body to overcome fatigue is not well founded, for it fails to accomplish this. It is a matter of daily experi-

ence that one yawns not to prevent tiredness but because one is already tired. Disregarding all secondary phenomena, it is at once evident that the respiratory musculature, that is, the musculature of the thorax and mouth, participates in the act of yawning. The individual who yawns inspires deeply with his mouth wide open, the inspiratory position of the thorax and the wide-open mouth is maintained for a few seconds after which expiration follows and the mouth is closed. At the close of the yawn there is often a brief standstill of respiration and a half suppressed act of swallowing. That yawning constitutes a lower reflex is seen from the fact that children quite prematurely are able to yawn quite distinctly. The known facts can be resumed in the theory that yawning is nothing more than a respiratory movement, and that it is founded on a lowering of the nervous excitability of the respiratory center by which the yawning center is inhibited. During yawning the breathing falls to a lower stage of evolutionary development. In accordance with this view the yawning center must be regarded as habitually an inhibiting constituent of the respiratory center, in the neighborhood of which it has its seat. The breathing center and the swallowing center were originally closely related. Lower animals have a "swallowing respiration," that is they breathe while they swallow. The swallowing movement that closes the act of yawning shows the close relation between these centers for in human beings too swallowing represents the lowest form of breathing. Peiper thinks that yawning occurs as the result of a transitory failure (verfall) of the respiratory center, by which the yawning center is ordinarily restrained. Whenever, as the result of weariness, this inhibitory power lets up, the released yawning center transitorily assumes control of the breathing. Hence individuals yawn not to counteract weariness but as a result of weariness already present.

Vasovagal Syncope and the Carotid Sinus Mechanism—Under the term "vasovagal syncope" Sir Thomas Lewis discusses the mechanism of common fainting attacks which usually affect the young but by no means exclusively. In uncomplicated cases patients do not speak of precordial distress or constriction. From the start there is a progressive lowering of blood pressure and usually a steep fall of heart rate to 40 or 50 (occasionally to 30 or even 20) beats per minute. Pallor becomes extreme, and is of the type associated with simple drainage of blood from the skin to dilating visceral vessels. The slow pulse is due as has been shown polygraphically, to

a slowing of the whole heart, irregularity, a common feature of vagal slowing, is often displayed. The proof that slowing is vagal is given by atropine, which promptly drives the rate to levels usual under this drug. The slowing of the heart is insufficient to induce unconsciousness. Undoubtedly, the main cause of the fall of blood pressure in these attacks and the enfeeblement or loss of pulse is independent of the vagus, and lies in the blood vessels. Atropine, while raising the pulse rate, leaves the blood pressure below normal, and the patient still pale and not fully conscious. Thus the syncope in such cases is vasomotor and not vagal, but the vagus adds to the clinical picture by inducing conspicuous slowing of the heart and gastric manifestations.

A discovery which is possibly relevant to the pathology of these attacks is that of the carotid sinus reflex. A rise of pressure within the carotid sinus results in a reflex lowering of the heart rate and of systemic pressure, the former is produced through the vagus, the latter through vasomotor channels and through an effect on suprarenal secretion. The carotid sinus reflex contains the receptor part of the mechanism, the glossopharyngeal nerve conveys the impulse to the medulla, here the impulses inhibit the heart and depress the vasomotor tone. Given this linkage it seems highly probable that the central and efferent parts of this mechanism are disturbed in the clinical syndrome of vasovagal syncope. This explanation is further supported by the fact that pressure on the carotid in man gives rise to gastrointestinal manifestations. According to this view, it is legitimate to suggest that this mechanism can be set in motion through many afferent channels other than those at present recognized by physiology. There may be an objection to the use of the term vasovagal because Gowers has used it to denote a type of attack bordering on minor epilepsy or migraine, in which the attack is entirely different from that of fainting, there being nothing in the description that justifies the use of the adjective vagal. Nothnagel has also used the term vasovagal to describe attacks which show no conclusive evidence of vasoconstriction. In both cases the use of the term is based upon guesswork and tends to confuse our thoughts.—*British Medical Journal*, May 14, 1932, 1, 3733.

A Peculiar Laboratory Sickness—According to R. Doerr, E. Berger, W. Jadassohn, and G. W. Schmidt, there appeared in 1930 and 1931 at the Hygienic Institute of the University of Basle and at the Dermatological Clinic of the University of Zurich attacks of

sickness of a hitherto unknown nature among the physicians and technicians, the peculiarity of which lay in the symptomatology and the epidemiological behavior. Clinically these were recurring attacks of fever of brief duration, lasting but a few hours, followed regularly by a stage of marked exhaustion and prostration lasting a few days. These secondary effects were the stronger, the greater the number of the attacks suffered by the individual, amounting in some cases to a complete incapacity for work and to marked psychic depression. The other symptoms were not universal, so that it remains uncertain whether they were germane to the nature of the disease, or were accidental. Such were nausea and vomiting, observed in a considerable number of cases, as well as diarrhea and anorexia. It may be recalled that this triad of brief chills and fever, a postfebrile phase and gastro-intestinal disturbances is characteristic of three infectious diseases: yellow fever, dengue, and pappataci fever, all of which are caused by some ultramicroscopic virus. It was rather frequent, but not constant, to observe between the attacks as well as during the fever a painful, dry, barking cough, different in character from that of influenza. The intermittent, cyclic course of the affection makes it possible to exclude grippe. At Basle all the cases began with a chill, followed by fever reaching 39.2-39.8° C., which fell to normal five hours later. At Zurich, while the same high temperatures prevailed, they were not present to the same degree in all the attacks of any one individual. The intervals between attacks averaged seven days at Zurich, nine to eleven days at Basle. The process conferred no immunity, the same individual being liable to a fresh cycle after an interval of 28 days. The affection was not contagious, and was confined within the institutes named. In Basle the entire six individuals affected fell ill on the same day, but their cycles were different in periodicity. The fact was brought out that at both institutes extensive experimentation with tubercle bacilli and preparations had been in progress when the attacks occurred, and that no further attacks occurred after these manipulations ceased. This coincidence may, however, have been accidental. All attempts to find a causative agent proved negative, and the attacks remain unexplained.—*Schweizerische medizinische Wochenschrift*, April 23, 1932.

The Treatment of Cardiac Dyspnea.—Convinced that if any progress was to be made in the treatment of cardiac dyspnea it was necessary to learn how to measure this symptom, T. R. Harrison devised a method by which

this can be accomplished. In a former article he showed that the degree of dyspnea was related to the nearness which the volume of breathing per unit of time approached the maximum possible value. The actual volume of breathing can be easily measured and the vital capacity is a measurement of the maximum possible volume. The degree of dyspnea, being directly proportional to the ventilation and inversely proportional to the vital capacity, can be expressed by the formula:

$$\text{Dyspnea} = \frac{\text{Ventilation}}{\text{Vital capacity}}. \text{ This formula ap-}$$

plies equally well to the resting and the active state. By means of this method a demonstration has been made of the value of such well accepted therapeutic measures as rest and venesection. It was shown that the slightest muscular exertion predisposes to dyspnea in persons with cardiac disease. Digitalis was found to be the most potent single weapon available in combating cardiac failure. There has been no general agreement as to whether digitalis is of value in patients with cardiac disease and no symptom other than dyspnea. A study of the effect of the drug in 42 cases showed that patients with paroxysmal attacks of nocturnal dyspnea were very much benefited. The effects in patients whose only symptom was dyspnea on the performance of muscular work were less dramatic, but in two-thirds of the cases subjective improvement was obtained. In obese patients reduction of the body weight was followed by improvement in the dyspnea. The value of theophylline was demonstrated, not only as a diuretic, but in combating dyspnea in persons with no edema. On the basis of these findings a plan of treatment has been developed. Asymptomatic patients who have definite signs of heart disease, are given a diet to reduce weight gradually, but are never given drugs. In patients with limited cardiac reserve, in whom dyspnea results from minimal bodily effort, digitalis is indicated in amounts of 1.5 to 2 grams in four or five days. Following this a daily dose of 0.1 to 0.2 gm. should be given and continued during the rest of the patient's life. If digitalis fails to relieve the patient's symptoms theophylline is administered; subjects vary greatly as to the amount of the drug they will tolerate. Most patients take 0.3 gm. after supper and after breakfast. This drug should be discontinued when dyspnea is relieved. In patients with congestive heart failure with edema, the Karel diet, salyrgan, and venesection are often especially helpful. Morphine may be used occasionally, but codeine is preferable.—*Southern Medical Journal*, June, 1932, xxv, 6.

Cerebral Impaludation—Ducoste, in a paper read before the *Academie de médecine* on April 12, 1932, reports that he has up to the present time treated 108 cases of general paralysis with cerebral impaludation, by which term he means, in contradistinction to ventricular impaludation, the injection directly into the frontal lobes of 2 to 5 cc citrated malarial blood. He had previously proved that injections into the white substance cause no pain or shock, having employed the method not only in animal experimentation but also in cases of dementia præcox, encephalitis, and manic depressive psychosis. He had also demonstrated that good results are obtained only from the use of the blood and not of the spinal fluid or serum, of malaria patients, the latter having no therapeutic effects and causing no reaction. Cerebral impaludation, like simple impaludation, causes crises of fever, the time of incubation is on the average a week. The tertian type is the most frequent, with the temperature rising spontaneously to 41° C (106° F). Irregular curves are not infrequent. As a rule there are 10 to 15 chills, the fever burns itself out, quinine is generally useless. Cerebral impaludation is better tolerated than simple impaludation. Destructive effects upon liver and spleen are rare although the spleen can be percussed and the liver may exhibit some congestion. Cardiac complications are exceptional and there are no gastroenteric disturbances. The mortality is much lower than in classic impaludation, and amounts to 1.4 per cent. A certain number of paretics, however, were in the last stages of their disease, and would probably not have tolerated simple impaludation. The general condition of these paretics is always very favorably influenced by the cerebral injection. But it is the mental effects that are especially brilliant, particularly in those patients who are not yet profoundly affected by the disease and who are treated at the outset. Even in the least favorable cases the course of the disease is arrested and stabilized, while the mental faculties may remain weak, the incontinence ceases and the agitation or torpor disappears, in many cases the general condition is remarkably improved. In 21.4 per cent of the 80 cases of which a special report is made the patients were completely cured so that it might be said that their paresis became only a memory. In 45 per cent improvement was sufficient to admit of the patients resuming their occupations, especially if the work did not demand much initiative. Ducoste is convinced that while most of the symptoms dur-

ing cerebral impaludation are due to general infection, there is a specific encephalic process evolving at the same time, to which results are attributable.

Epidermophytosis (Athlete's Foot) a Cause of Serious Streptococcal Infections.—John Homans, writing in the *New England Journal of Medicine*, May 19, 1932, cvvi 20, asserts that streptococcal infections, entering by way of local lesions of epidermophytosis, are now so very common that any lymphangitis or cellulitis of the leg not clearly traceable to infection of a hair follicle or some trivial wound is almost certain to be due to this cause. Medical men are by no means aware of the frequency of these infections. At the time this paper was written there were in the wards of the Peter Bent Brigham Hospital two boys incapacitated for several weeks by streptococcal infections grafted upon epidermophytosis. Such lesions are by no means confined to boys and girls, but are seen in adults as well. The chain of events in a case described by Homans was as follows: epidermophytosis secondary hemolytic streptococcal infection, acute lymphangitis and lymphadenitis, cellulitis, secondary abscess of the inguinal and popliteal lymph nodes and a deep abscess of the thigh. This represents, short of a fatality, the high water mark of such infections. A mild form of the disease might be marked by a few days of lymphangitis of the blushing reticular sort without extension to the groin, or of the common tubular sort leading to a swollen inguinal lymph node. Even in such cases, chills and considerable fever would be expected but, more often than not, no local change in the region attacked by the epidermophytosis would be evident. The cure of epidermophytosis is notably difficult, but its spread can undoubtedly be checked if not altogether controlled by certain preventive measures. These include the general use of a powder containing 20 per cent sodium thiosulphate in boracic acid, the installation of a shallow pool, filled with an appropriate fungicide, through which everyone using swimming pools and showers must walk, the use of rubber slippers, the prolonged steam sterilization of towels, etc. A more general realization of the dangers attendant upon the disease should lead to a widespread support of such precautions and a continued search for the ideal treatment of the local lesions. Honan describes the method of identifying the fungus by means of direct microscopical examination of material from the eruption and by means of cultures.

LEGAL

DR. JOHN A. CARD

Dr. John A. Card, Speaker of the House of Delegates of the Medical Society of the State of New York, died at his residence in Poughkeepsie on the 28th of June. It is almost impossible to believe that John Card has left us forever. In his death every member of the State Society has lost a true friend, and the Society itself has sustained an irreparable loss. It is only fitting and proper that in this issue of the Journal the column assigned to your Legal Counsel for the presentation of legal topics should contain a remembrance of our deceased friend. He was extremely interested in the Legal Department of your Society.

For many years, as Chairman of the Insurance Committee he rendered magnificent service in the many problems that came before him, and he was especially active and interested in educating the members of your Society in the benefits of our group plan of insurance. It was his custom to go about the State every year and speak to the various County Societies and District Branches on this subject.

When the late lamented Dr. E. Eliot Harris was compelled by declining health to resign the office of Speaker, the mantle which he had worn so ably for many years was placed on the shoulders of John Card. How well he performed this arduous and difficult task is known to all of you. He possessed the faculty of breaking the

tension of any situation with a well-chosen, timely and humorous remark.

Dr. Card was indeed a lovable character. Thoughtful, kind and generous, he spared neither time nor energy in his devotion to the ideals for which your Society was founded. As a physician he was very highly regarded in his chosen field, that of pediatrics, and he won the respect, admiration and affection of his patients and his colleagues. He served the County of Dutchess for many years as Coroner, and only recently had been appointed to the post of Medical Examiner in that County. In the capacity of Coroner and of Medical Examiner, he was called upon to testify many times in the courts of this State in important criminal cases, and his character, integrity and ability won him the respect of judges and juries alike.

In his personal life John Card was a delightful social companion. It was a treat and a pleasure to watch him play the role he loved so well and filled so delightfully, that of host to his numerous friends. John Card is dead, but the memory of our associations with him will live forever.

"Green be the turf above thee,
Friend of my better days,
None knew thee but to love thee
Nor named thee but to praise."

FRACTURE OF TIBIA AND FIBULA

In this case a seventeen year old girl had met with an automobile accident and was taken to a private sanitarium where a local physician examined her, and finding her leg to be severely fractured called upon the defendant, a specialist in orthopedic work, to take charge of the case. He examined her and found a compound fracture of the tibia and fibula. As there was no x-ray available at the said sanitarium, he had her removed with the leg in temporary splints to another sanitarium where an x-ray and a fluoroscope were available.

X-rays showed a marked compound comminuted fracture of the tibia and fibula. The tibia showed an oblique fracture with displacement anteriorly and inward with a small piece lying between the two fragments. The fibula showed a double fracture with displacement and

overlapping. The doctor considered an open operation but decided to attempt closed reduction under the fluoroscope. While complete anatomical reposition was found impossible, the last position under the fluoroscope showed correction of the lateral displacement, with but slight overlapping on lateral view. A plaster cast was applied extending from the toes to the knee, and an x-ray taken through the cast showed satisfactory position.

The doctor saw the patient the next day, bivalved the cast, found no bleeding and the leg in good condition. The doctor ordered the wound to be dressed daily and an application of light to be given to avoid possible infection. The patient remained in the hospital for about two weeks and was seen daily by the doctor. During this time the wound was dressed daily and lamp

treatment and short time exposures to the air were given. Before the patient left the hospital other x-rays were taken which showed that the position obtained at the reduction was retained. The patient then returned home under the care of her family physician. About a month later the doctor next saw the patient. His examination then showed a straight leg, no swelling, and freedom of the ankle. He took the leg out of the cast and tested it, and it showed some evidence of union. He advised further baking and massage and ordered a brace. He also ordered x-rays but the patient did not have them taken.

About three weeks later the doctor next saw the case, and upon a physical examination he found some union, good shape and no shortening. With a brace the patient at that time was able to walk. Again the doctor ordered x-rays, and again they were not taken.

Four weeks later the patient was again seen by the doctor and at that time she had had x-rays taken. She was then walking with a cane, and had against the advice of the doctor attempted to dance. She was able to bend down; her knees were at the same level; there was no lateral deviation; but there was some shortening. The

x-rays showed all the fragments in place and callus formation. There was evidence of the beginning of bony union, and no evidence of osteomyelitis. There was, however, an overlapping. He at that time informed the patient that the shortening might be bettered by an open operation.

Some days later she went to another specialist in orthopedic surgery and an open operation was performed, and some months thereafter a bone graft operation.

Suit was brought against the doctor for malpractice, claiming that through his entire treatment he had failed to properly care for the case so that as a result at the end of about three months there was still no union in the leg and there was malposition of the fragments so as to require subsequent operations.

The case was tried before a judge and jury and the testimony took three days to be put in for both sides. At the conclusion of the entire case the judge directed the jury to take a recess, so that counsel could argue the defendant's motion to dismiss. After an extended argument the court granted the motion to dismiss, thereby concluding the suit in favor of the doctor.

REMOVAL OF APPENDIX DURING OPERATION FOR HERNIA

A young man consulted the defendant physician with respect to a condition of hernia from which he was then suffering, and the doctor on examining him found that he had an inguinal hernia and suggested an operation. The patient consenting, the doctor had him enter a hospital where he was put under a local anaesthetic. The doctor made an incision into the sac and found the patient's appendix badly inflamed. The patient at that time was completely conscious, talking with the doctor, so the doctor told him that the appendix was in the hernial sac and would have to be removed. The patient told the doctor that he should by all means take it out. The doctor thoroughly cocaineized the area around the appendix and removed it. He then closed the wound without a drain, and the patient remained under the doctor's care for the next three weeks, at the end of which time the patient went home from the hospital with the wound completely healed.

The patient thereafter started suit against

the doctor, setting up two separate causes of action. The first claim of the patient was that the doctor had advised him that the hernia operation would be a simple one and would require only a few days' hospitalization, but that the defendant negligently cut too deep into the plaintiff's body so as to cause inflammation for a period of several weeks, with resultant permanent injury. The second claimed cause of action against the doctor was that the doctor, without the consent of the patient, improperly and unlawfully removed the patient's appendix although he was not suffering from any appendix trouble at the time.

The case was noticed for trial, and when reached for trial on the calendar call the plaintiff was not prepared to proceed with the trial of the action. The defendant's attorney, therefore, moved to dismiss the complaint and the motion was granted, thus terminating the matter in favor of the defendant.

NEWS NOTES

JOHN ALLING CARD, M. D.

Doctor John Alling Card, who died on June 28, 1932, was born in Poughkeepsie, N. Y., May 20, 1877, the eldest son of the late Silas E. and Eva Belle Alling Card. After graduating from the Poughkeepsie High School at the age of 16, he entered Columbia University. He completed his medical course in the New York University Medical College in 1898, and served as an interne on Blackwells Island and Bellevue Hospital. In the fall of 1898 he returned to Poughkeepsie as a general practitioner. He served as physician for the City of Poughkeepsie, and made a special study of pediatrics, doing bedside work with the late Dr. Holt at the Babies Hospital in New York for eight years.

Dr. Card was attending pediatrician on the staff of Vassar Brothers Hospital and consultant in this specialty on the staffs of St. Francis and Bowne Memorial Hospital, Poughkeepsie, N. Y., and Northern Dutchess Hospital at Rhinebeck, N. Y. He organized the child welfare work of the City of Poughkeepsie during 1907, and gave of his time liberally in developing well-baby clinics. For many years he had been in charge of the well-baby clinic sponsored by Mrs. Vincent Astor, at Rhinebeck, N. Y. He was a member of the American Society of Teachers of Pediatrics.

When the Poughkeepsie Board of Health developed a department of Child Hygiene in 1907, he was made its Director and held that position until the time of his death.

He was elected Coroner of the County of Dutchess, November, 1917. He held this office, or that of Medical Examiner, up to the time of his death.

Dr. Card served in many legal cases throughout this section as an expert witness and was considered by the legal profession as well as by physicians, to have great ability along that particular line and to render testimony which was just and impartial. Both lawyers and judges often sought his advice, and gave great weight to his opinions in the adjustment of their cases.

Dr. Card had been an outstanding man in the Dutchess-Putnam Medical Society since the early days of his practice of medicine in Poughkeepsie, and had served as its secretary, president, chairman of the Committee on Legislation, and chairman of the Committee on Public Relations. Seldom was he absent from a meeting. He was first secretary, and then later president, of the Poughkeepsie Academy of Medicine which some years ago was merged with the Dutchess-Putnam Medical Society. His leadership was recognized by all members of the Society.

In 1925 he was president of the Second District Branch of the Medical Society of the State of New York.

He has served continuously as member of the House of Delegates of the Medical Society of the State of New York from the Dutchess-Putnam Medical Society for the last sixteen years. When he was president of the Second District Branch in 1925 he was appointed to the Executive Committee of the Medical Society of the State of New York, and has been continuously reappointed year by year, and was serving in that capacity at the time of his death.

He was elected Vice-Speaker of the House of Delegates of the Medical Society of the State of New York in 1926 serving two years, when by reason of the illness of the Speaker, Dr. E. Eliot Harris, he was advanced to the office of Speaker at the annual meeting in Albany in May, 1928; and has since been elected annually to that office. He has served continuously as a Delegate to the American Medical Association since 1926.

The social side of Dr. Card's life was expressed in his membership in the leading fraternal and civic organizations of his native city.

The medical profession and the people of Dutchess County will miss Dr. Card; and it will be a long time before the community can develop another such masterful leader in professional, civic, and social life.

JAMES E. SADLIER.

DR. GEORGE W. ROSSMAN

Dr. George W. Rossman, who was identified with the practice of medicine in his native village of Ancram, Columbia County, for three score years, died on June eleventh, aged

ninety-one years. His father, Dr. Peter P. Rossman, had begun the practice of medicine in Ancram in 1825; and the son of Dr. George W. Rossman, Dr. Clark G. Rossman, still

practices in Hudson. The practice of the three generations of doctors therefore extends over a period exceeding a century, all spent in Columbia County. (See this Journal, February 1, 1929, page 174)

The *Hudson Register* of June 11, 1932, contains the following note regarding Dr. Rossman's character:

"Dr. Rossman was zealous in educational matters and good government. He kept aloof from office holding, his chief desire being to maintain a foremost position in his profession, which he did for many years, before his advanced years brought about retirement. He took much interest in historical matters of this section."

SUFFOLK COUNTY

The regular semi-annual meeting of the Suffolk County Medical Society was held at the Brunswick General Hospital, Amityville, N. Y., Thursday, April 28, 1932. President Dr. Charles C. Murphy, presiding. About 75 members and guests were in attendance.

Dr. W. H. Ross, for the Committee on Medical Economics, reported on the agreements with the County Commissioner of Welfare in regard to the treatment of the poor by private doctors and hospitals, and the excellent results that have been attained.

Dr. Frank Overton, for the Committee on Public Health and Medical Education, reported as follows:

"The Public Health Committee of the Suffolk County Medical Society has two functions:

"1. To suggest the measures which public officials should adopt in order that medical service shall be available to all classes of people.

"2. To promote the practice of preventive medicine by physicians.

"The first has been carried out to perfection by the accomplishments of the Suffolk County Medical Society along three major lines:

(a) The establishment of the County Tuberculosis Sanatorium.

(b) The establishment of the County Health Department.

(c) The development of a workable agreement of the physicians with the Commissioner of Welfare in regard to the care of the indigent.

"The County Health Department provides a way for giving forms of medical service to those who formerly could not obtain such service. The best example of such action during the last six months has been that providing clinics for treating crippled children. The committee considered and approved a plan by which Dr. F. S. Child of Port Jefferson should conduct clinics for crippled children at the expense of the County. This work is done in Suffolk County more smoothly and efficiently than in any other county.

"The County Health Department has relieved the medical profession of Suffolk County of the exasperating details of medical administration.

If the Suffolk County Medical Society suggests a necessary method in medical administration, the County Health Department adopts it.

"The second object of the Public Health Committee—that of the practice of preventive medicine—has consisted largely in education. The Suffolk County Medical Society has never adopted the methods of super-salesmanship. It has not made extravagant promises of super-health to follow the observance of ritualistic precautions. It has not adopted catchy slogans of half truths, such as 'Sickness is a crime.' It has made its appeal along the lines of scientific medicine, and the people have responded because they have faith in their physicians, and believe that they can do what they say they can do. The faith of the people in the medical profession of Suffolk County is the best guarantee of a high standard of public health."

Dr. L. F. Garben, for the Child Welfare Committee, reported on diphtheria prevention.

The following doctors were elected to membership:

Drs. Thomas Mumford Winston, Sayville; Isadore Schnap, Kings Park; George E. Carlin, Amityville; Joseph L. Byrne, Bay Shore; and William A. Gollick, Kings Park, and by transfer from Kings County Medical Society, Dr. Joseph H. Kris, of Eastport.

Dr. W. H. Ross read tributes to eight members who had died during the past year.

Dr. J. B. Healey reported for the Public Relations Committee and said:

"The best and only way to provide for the well being of the citizen is to see that we look out for the well being of the physician. Organized health work is important and must go on, but just as important is the individual work of the practitioner, whose efforts are not to be hampered by too much competition in the way of free and nominal pay clinics. Many of the hospitals today have gone into the business of the practice of medicine. They contract with corporations to provide medical care at a fixed rate. All this is done at the expense of the doctor. It is not fair."

The members dined together at noon as guests of the Hospital.

KINGS COUNTY

From the June Bulletin of the Medical Society of the County of Kings .

The Month of May: Over the desks of the personnel of the County Society flows an ever-increasing amount of work. The activities of the offices of the Secretary, the Treasurer, the Librarian, the Committee on Public Health, the Committee on Medical Economics, the Committee on Legislation, and of the Committee on Illegal Practice increase as the committee work increases, and the profession expresses its opinion of what should constitute the County Medical Society's procedure. The increasing number of committee meetings and conferences shows no signs of abatement and indicates that committee work will continue during the summer recess.

The Director of Medical Activities was in the field a considerable portion of the month of May. He visited farms whose milk is certified by our Milk Commission; attended the annual meeting of the American Association of Medical Milk Commissions in Washington, D. C.; attended the annual meeting of the State Medical Society in Buffalo; visited a section of Brooklyn in which it is rumored that a dispensary is to be established; addressed the nurses of the Metropolitan Life Insurance Company; addressed a luncheon group on the subject of medical facilities of the Bedford section in which our building is located; and moved around quite a bit in planning for the Spring meeting of the Second District Branch.

The Society office has not been informed whether appropriations will be made available for the City to provide for a continuance of home relief and thus maintain service to the acutely ill. But very few bills for professional services have been submitted for approval of payment.

The month has been no different than usual with regard to inquiries from the laity. Some have been answered, some have been referred to committees for consideration and some have been forwarded to the State Department of Education by the Committee on Illegal Practice. The Department has continued its cooperation with this Committee, reporting from time to time.

The Brooklyn Cancer Committee received the resignation of Mr. Matthew Sloan as Treasurer at its last meeting, and elected the Director of Medical Activities to this position, as well as that of Secretary of the Committee.

The Coordinating Committee of the Five County Medical Societies did not hold its regular meeting in May because of the State Society meeting in Buffalo. It will meet in June. The Coordinating Committee's statement with regard to the Cullman report was submitted by the House of Delegates of the State Society following its approval by the various individual county societies. The Coordinating Committee, at its April meeting, appointed the President of Kings County chairman of a subcommittee to consider the municipal hospital law. This subcommittee met at the chairman's office and was composed of four representatives from New York County, three from Bronx, three from Queens and seven from Kings. The subject is being considered for the purpose of reporting to the June meeting.

The Committee on Medical Economics has held one meeting since the Society meeting in May, and is working on the many suggestions received from the Society and individual members of the profession.

ROCKLAND COUNTY

The June meeting of the Medical Society of the County of Rockland was held on Wednesday, June 22, 1932, at the Rockland State Hospital, Orangeburg, and was unusually well attended by the physicians of the county. There were also present an invited group of hospital workers and public health nurses.

Following a delightful luncheon provided by the hospital staff, the scientific program was presented.

Dr. Russell E. Blaisdell, Superintendent, gave the address of welcome, and described the history of the hospital and the function of the various units in the institution, as well as the future plans for development.

Dr. Henry M. Chandler, First Assistant Physician, explained the importance and proper use of

the forms for commitment of the insane prescribed by the Department of Mental Hygiene, copies of which were distributed to all present. Dr. Chandler showed that there are several methods of entering patients in the hospital besides a formal commitment on an adjudication of insanity. Patients may be admitted on their voluntary consent, provided the physician makes the proper application, as he would to an ordinary medical and surgical hospital.

Dr. A. M. Stanley, Clinical Director, and his staff, gave a clinical presentation of typical types of the more common mental disorders.

Following the scientific session, many of the physicians and guests accepted an invitation to inspect the institution.

W. J. RYAN, *Secretary.*

THE DAILY PRESS

EXPERIMENTAL WITCHCRAFT

Governmental authorities three or four hundred years ago did not put the theory of witchcraft to the test of actual experiment, probably because they feared that the test would really work. But the *New York Herald Tribune* of June 20 describes two tests which have been made recently as follows:

"The experimenters who gathered last week atop the Brocken in Germany to try to turn a goat into a man by ancient witchcraft, the directions for which were dug laboriously out of long forgotten tomes, were the second modern group to take witchcraft seriously enough to try it.

"A few weeks earlier, in Accra, Africa, authorities of the Christian religious denominations offered a prize to any native wizard who could make good in the presence of a Christian committee the wizards' familiar claims to open locked boxes, to eat fruit without approaching it or to turn themselves into animals. According to latest reports, no wizard has taken up the challenge. Perhaps, like the experimenters on the Brocken,

the wizards were persuaded really to try their spells in preparation for the test and found them worthless.

"It is a significant philosophic landmark that people of some distinction would think it worth while to try the goat-man metamorphosis, not because they either expected it to work or expected it not to, but because they deemed the result of a trial of some importance. Whatever men may say nowadays that they deem the test of truth, it is evident that the world finds this test more and more in the simple device of try it and see.

"There is deep interest for the student of folklore in this myth of metamorphosis which lies behind both the Brocken experiment and the challenge to the African wizards. Every race has this myth, much as all have their myths of fire and of the flood. It is coming to be believed too, that there is no widespread myth without some kernel of truth behind it. Ogres may be recollections, Mr. Wells tells us, of Neanderthal man."

INFLUENZA SET TO MUSIC

The *New York Herald Tribune* of June 23 has the following comments in an attempt at a musical interpretation of the symptoms of influenza which won a place in the exhibit of the Canadian Medical Association:

"Complaints that modern jazz is irritating enough to induce a nervous headache or an attack of St. Vitus's dance are not uncommon. But to reverse the situation and find a disease honored with a musical interpretation is a rarity. With influenza as his theme, a Canadian doctor has written a piece of music in symphonic form called 'Influenza—a Tone Poem.' The manuscript is exhibited in Toronto as part of a 'hobby display' in connection with a meeting of the Canadian Medical Association.

"Its four movements are described by the composer as: Preliminary symptoms; Onset of the disease; The disease, and Convalescence. Clarinets interpret the 'chills-and-fever motif' of the early stages. A jew's-harp vividly suggests a pounding headache. The third movement reaches its climax in a brilliant 'delirium crescendo.' The weary but peaceful atmosphere of convalescence is expressed in the 'stately and noble' measures of the finale.

"If the popular success of 'Influenza' depends on the number of people who have suffered from attacks of it, the tone poem should be an instant hit. Were it possible to play the music in a realistic enough way to insure immunity for the audience, the doctor's fortune would be made."

AUTOMOBILE DANGERS IN NEW YORK CITY

The *New York Times* of July 7 describes the excellent record of New York City in fatalities caused by automobiles, and makes the following comment:

"While there were a few more deaths here in the first four months of this year than in the

same period of 1931, New York still seems able to keep down motor vehicle casualties better than most of the other big cities. The 1932 rate for the twelve largest cities, as quoted in the latest Police Department Bulletin, is shown in the following table:

MOTOR VEHICLE FATALITIES

Cities	1932	Rate
1 Boston, Mass	107	10.7
2 New York City	145	14.5
3 Buffalo, N. Y.	153	15.3
4 Milwaukee, Wis.	155	15.5
5 Philadelphia, Pa.	170	17.0
6 Baltimore, Md.	179	17.9
7 Detroit, Mich.	200	20.0
8 San Francisco, Cal.	204	20.4
9 Cleveland, Ohio	218	21.8
10 Pittsburgh, Pa.	220	22.0
11 Chicago, Ill.	263	26.3
12 Los Angeles, Cal.	302	30.2

"The rate is based upon the fatalities for each 100,000 of population. Only Boston has a better record than New York. That city has had the

benefit of expert traffic advice from Professor McClintock and his Harvard associates, and of continuing police efforts at improved control. Considering the intricate street pattern of Boston, they seem to have been remarkably successful.

"Whatever may be said in criticism of this city's plan from the point of view of housing, esthetics and even transportation, the shuttle system of traffic control to which it readily lends itself does appear to make for greater traffic safety.

"The efforts of our police officials are to be commended. Amateur traffic reformers from the West often write letters to the editors of Eastern newspapers describing how much better they order these things in California cities, especially Los Angeles. Unfortunately, the statistics are against them."

CHOLERA A CENTURY AGO

The New York *Sun* of July 1 has the following editorial on the observance of Independence day a century ago:

"Of another July 4, that of one hundred years ago, Philip Hone made this regretful entry in his diary:

"It is a lovely day, but very different from all previous anniversaries of our independence. The alarm about the cholera has prevented all the usual jollification under public authority. There are no booths in Broadway, the parade which was ordered has been countermanded, no corporation dinner, no ringing of bells. Some troops are marching about the street, upon their own hook. I suppose most of the stores are closed and there is a pretty smart cannonade of crackers by boys, but it is not a regular Fourth of July. The disease is here in all its violence and will increase. God grant that its ravages may be confined and its visit short!"

"It was a sad year for New York. The cholera

having swept Europe, had reached Quebec from Ireland and spread with terrifying rapidity. It first appeared in New York in a house on Cherry Street near James Street on June 25. By July 3 the Board of Health felt it necessary to appoint a special medical council consisting of Dr. Alexander H. Stevens, Dr. Joseph Bayley, Dr. Gilbert Smith, Dr. John Neilson, Dr. William J. McNeven, Dr. Hugh McLean, Dr. Richard K. Hoffman and Dr. Anthony L. Anderson. New York's population had just turned 200,000, there were 5,835 cases of cholera with 2,996 deaths, although thousands of persons left the town. Mayor Walter Bowne had a hard job. He and his fellow citizens did their work to the best of their ability. Wilson wrote, in the 'Memorial History': 'The conduct of the gentlemen of the city in this time of distress was beyond all praise.' If the gentlemen of the city in the present time of trouble continue to follow the course they have kept, another historian will write as well of them."

THE PSYCHOLOGY OF MUSIC

If you were asked to make out a program for an outdoor concert in the Park and wished the music to comfort and cheer the listeners in this time of depression, would you choose sad or lively tunes? A Boston conductor approaches the problem in a scientific way with the result that is described by the *New York Times* of July 7, as follows:

"Arthur Fiedler, conductor who is preparing for Boston's open air Esplanade concerts, has been deluged with suggestions for his programs. Among the hundreds of letters received have been many dealing with the depression and a proper musical recognition of it in concerts.

"Instead, Mr. Fiedler visited a psychologist of note, who, to his amazement, suggested that "sad music" was most fitting to those who feel depressed and worried.

"A grieving person is to be compared with a person in a depressed mental state," said the psychologist. "A grievous person desires to be alone with his grief-stricken thoughts or in sympathetic company."

"Play gay music to cheer him up, and instead of cheering him you outrage his feelings just as much as if you introduced frivolous music at a funeral of one of his dear ones."

BOOK REVIEWS

MANUAL FOR THE JEWISH DIABETIC. By WILLIAM S. COLLENS, B.S., M.D. Octavo of 138 pages, illustrated. New York, Bloch Publishing Company, 1931. Cloth, \$2.00.

In the older routine diabetic diets one almost invariably encountered bacon as part of the daily allowance. To the orthodox Jew this was just adding insult to injury. Recently high fat diets have not been so much in vogue and it is quite easy now to arrange a diet for a Jewish diabetic without using bacon and without adding cream or butter to the meat meal. Now along comes Dr. Collens and adds gefilte fish, Hungarian goulash and blintzes. This ought to make the Jewish diabetic live to eat instead of just eating to live.

This book contains one whole chapter entirely devoted to typical Jewish recipes which not only satisfy the mandates of the Jewish religion, but tickle the Jewish palate. This will be of distinct help to the patient, the doctor and the dietitian.

The rest of the book contains the material usually found in most books of this nature. This is presented in a clear intelligent manner and makes easy reading. The illustrations are well done and are extremely helpful.

The only criticism one could make would be that in some parts the information is too technical for the average patient.

BENJAMIN DAVIDSON.

THE NOTE-BOOK OF EDWARD JENNER. In possession of the Royal College of Physicians of London. With an Introduction on Jenner's Work as a Naturalist by F. DAWTREY DREWITT, M.D., F.R.C.P. Octavo of 49 pages, illustrated. New York, Oxford University Press, 1931. Boards, \$1.25.

This historic manuscript Note-Book of the celebrated Edward Jenner, has now appeared in printed form for the first time. The original was presented to the Royal College of Surgeons by Dr. Jeffrey Marston in 1888, but there is no record of how Dr. Marston came into possession of the Note-Book.

The notes made by Jenner covered the period extending from the year 1787 to 1806, and contain his important contribution as a naturalist, namely, the study of the habits of the cuckoo. With infinite patience and minute observation, he worked out the manner in which the young cuckoo ruthlessly destroys young birds of other species by throwing them out of their own nests. Jenner also records certain observations on distemper in dogs and on the occurrence of hydatids in various animals. In neither case, however, did any important addition, to our knowledge, result from these last two studies. The book is of interest to the medical historian and to the naturalist.

JOSEPH C. REGAN.

NOTES ON CHILDREN'S NURSING. By MARGUERITE C. ERXLLEN, R.N., B.S. Octavo of 242 pages, illustrated. Philadelphia, F. A. Davis Company, 1931. Flexible cloth, \$2.00.

This is an excellent book for the guidance of nurses in the care of children. It is the result of eight years' intensive study and observation of children's nursing by the author.

The book is divided appropriately into three main parts. Under General Routine Duties is appropriately grouped description of the Admission and Discharge of Patients, Daily Hygienic Procedures, Charts and Reports, Bed-Making, Methods of Bathing the Child, and of making the child comfortable, and finally, Special Nursing Technique under various conditions.

The Preparation of Foods includes two chapters, one dealing with Infant Feeding and the other the Preparation and Serving of Food. The third portion of the book, devoted to Procedures and Treatments, is particularly important, and gives an excellent description of the various methods used in the nursing of children.

This is a timely and a useful book that should be of value to all those who are responsible for the care of convalescent and sick children. It is attractively printed and bound.

JOSEPH C. REGAN.

ALLERGY AND APPLIED IMMUNOLOGY. A Handbook for Physician and Patient, on Asthma, Hay Fever, Urticaria, Eczema, Migraine and Kindred Manifestations of Allergy. By WARREN T. VAUGHAN, M.D. Octavo of 359 pages, illustrated. St. Louis, The C. V. Mosby Company, 1931. Cloth, \$4.50.

While intended solely as a hand book for the patient and not as a text book for the physician "ALLERGY" by Warren T. Vaughan, is a book well worth reading for both. It is written in a clear, distinct style with a delightful vein of humor.

The discussion of hay fever is very complete and answers all possible questions. He describes the phenomenon of Pollination and shows photographs of the common plants. Charts describe the geographic distribution and pollinating seasons of plants. He describes the pre-seasonal and perennial types of treatment.

The chapters on foods are fascinating. He groups the foods according to evolutionary relationship and shows the advantages of group testing. The Elimination Diet and Food Diaries will prove helpful and instructive for cases of food sensitization.

The chapter on general instructions should be read and re-read by Allergic patients for it contains simple and sensible rules. It is a delightful and instructive treatise that can be easily understood.

DOROTHEA E. CURNOW.

HANDBOOK OF SKIN DISEASES. By FREDERICK GARDNER, M.D. Third edition. 12mo of 283 pages, illustrated. New York, William Wood & Company, 1931. Cloth, \$3.50.

This book of 273 pages has for its purpose the giving of general information regarding all but the rarer skin diseases to the general practitioner and the medical student. It is intended that here one shall find sufficient information to differentiate these various diseases, and includes a few suggestions as to their treatment. Having arrived at the diagnosis, reference may readily be made to the more comprehensive texts in dermatology for a more complete description and discussion of the varied types of therapy considered to be effective.

The book is well printed in good type which tends for easy reading.

E. ALMORE GAUVAIN.

MAN AND MICROBES. By SIANHOPE BAYNE-JONES, M.D. 12mo of 128 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1932. Cloth, \$1.00. (A Century of Progress Series.)

This little book is one of the Century of Progress Series, the purpose of which is to "depict the last hundred years of intellectual endeavor."

It is written for the intelligent layman, who can understand the chemical and physiological terms the author uses, and will enable such a reader to understand the useful and necessary things accomplished by bacteria, as well as the destructive ones.

ISIDOR COHN.

A TEXT-BOOK OF PSYCHIATRY FOR STUDENTS AND PRACTITIONERS By D K HENDERSON MD FRPS and R D GILLESPIE, MD, MRCP Third edition Octavo of 595 pages New York, Oxford University Press 1932 Cloth, \$4 50 (Oxford Medical Publications)

This book from the first created upon the reviewer a favorable impression which gained strength with the progress of the review. The first six chapters are devoted to useful preliminary considerations covering a review of the care and treatment of mental cases, classification, etiology, examination methods, general symptomatology, and psychopathology, all of which quite logically lead up to a consideration of the definite reaction types. The latter, it is believed should have a strong appeal, particularly to those who have studied in the New York State Hospitals.

The psychotic reactions are discussed from a broad and conservative viewpoint with ample attention to various influencing factors and the interpretation of mechanisms involved. The organic syndrome is expressed in a way to give the reader a good understanding of the fundamental changes in these cases.

A chapter on Psychiatry of Childhood should be a useful guide to the care and treatment of problem children. Occupational Therapy is given a place of deserved importance and many useful suggestions are made. The book is conveniently arranged for reference or study purposes and should be a most helpful addition to any library.

A E SOLER

RECENT ADVANCES IN BACTERIOLOGY AND THE STUDY OF THE INFECTIONS By J HENRY DIBB MB FRCP Second Edition Octavo of 476 pages illustrated Philadelphia, P Blakiston's Son & Co Inc 1932 Cloth, \$3 50

The excellence of the previous volume with the same title published in 1931, has been surpassed in the 1932 edition. The present volume accomplishes somewhat more than the title indicates since most valuable reviews of current topics in the fields of bacteriology and infections are discussed. The subjects are presented in the author's lucid, terse and entertaining style. They are not colored by opinionated or personal reactions, and impress the reviewer as a fair and unprejudiced service of the facts as they exist, predicated on knowledge at hand. The reading matter is refreshingly free of speculation and imagination. Of especial interest are the chapters on the filter passing viruses and Rickettsia. For the physician and bacteriologist who wishes to keep acquainted with up to the minute knowledge in progressive medicine, this work is invaluable.

MAX LEDERER

THE NURSE'S MEDICAL LEXICON For the Use of Graduate and Student Nurses of Premedical and Dental Students of the General Public By THOMAS LATHROP STEEDMAN A.M. MD Octavo of 629 pages New York William Wood and Company 1931 Cloth \$2 00

The author has succeeded in his effort to perfect a practical medical dictionary, applicable to all branches of nursing.

The book is attractively bound and contains an appendix of Weights and Measures, Temperature Scales, Poisons and Antidotes and a Time Table of Infectious Diseases.

The words and terms are simply defined direct and easily interpreted. They include descriptions of various recognized methods of operations and treatments for correction diseases, medications, and their use and many other expressions pertaining to medicine and nursing.

In only one instance does the reviewer question the adequacy of a definition and that is the one given for 'public health nurse'. The author has not defined the accepted conception of this type of nurse, which should

include the functions of the 'health nurse' and "district nurse."

However, the reviewer does feel that the book is a fine contribution to the profession and to those outside who have occasion to consult it.

MARION BALLANTYNE.

PSYCHOLOGY AND PSYCHIATRY IN PEDIATRICS The Problem Report of the Subcommittee on Psychology and Psychiatry Bronson Crothers, MD Chairman White House Conference on Child Health and Protection Octavo of 146 pages New York, The Century Company, (c 1932) Cloth, \$1 50

This volume is just what the title implies—a report. One of its contributions is the attempt made to partially defend the general practitioner, in stating that they are capable of doing considerable good, while at the same time they are criticized because they so often neglect the emotional problems of children. It recommends that the large group of general practitioners make some effort to deal with the adjustment problems of their families under their professional care.

In the appendix excellent descriptions of outstanding groups and clinics are given. Particular reference is made to The Merrill Palmer School—Institute for Child Guidance—and Essex County Juvenile Clinic. The reviewer found these outlines to be highly instructive reading.

H R MERWARTH

CLINICAL ATLAS OF BLOOD DISEASES By A PINEL, MD MRCP and STANLEY WYARD, MD, MRCP Second edition Octavo of 105 pages, illustrated Philadelphia P Blakiston's Son & Co Inc, 1932 Cloth, \$4 00

The essential features of this valuable little book of 105 pages are its glossary, the beautiful illustrations of typical blood pictures and the conciseness, brevity and clarity of the text.

The glossary is of inestimable aid to the busy clinician or surgeon. In it one discovers clear word pictures of haematologic conditions only to be found hidden among the maze of facts in the larger volumes and likely to be overlooked. The illustrations are true to the slide. No greater tribute can be given.

It may be pointed out that the picture (plate 10) designated Chlorosis looks to all intents and purposes like Pernicious anemia. It were better that it be left out because it is confusing. It would be less confusing also that the term 'Glandular Fever' be confined to the entity discovered by Pfeiffer in 1889, in which there was a leucocytosis and neutrophilia as a part of a Grippe or influenzal epidemic with glandular enlargement and fever. The terms Infectious Mononucleosis and agranulocytosis should not therefore be confused with Glandular fever.

One may say that the clinician who is without this little volume is certainly without that last concise word in Haematology.

MAURICE MORRISON

MANUAL OF BACTERIOLOGY By ROBERT MUIR MA, MD and the late JAMES RITCHIE MD MA Ninth edition revised by CARL H BROWNING MD, DPH, and THOMAS J MACKIE, MD DPH 12mo of 866 pages, illustrated New York Oxford University Press 1932 Cloth, \$4 75 (Oxford Medical Publications)

This is the ninth edition of the British text book brought up to date by Professors Browning and Mackie. It covers all the usual ground very carefully and completely—morphology, biology, methods of cultivation and study etc.

Included in the study of the individual bacteria is a description of the immunological reactions, uses of vaccine and antisera, and methods of diagnosis.

In discussing classification of bacteria the authors briefly mention the classification of the Society of American Bacteriologists, but throughout the book, use both the old and the new terminology.

ISIDOR COHN

OUR NEIGHBORS

COLLECTION AGENCY, LANE COUNTY, OREGON

The June number of *Northwest Medicine* contains an article on what the Lane County Medical Society, Oregon, does for its members. Lane County has a population of about 55,000 scattered over an area of 4,000 square miles. The principal activity described is that of cooperation with the Dental Society in the collection of bills. Out of this grew the establishment of headquarters for the societies and educational work among the people. The article says:

"In the latter part of 1929 conferences were held by the officers of the Lane County Medical Society and the Southern Willamette District Dental Society with a view of combining forces to effect a new organization which would more nearly approximate present day needs. The recommendations which were finally adopted were briefly that space for a permanent central headquarters for the two societies be secured in a ground floor location on one of the principal downtown streets of Eugene, and that a beginning be made toward the development of a strong economic and public relations setup for the two societies.

"The first economic problem which was attacked was the improvement of collection methods for the physicians and dentists of Lane County by the establishment of a centralized credit and collection bureau in the headquarters office, under the name of the Doctor's Official Credit Bureau.

"As delinquent accounts were turned in for collection a master credit file card was made up and placed in the bureau files. Subsequent accounts concerning the same individual are recorded and put on these master cards. The information in the bureau files was then made available to the supporting physicians and dentists by telephone or mail upon their request.

"In order to facilitate further the dissemination of credit information, the publication of a mimeographed monthly bulletin was begun. This bulletin is issued in the joint name of the medical and dental societies. The secretaries act as news editors with our office manager serving as the managing editor and preparing the material. A list of the names of all delinquent debtors whose accounts have been received for collection by the bureau during the previous month, together with the amount of their indebtedness, is published in a special section of this bulletin. The bulletin also carries notices of the medical and dental societies and hospital staff meetings, news concerning the activities of the two societies and various other

items of interest to physicians and dentists. At the end of six months a special bulletin is issued, giving a list of all debtors which the bureau records show as owing two or more physicians or two or more dentists.

"As a further feature of our campaign to educate the public to pay their physician and dentist promptly, several paid advertisements were run in the local newspapers, announcing our intention of publishing in the near future a medical and dental credit rating book, and urging people owing their physician or dentist to make immediate arrangements regarding payment.

"To further assist the physician and dentist in our community to improve the business methods used in their own offices and to correlate more closely the business office of the doctor with our central bureau, a study was made of the procedure in use by the various physicians and dentists. Out of this study a suggested uniform business procedure, including a set of office forms and stationery, was devised. All the physicians and dentists were urged to adopt this procedure, so that the people of our community and their business contacts with professional men, would be received with a practically uniform approach as to the manner of arranging and paying their medical and dental obligations.

"A neat card was also devised and placed in the physicians' offices, announcing that the doctors of the county had adopted a uniform business policy, and particularly suggesting that office consultations be paid for at the time of the consultation. An important feature of this uniform procedure was the announcement to the public that physicians and dentists would expect payment on all accounts or the adoption of a definite installment plan within ninety days, and if this were not done, the account would automatically be turned over to our credit bureau for collection and entry in the master credit file.

"Coincident with the opening of our central credit bureau a public health information bureau and reading room was established in our headquarters. The Christian Scientists have long used the plan of having their literature available to the general public in a prominently located free reading room, and it seemed to us that this plan could well be adapted to the education of the public in our field. This reading room was attractively arranged with store windows for display purposes as well as wall space for exhibits of the best health education and anti-quackery material

(Continued on page 892—Adv. xii)

Summer-Time Use of Mead's Viosterol for Vitamin D* to Prevent Recurrent Rickets

No doubt during the hot weather, when fat tolerance is lowest, you will wish to do what so many physicians have found a successful practice: Transfer cod liver oil patients to Mead's Viosterol in Oil 250 D.

Due to its negligible oil content and its small dosage, Mead's Viosterol in Oil 250 D does not upset the digestion, so that even the most squeamish patient can "stomach" it without protest.

There are at least two facts that strongly indicate the reasonableness of the above suggestion:

(1) In prematures, to whom cod liver oil cannot be given in sufficient dosage without serious digestive upset, it is an incontrovertible fact that Viosterol in Oil 250 D is the antiricketic agent of choice.

(2) In Florida, Arizona and New Mexico, where an unusually high percentage of sunshine prevails *at all seasons*, Mead's Viosterol in Oil 250 D continues increasingly in demand, as physicians realize that sunshine alone does not always prevent or cure rickets.

You are invited to send for samples of Mead's Viosterol in Oil 250 D for clinical use during the summer months to replace cod liver oil.*

Mead Johnson & Co. Pioneers in
Vitamin Research Evansville, Ind., U.S.A.

* Unlike vitamin D which is relatively scarce in common foodstuffs, vitamin A (contained in cod liver oil) is fortunately abundant in the daily diet—butter, milk, eggs, and a dozen vegetables all afford vitamin A in liberal amounts.

Please enclose professional card when requesting samples of Mead Johnson products to cooperate in preventing their reaching unauthorized persons.

Please mention the JOURNAL when writing to advertisers

Eczema

LENIGALLOL

(triacetylpyrogallol)

An efficacious agent for the local treatment of various types of eczema.

To be applied in ointments of various strengths.

Write for a sample tube of 6" Lenigallol-Zinc Ointment.

Council Accepted

BILHUBER-KNOLL CORP.
154 ORCHARD AVE., JERSEY CITY, N. J.

(Continued from page 890)

available. A complete stock of pamphlets posters were also provided. In addition, information was compiled concerning our local facilities, including accurate information regarding physicians and dentists, as well as hospital and nurses, so that our headquarters might come to be the accepted clearing house for medical health information.

"Since our headquarters has been in operation we have conducted the following lay educational activities:

"1. Annual health exhibit at the county fair in charge of our Woman's Auxiliary and Graduate Nurses Associations.

"2. Weekly health news stories carefully prepared by our headquarters committee and released to all county newspapers.

"3. Establishment of a Speaker's Bureau, in which the physician and dentist members are classified as speakers according to the topics in which they are most interested.

"4. A semi-weekly radio health program on our local station.

"5. A periodic health examination week, held once a year, in which talks on this important topic are made before all the service clubs and college fraternities; motion pictures are shown in all theaters and daily news stories are carried in newspapers.

"6. Periodic classes on prenatal care in cooperation with the County Health Unit, in which patients sent by all supporting physicians receive a course of instruction approved by our headquarters committee.

"After our headquarters had been in operation for a year, the suggestion was made that we provide twenty-four-hour emergency telephone service for our physicians and dentists. The cooperation of the local graduate nurses organization was sought, as they were interested in establishing a central nurses' registry. The two projects were combined under the name of the Doctors' Office Telephone Exchange and Nurses' Registry.

"In a small community such as ours such a program can be carried on with limited financial resources. The office staff should consist (1) a capable, full-time, lay secretary, trained from the viewpoint of organized medicine, dentistry and nursing with such additional clerical assistants as necessary, (2) a field collector, (3) an attorney for collection work on a part-time basis. We have worked out the problem of providing assistants to care for the day and night telephone service by providing sleeping quarters in our offices for two premedical students, who care for the calls on Sundays, holidays and at night. In the virtue of their training these young men are especially qualified to care for this type of work.

BUILDS FOR THE YEARS AHEAD

MONONGALIA COUNTY MEDICAL SOCIETY, WEST VIRGINIA

The June issue of the *West Virginia Medical Journal* contains a paper read before the Conference of Secretaries of the West Virginia State Medical Association on January 18, 1932 by Dr. G. R. Maxwell, of Morgantown, West Virginia, describing the work of the county society of which he is secretary. Monongalia County is in the center of the northern tier of counties of West Virginia, and its principal city, Morgantown, which has 16,000 inhabitants. Dr. Maxwell says:

"The Monongalia County Medical Society was organized almost thirty years ago. It has been one of the most active and aggressive societies in the state, and has always made its influence felt in local and state activities on behalf of organized medicine.

"In the early history of our society when the members were few and interest was small and the membership fees were smaller, and no secretary had a private secretary, the work devolved almost entirely on the secretary. In order to save time and expense he had printed the programs for the entire year and delivered them to each doctor in the society. He also had a nice card, about 8 x 10, printed and a ribbon to hang it on the wall. On this card was printed 'The Medical Society Meets the First and Third Tuesdays of Each Month at 8:00 P.M.' Thus the secretary hung on each doctor's wall in front of his desk. This novel procedure took the place of the notices by mail and telephone and it worked well.

"The secretary worked entirely without remuneration and paid for the printing out of his own pocket.

"We have a membership of forty-nine. In this respect, we have the advantage over most of the societies in the state in that all the members with the exception of two live in Morgantown. Five physicians in Monongalia County do not belong. Some of them cannot get in, others have allowed their dues to become delinquent.

"We have advantages that few societies have. The University of West Virginia is here and some of our most active members teach in the Medical School. There is the utmost harmony between our society and the faculty of the Medical School.

"Another advantage we have that probably no other society has is that all our members, with the exception of three, can walk from their offices to the medical meeting in less than ten minutes. The meetings are held after office hours, thus allowing anyone that wants to attend to do so without undue loss of time.

"Another advantage we enjoy that many societies do not is that we have no factions, and most of our members are especially friendly, and work untrammelled together to promote the profession.

(Continued on page 894-ADV. W.V.)

The only food-drink licensed by Wisconsin Alumni Research Foundation to contain Vitamin D

Cocomalt is more than a flavoring for milk—it is a scientific food concentrate drink accepted by the Committee on Foods of the American Medical Association. It contains not less than 30 Steenbock (300 ADMA) units of Vitamin D per ounce.

A delicious high-caloric drink recommended for all adults and children...

especially for

**MALE NOURISHED CHILDREN CONVALESCENTS
EXPECTANT MOTHERS POST-OPERATIVE CASES
NURSING MOTHERS HIGH CALORY FEEDING CASES**

COCOMALT is recognized as a nourishing, delicious food drink for everyone. But recommended it particularly during pregnancy and lactation, during illness and convalescence—when *higher caloric feeding is indicated*. For, prepared according to label directions, Cocomalt adds 110 extra calories to a glass of milk, increasing its nourishment (food-energy) more than 70%.

Cocomalt provides extra proteins, carbohydrates and minerals (calcium and phosphorus). Children love its chocolate flavor. Comes in powder form, easy to mix with milk—HOT or COLD. Reasonable in cost. At grocers or drug stores in ½-lb., 1-lb. and 5 lb. size.

Free to Physicians

We will be glad to send a trial can of Cocomalt, free, to any physician requesting it. Just mail this coupon.

Cocomalt

* Cocomalt is a scientific food concentrate of barley malt extract, selected cocoa, skimmed milk, sugar, whole eggs, flavoring and added sunshine Vitamin D.

ADDS 70% MORE NOURISHMENT (FOOD-ENERGY) TO MILK
(One ounce per glass or cup)

R. B. DAVIS Co., Dept. 714, Hoboken, N. J.
Please send me a can of Cocomalt without cost or obligation.

COMMITTEE ON PUBLICATION

(Continued from page 893—Adv. xiii)

sional and personal welfare of the entire membership and the public at large. We surely have as harmonious a society as it is possible to have.

"Our society is active in civic affairs. The city council and the county court seek our advice in all affairs relating to public health. Our society, though it is active, never shows officiousness toward the public officials, but we strive to show them what is for the best interests of the people at large without appearing to be dictatorial.

"In this way the profession stands high with our public officials. For instance, we have rigid parking laws. It was quite aggravating to get detained at the office or bedside and come out and find a red tag on the car with a notice to appear before the city judge and receive a fine. The society sent a delegation before the city council, and the council made a ruling that the doctors could have unlimited parking time.

"The society had a neat little tag prepared to hang in the car with the doctor's name, name of car, license number, and the official seal of the city on it. The police are instructed not to disturb a car so marked. There is the most friendly spirit existing between the police and the doctors which is appreciated on both sides.

"Our meetings are held the first Tuesday in the month at 8.30 P.M. in the Junior High School library.

"It is remarkable how thoroughly our younger men go into the scientific papers they prepare for our meetings. The younger men are probably no brighter and intelligent than the older ones, but their preliminary and technical training has been of a much higher class and they are competent to discuss the subjects before them in a truly scientific and thorough manner. They are greatly appreciated by the older men, and when a consultant is wanted the younger men are generally called. The public has found out that the younger men have been highly trained in modern methods and can be relied upon to do good work."

STATE AND LOCAL CONFERENCES IN IOWA

The inaugural address of Dr. Bert L. Ecker as President of the Iowa State Medical Society, printed in the June issue of the *Iowa Journal*, discusses conferences, both State and local. A sidelight on the attitude of a few of the members of the House of Delegates is shown in the following quotation:

"A power of the component society is its representation, through one or more of its members, in the House of Delegates, which, according to our by-laws, is the law-making body of our organization. When the House of Delegates is deciding momentous questions, questions that in-

(Continued on page 895—Adv. xv)

(Continued from page 894—Adv. xiv)

volve not only finance, but scientific progress, and that body is trying to outline a policy for future constructive action; if at that time, your delegate is out on the streets with his wife, or some other man's wife, window-shopping, attending a movie, enjoying a ball game, or looking after some personal business; and the important business above referred to wins or loses by one vote; the fault lies not so much with the House of Delegates as it does with the subordinate organization for sending such a representative to the House of Delegates. Assuming that a dozen or more subordinate organizations are thus derelict in their duties, and such an assumption is not wholly without historic record, you can readily visualize what, in time, might happen to our organization."

Concerning local conferences, Dr. Ecker says: "The perplexities confronting organized medicine are both local and general. Small groups of component societies have received much benefit from a timely discussion of local problems, the mapping out of constructive programs and the discussion of state and national issues.

"Another important function of group meetings is that they acquaint a ~~space~~ individual with conditions outside his ~~particular~~ locality, giving him a broader and more comprehensive view of organized medicine and its duties, not only to its individual members, but to the people whom it serves. The personal friendships which develop in these meetings are one of the most beneficial results. To come in personal touch with each other, to listen to the personal perplexities which are never put on paper, to ask questions, to offer suggestions, to correct errors, all combine to make us more tolerant, more sympathetic and more consecrated to exalted duty."

The inaugural address was read before the State Society while Dr. Ecker was in a hospital where he died within a day after his induction into the presidency.

CONVICTIONS FOR ILLEGAL PRACTICE IN NEW JERSEY

The June number of the *Journal of the Medical Society of New Jersey* contains a list of eighteen persons convicted of the illegal practice of medicine during the first three months of the year 1932. The list is as follows:

Doctors of Medicine	2
Manufacturer of a Quack Remedy	1
Bonesetter	1
Naturopath	1
Midwife	2
Electrotherapist	4
Chiropractors (exceeding license, especially in giving electrical treatments) ..	4
Druggist	2
Plain Quack	1

Special Summer Prices

Our usual SUMMER PRICES will be in effect from July 1st to August 15th.

A material saving can be made on all tablet and liquid preparations.

CLASSIFIED ADVERTISEMENTS

Classified ads are payable in advance. To avoid delay in publishing, remit with order. Price for 40 words or less, 1 insertion, \$1.50; three cents each for additional words.

WANTED: Salaried Appointments everywhere for Class A physicians. Let us put you in touch with investigated candidates for your opening. No charge to employers. Established 1896. Aznoe Service is National, Superior. 30 North Michigan, Chicago.

SANITARIUMS—FOR SALE

We have a number fully equipped, some partially so, and properties that can be made suitable; New York, New Jersey, Connecticut. Send for list and give number of rooms wanted for patients (approximately), also location desired. Address Swift Realty Co., 196 Market Street, Newark, N. J.

FOR SALE—226 East 79th Street. Completely equipped modern Doctor's Office, X-Ray, Fluoroscope, Diathermy machines, etc. Also Hanovia Alpine Lamp. Excellent opportunity to acquire long established practice of recently deceased physician. Address Box 26, care N. Y. State Journal of Medicine.

A man and wife, both graduates in the Swedish System of Massage and Medical Gymnastics, desire employment, either together or individually. Experienced also in high colonic irrigation. Willing to go anywhere. Address, Alfred Nordstrom, 75 Sherwood Place, Greenwich, Conn. Telephone 1775.

PHYSICIAN—Desires a responsible position in Sanitarium specializing in mental diseases. Also experienced with the treatment for alcohol and drug addiction. Excellent references. Address, Responsible, Box 27, care N. Y. State Journal of Medicine.

COCOMALT

Cocomalt contains not less than 30 Steenbock (300 ADMA) Units of Sunshine Vitamin D per ounce and is licensed by the Wisconsin Alumni Research Foundation under Steenbock Patent No. 1,680,818. Cocomalt is an appropriate vehicle for Vitamin D because Cocomalt carries along with Vitamin D a large supply of organic mineral salts which are biologically favorable in their proportion of calcium and phosphorus.

Cocomalt is highly recommended for children, adults, expectant and nursing mothers and convalescents.—See page xii.—Adv.

PHYSICIANS WHO PLAY GOLF

Know There's a Club for Every Stroke

Almost any player can swing around the course with a single club, dubbing drives, lifting fairway sods and bringing home a century mark or more for the final score. But the finished golfer needs a club for every shot—a studied judgment of approach or putt before the club is selected.

Similarly in artificial infant feeding. For the normal infant, you prefer cow's milk dilutions. For the athreptic or vomiting baby, you choose lactic acid milk. When there is diarrhea or marasmus, you decide upon protein milk.

In certain other situations, your judgment is evaporated milk.

Doxtri-Maltose is the carbohydrate of choice for balancing all of the above "strokes" or formulae and aptly may be compared with the nice balance offered the experienced player, by matched clubs.

To each type of formula (be it fresh cow's milk, lactic acid milk, protein milk, evaporated or powdered milk), Dextri-Maltose figuratively and literally supplies the nicely matched balance that gets results.—Page xi.—Adv.

ANTIPHLOGISTINE

The summer vacation exodus is in full swing and thousands are flocking to country and seaside in search of relaxation and pleasure.

Many vacations, however, are doomed to end unhappily through illness and accident, and physicians will be called upon to at innumerable traumatic injuries on the muscles, tendon sheaths, bursae and synovial structures about the joints: sprains, abrasions, lacerations, dermal burns, and by poisoning and burn, etc.

In addition to its antiseptic, analgesic, anesthetic qualities, Antiphlogistine between the flow of blood to the part of the absorption of infiltrations, exudates and adhesions.

Physicians are invited to write for sample and literature. See page ii.—Adv.

The VEIL MATERNITY HOSPITAL

WEST CHESTER, PENNA.

Strictly Private. Absolutely Ethical. Patients accepted at any time during gestation. Open to Regular Practitioners. Early entrance advisable

For Care and Protection of a BETTER CLASS UNFORTUNATE YOUNG WOMEN

Adoption of babies when arranged for. Rates reasonable. Located on the Interurban and Penna. R. R. and the Lincoln Highway. Twenty miles southwest of Philadelphia.

ORBITAL INFECTIONS

By ARNOLD KNAPP, M.D., NEW YORK, N. Y.

IN CONSIDERING orbital infections, it is important to speak, first of all, of the *orbital septum*. This is a thin membrane, which can be regarded as the continuation of the orbital periosteum, extending from the entire orbital margin towards but not reaching the palpebral opening. (Whitnall's Anatomy of the Human Orbit, p. 131.) It is the deep fascia which lines the palpebral part of the orbicularis muscle and covers the space between the globe and the orbital margin. It can form a barrier to the passage of extravasations from the orbit to the lids and vice versa. It descends behind the area of the lacrymal sac which therefore lies outside the orbit. The lacrymal gland is posterior to the orbital septum but is shut off from the orbit by the expansion of the levator aponeurosis; the weakest area of the lacrymal gland region is below in the direction of the conjunctival sac and it is here that infections of the lacrymal gland usually perforate. The septum is perforated by the vessels and nerves passing at its periphery, to and from the orbital margin. The nerves are the supratrochlear and supraorbital and the vessels are anastomoses between the ophthalmic and angular veins.

Inflammatory processes of the brow or eyelids, of the lacrymal gland or sac are generally not severe, as they remain external, and do not invade the orbit.

At the margin of the orbit in and below the brow, infections that resemble carbuncles are sometimes encountered. These are deeply seated purulent necrotic areas next to the periosteum, which frequently burrow laterally. A broad incision with excision of the necrotic tissue leads to prompt recovery. These do not involve the orbit and do not resemble the severe phlebitis-forming infections which are so dreaded by surgeons. The latter, the staphylococcal sepsis cases occur after furuncles situated in the middle line of the face, in the upper lip, along the lateral wall of the nose, or in the region of the eyelids.

In these there is a tendency to infectious thrombo-phlebitis of the facial vein and of the ophthalmic vein, which readily extends to the cavernous sinus. In some cases the infection does not invade the veins, but extends by lymphatic extension to the orbit and then to the meninges. In all of these cases numerous metastases occur in the internal organs especially in the lungs and kidneys (Lenhartz, Die Septischen Erkrankungen, p. 263, Vienna, Holder, 1903).

Infections at the *margin* of the orbit are generally caused by an injury, or by an extension from the inflammatory process in the neighborhood (tear-sac, periosteum of the upper jaw). This periostitis of the orbital margin resembles a periostitis found in other parts of the body. The diagnosis is usually easy. There is very little change in the position of the eyeball, the lids and the conjunctiva become red and swollen, a circumscribed tender, more or less firm, swelling develops, accompanied by pain, and is dark red in color. The swelling softens and perforates the skin, allowing some thin, fluid pus to escape. The swelling then gradually subsides, but it is a long time before the tissues return to normal. A fistula may develop which leads to exposed bone. Sometimes, in addition to the circumscribed periostitis at the orbital margin, a lid abscess develops. The inflammation may extend from the margin of the orbit to the deeper parts of the retrobulbar tissues. This is always a serious complication and depends upon the nature of the infectious organism and the primary localization of the process. Sometimes the reverse occurs in which a subperiosteal abscess secondarily involves the periosteum at the margin of the orbit.

A periosteal swelling may develop at the orbital margin whose exact diagnosis is not always apparent. A sinus infection may be simulated, but involvement of the lacrymal gland is a possibility as the following case shows: *M. A.*, aged 30. Two weeks after ton-

sillitis right upper lid became swollen and red. There was a swelling along the entire upper wall. X-ray showed frontal sinus to be clear. The swelling gradually became localized to the region of the lacrymal gland, and this abscess perforated through the conjunctiva with prompt recovery. This shows that an acute dacryoadenitis may develop after a tonsillar infection.

It is customary to speak of inflammation of the orbital walls and their lining periosteum and inflammation of the orbital contents. The former is called *orbital periostitis*, the latter, *orbital cellulitis* including abscess and thrombo-phlebitis.

Chronic periostitis of the orbit may be due to tuberculosis or syphilis. The *tuberculous* periostitides which I have seen, usually affect children, especially among the colored race. It is localized to the lower and outer orbital margin with involvement of the adjoining face. A "cold" abscess is present, and at operation necrosis of the bone is encountered. The recovery is necessarily slow with frequent resulting deformity of the lower lid.

The *syphilitic* variety is unusual and then involves generally the upper orbital margin together with other parts of the skull. It may affect any of the orbital walls and thus the condition is often obscure. A case in point was *Mrs. H. D. A.*, aged 47, who was seen on Sept. 16, 1926, with a history of five weeks, sore throat, pain on moving right eye for two weeks, with loss of sight. The pupil, 4 mm. wide, was immobile. Neuritic optic atrophy (hemorrhage below). Exophthalmometer, right 20, left 18. Pressure painful. Blood negative. Teeth negative. Sinuses were found normal. Pain at night with more protrusion and chemosis conjunctivæ. Weakness of superior and external recti. The treatment consisted in hot compresses, sodium salicylates, mercurial inunctions and calomel internally. Gradual improvement. Some sight returned in right eye. Pupil remained immobile. On December 13th, general health much improved. Right 5/200. Field defect above oblique line from above and out down and in. Pupil reacts. Retinal arteries narrow just beyond disc. April, 1927, 8/200, pupil 5½ mm. Has gained 10 lbs. Motility seems normal. July 21st, R. 8/200. F. normal. Pupil immobile, arteries irregular, glistening spots. Oct. 25th, R. 12/200. Jan. 31st, 1929, R. 10/200. F. normal. Retinal arteries very narrow. L. —0.50cV, 20/20.

Acute periostitis is now regarded as always secondary to a sinus affection, the intervening bone being first affected. The orbital periosteum is readily lifted up and a subperiosteal abscess develops which may extend either forward or backward. The intact periorbita furnishes usually an excellent protection to the orbital structure.

The symptoms of an orbital periostitis are often severe, especially at night, with pain in the

region of the eyebrow, vomiting, swelling and reddening of the lids and conjunctiva. These symptoms, together with their rapid development, usually easily distinguish a periostitis from an orbital tumor. The eyeball is displaced, it is pushed forward or in the direction away from the infected area and its motility is restricted. In periostitis the presence of a circumscribed tender area in the orbital wall is a very important symptom. The position of the tender area often shows which sinus is the starting point. Thus pain and swelling at the upper margin suggest an inflammation of the frontal sinus. In ethmoidal empyema the orbital complications occur at the inner wall above the lacrymal fossa. If left to itself the abscess perforates the skin and may thus slowly get well.

Though orbital periostitis and ostitis are generally due to inflammations of the accessory sinuses, it is well to remember that at the time when the orbital periostitis is predominant the nasal accessory empyema may be quieting down or have healed. In every affection of the orbit it need hardly be emphasized that the sinuses must be carefully examined.

While traumatic periostitis of the orbit is particularly prevalent in childhood, the second and third decade are more frequently involved in nasal sinus periostitis. A periostitis of the orbital wall is always a serious condition, both as regards life and the eye.

A periosteal swelling at upper or inner wall is usually associated with a perforation of the adjoining sinus. It may remain localized or extend forward to the orbital margin where it spontaneously perforates the skin and the acute symptoms subside, a fistula remaining which leads down to the affected sinus. It may extend back and invade the structures at the apex of the orbit, the most important one of these is an infection of the optic nerve.

At *operation*, which must be done early to avoid invasion of the orbit, the periosteum is detached from the orbital wall affected and a subperiosteal collection of pus is encountered and a defect in the bony wall of the affected sinus exposed. The subperiosteal abscess is evacuated, the defect in the bone enlarged and the cavity curetted with provision for proper drainage into the nose.

Periostitis of the floor of the orbit is unusual. The following is an example: *Mrs. B. B.*, 29 years old. Influenza, three weeks ago. Left eye protruded one week later. Left ptosis. Eye is pushed forward and up. Immobile. Conjunctiva very red. Lids normal. Pupil moderately dilated, o. d. normal. Vision 20/70. Along the entire orbital floor there was a uniform thickening. Examination of the nose revealed pus in left middle meatus. The antrum was washed out and contained pus. Point of greatest tenderness

was just external to the lacrimal sac. At operation an incision was made along the lower orbital margin, and the periosteum was retracted from the underlying bone. At about 2 cm posterior to the margin a hole was found in the bone, which led into a cavity situated partly in the floor and in the adjoining inner wall. Some granulations were removed. There was no free pus. Wound left open, tube inserted. Opening into the antrum from the nose was enlarged. Considerable purulent discharge through the tube. Irrigating the antrum, or blowing nose caused a discharge externally. Swelling of the eye distinctly less. Secretion from the tube gradually diminished. The swelling of the lids and exophthalmos rapidly came down, though the inferior rectus remained weak, for some time. Ultimate complete recovery.

Orbital periostitis is sometimes secondary to or associated with a tumor as is seen in the two following cases.

C. D. M., 39 years. In October, 1923, headache and failure of vision in right eye. The nasal sinuses were found affected in 1923 and were operated on. Wassermann negative. R 10/200 large paracentral scotoma. Right eye diverges and is displaced slightly up. Spasmodic retraction of lower lid. Eye immobile except downward. Pupil 3 mm immobile. Vision normal. Exophthalmos, right 22, left 20. O. d. blurred, +3 D. elevation. Fullness of floor of orbit on palpation. The x-ray showed a clouding of the orbital walls and a mass obstructing and erasing the sphenoidal fissure. The posterior nasal sinuses were explored. Scrapings from sphenoid bled very freely. These were examined and pronounced adeno carcinoma.

J. G., 49 years of age, was seen on September 30, 1929. There had been pain in the left orbit for eight months with diplopia. L 20/20. Field and interior were normal. Exophthalmometer, left 22, right 18. There was a mass below left caruncle. The x-ray suggests a tumor of ethmoid. The patient died two months later. The autopsy read as follows: A large, foul-smelling subdural abscess covers the major portion of the left cerebral hemisphere. By contiguous pressure the hemisphere had been thrust inward and to the right. No gross pathological changes were apparent within the brain substance. The region of the ethmoid and sphenoid sinuses were completely occupied and invaded by neoplastic tissue which protruded as sharply delineated nodules upon the intracranial surface of the body of the sphenoid bone. The observed abscess was therefore probably due to contiguous extension of the coincident intracranial infective status. The removed portion of the neoplastic tissue presented grossly a whitish appearance and of rather dense consistency which, however, was partially mitigated by necrobiosis.

In treatment we are confronted with a number of important questions. We must first decide—where did the inflammation originate, and is a sinus inflammation present or not? This requires a thorough examination of the nose including x-ray, and a complete history with study of all the symptoms. The mouth must be searched for carious teeth and periostitis, the pharynx must be examined, and a general examination made. The second question is—has the inflammation of the bony wall led to a subperiosteal abscess in the orbit? If this can be diagnosed, an early operation is indicated to prevent extension and involvement of the retro ocular tissues. If the diagnosis cannot be made, we may wait until the abscess extends to an accessible part of the orbital margin. We would thus incur the danger of an orbital abscess and a brain complication. An exploratory operation should best be done, especially if the roof of the orbit is affected, displacing the eyeball downward. Birch-Hirschfeld (Graefe Saemisch, II ed., vol IX, part 13, p. 277) condemns the usually recommended exploratory incision or puncture for the following reasons: If we realize the shape of the bony orbit, it is apparent that an incision can hardly be made without opening the periorbita and infecting the retrobulbar tissue. The incision, furthermore, will hardly find a collection of pus, drainage will be insufficient and probably dangerous. I agree with Birch-Hirschfeld that it is much better to make an incision along the orbital margin and then to detach the periosteum, and this is the procedure which I always follow. A subperiosteal abscess if present, can then be readily evacuated and drained. The retrobulbar tissue is preserved and opportunity is offered to inspect carefully the bony wall. If the process extends to the retrobulbar tissue, and an abscess develops, the periorbita can then be more readily exposed and incised after detachment of the periosteum. If the abscess points at the margin of the orbit, it can be opened through the skin, and sufficient drainage is obtained.

Inflammation of the retrobulbar tissue occurs in orbital abscess, cellulitis of the orbit, or orbital thrombophlebitis. These are not different conditions, but in one case there is a large accumulation of pus, while in another case there are multiple abscesses, and finally there is a group with a particular involvement of the veins. The condition is generally acute, with severe general symptoms, such as headache in the forehead fever, etc. The most important local symptoms are the marked edema of the lids and of the conjunctiva (chemosis) and protrusion of the eyeball. This protrusion is straight forward unless the preceding periostitis is pronounced enough to cause lateral displacement. The suddenness of these symptoms, together with their inflammatory nature, distinguish this condition from an

orbital tumor or a retrobulbar hemorrhage. In panophthalmitis there are inflammatory symptoms of the eyeball itself. Periostitis of the orbit usually affects only a definite part of the orbital wall, and while there is swelling of the lids and of the conjunctiva, the protruding eyeball is displaced to one side with less interference with its motility. The one-sided occurrence of the disease, the absence of severe cerebral symptoms, and of edema over the mastoid distinguish it from cavernous sinus thrombosis. In tenonitis the chemosis is usually pronounced while the protrusion of the eye is slight. The diagnosis is often difficult and it is not always possible to distinguish between periostitis and abscess and a combination may be present.

The *causes* of orbital cellulitis are—First, when the orbit is directly infected by injuries, by foreign bodies, or by operation; second, extension from the neighboring structures; third, metastatic. Of the foreign bodies which have perforated and remained in the orbit splinters of wood are particularly frequent. There may be a slight injury of the lid which is followed by erysipelas and an orbital abscess. Inflammation has followed some operations, such as removal of an orbital cyst, tenotomies, evisceration and particularly operation on the lacrymal sac. Operations on the nose and especially extractions of teeth have been followed by serious orbital suppurations. The second group, i.e., extension from the neighboring structures, is a larger one. Here we distinguish between an inflammation of the orbit following panophthalmitis, and orbital abscess following purulent dacryocystitis, and, finally, an orbital abscess after purulent inflammation of the nasal accessory cavities. That the last is a frequent cause has been previously emphasized. At the same time, the usual orbital complication of a sinusitis is periostitis which, however, may, sooner or later, give rise to cellulitis of the orbit. An important group are the inflammations which start as thrombo-phlebitis of the facial veins after a primary infection of the lids, of the eyebrow, of the lip, and the nose. There are deeply situated vessels which anastomose with the orbital veins, such as the vessels of the superior maxilla, of the mouth, the tonsils, and the pharynx, which may be the starting point of a purulent process and lead to an orbital abscess. Leber has drawn attention to the importance of erysipelas starting in these regions where the primary infection is of short duration and causes but few symptoms. The final group (metastatic inflammations), is indefinite. If the infection is located in places where there are direct veins connecting with the orbit, a progressive thrombo-phlebitis is the pathological process. This holds true for parotitis, tonsillitis, and for erysipelas of the face. On the other hand, influenza, scarlet fever, and diphtheria can cause an orbital complication through the in-

termediary of a sinus disease. Large accumulations of pus within the periorbital area are not as frequent as multiple small abscesses which are usually located in the neighborhood of the vessels. The tendency of an inflammation in this location to diffusely infiltrate or to cause small abscesses is probably due to the anatomic structure of the orbital fat tissues. The process extends rapidly to involve all of the retrobulbar tissues, displacing and immobilizing the eyeball in the line of the axis. Complications on the part of the eye and of the brain may then occur.

As for ocular complications, exposure from exophthalmos, rigidity of the lids and stagnation of circulation, cause ulceration of the cornea, which may go on to corneal abscess, slough of cornea, or panophthalmitis. The eye may be affected though the cornea is intact. The changes in the eyeground vary: the fundus may appear normal, optic neuritis, retinal hemorrhages, or closure of the retinal vessels have all been noted. Blindness may come on suddenly, or failure of sight is gradual. Panophthalmitis and atrophy of the eyeball are not infrequent. Birch-Hirschfeld found in 275 cases transient visual disturbances in 39 and blindness in 52.

The most serious complication of course is an *involvement* of the *brain*. Birch-Hirschfeld (l. c.) found that death occurred in 47 of 275 cases, resulting generally from meningitis or brain abscess (30) and sometimes from thrombosis of the cavernous sinus (8). The brain complications were evidenced by rigidity of the neck, vomiting, delirium, coma, disturbance of speech, and paralysis of the extremities and of the face. In purulent cavernous sinus-thrombosis the involvement of the other orbit is notable. A comparatively unusual complication of a retrobulbar inflammation consists in abscesses of the temporal and parotid regions, presumably due to a phlebitis of the inferior ophthalmic vein which communicates with the pterygoid plexus. The brain may be involved by perforation of the bony wall of the orbit though this is generally the result of a periostitis or subperiosteal abscess. In general the veins serve as the means of transmitting the infection to the brain. Bilateral abscesses of the orbit are unusual. They occur generally through the intermediary of the cavernous sinus.

The *treatment* of orbital abscess is more difficult than that of subperiosteal abscess, as the orbital tissues are infiltrated with purulent foci. If a large abscess develops and points externally in the lids an incision is naturally the correct treatment.

Orbital infections occur not infrequently in very young children, and the following is the report of an orbital abscess occurring in a child of eight weeks. After a cold with considerable discharge from nose, the left eye became swollen. The swelling became localized to the lower lid

which was indurated and brawny. Marked exophthalmos. The eye was pushed upward and outward. There was a dense resisting mass palpable within the lower orbital margin. The region of the sac seemed normal. Eyeground was normal. An incision was made along the lower orbital margin. The orbital septum was dense. On cutting through this, discharge of pus, exposing a cavity which extended in a straight line back for over an inch. There were no pockets nor induration about the walls and there was nowhere exposed bone to be felt. The external wound was enlarged and a cigarette drain introduced. The acute symptoms gradually disappeared, the discharge lessened, in one week the eye condition was much improved. Recovery uneventful.

When the abscess does not point externally treatment is difficult. Conservative measures do not help much, and on account of the objections to exploratory deep incisions into the orbit which have been previously stated the decision to operate becomes difficult. If the lids are very tense and the cornea suffers from exposure, I would recommend a curvilinear cutaneous incision along the temporal orbital margin with division of the external canthal ligament. This is a procedure to relax the eyelids which is of value in extreme proptosis. Birch-Hirschfeld (1. c.) states that while it is difficult to arrive at any definite conclusion on the advantages of treatment from statistics, it nevertheless seems that the prognosis for the preservation of life is better in early incision in orbital abscess than in conservative treatment, while early incision has not influenced the fate of the eyeball.

When operation is imperative rather than blind deep incisions Birch-Hirschfeld thinks that it would do better to first expose the margin of the orbit, detaching the periorbital, and then to open the orbit; occasionally the Krönlein method has given good results. Some of these cases fortunately recover without the help of the ophthalmic surgeon. This favorable result depends on the kind of infection and not on our therapeutic mea-

sures. This author furthermore states that the removal of an eye with panophthalmitis has been performed in the presence of an orbital cellulitis with favorable influence on the orbital inflammation. The operation, however, is not permissible unless the eyeball is so damaged as to require removal, and it must not be forgotten that enucleation in the presence of an orbital abscess may be an added danger.

Infections of the orbit which occur from *penetrating injuries* with retention of a foreign body often present difficulties in treatment. In the following case, a piece of wood had been retained in the orbit for nine years.

J. M., aged 17 years, came on account of drooping of the lid and occasional pain in the left orbit. Otherwise there was no change. A year ago a lump appeared in the old cicatrix which discharged pus. Three days later the lid again became swollen. Exophthalmometer right 18, left 22. Pain on moving eye. Motility restricted upward. Upper lid swollen and red. There was a resistance to be felt within the upper orbital margin. R. 20/15, L. 20/20. A probe was cautiously introduced and at about 1" it came up against some firm substance, without setting free any discharge. At operation a curved incision was made along the upper and inner margin of the orbit. With difficulty the periosteum was separated above and nasally, and at 1½" back a discolored area was exposed in the periorbital. This was incised and a small spicule of wood removed. Directly posterior to this area an irregular exostosis in the upper bony wall had formed, which was removed. The discolored area in the periosteum was enlarged and a purulent collection evacuated together with three additional pieces of wood. The fistulous tract was then opened up, the edges trimmed off, and the tract curetted. As no further resistance could be felt in the depth of the orbit, a rubber tissue drain was introduced and the external wound was partly closed with sutures. Gradual recovery.

This case shows the advantage of the subperiosteal approach in orbital conditions.

TWO ESOPHAGEAL CASES

By J. V. BOHRER, M.D., NEW YORK, N. Y.

Cases shown before the Surgical Section of the New York Academy of Medicine, December 4, 1931

CASE 1. DIVERTICULUM

AMAN, aged sixty-nine, a clerk by occupation, was admitted to Knickerbocker Hospital May 13, 1931. Two years previous to his admission, he began to experience difficulty in swallowing. The first symptom he noticed was disturbance in swallowing certain types of food. Liquids and semi-solids were most annoy-

ing; the second swallow would be regurgitated and cause vomiting. At other times the food that he had taken the meal before would be regurgitated. This at times would be mal-odorous. He had a feeling of fullness in the region of the diverticulum and also a gurgling sensation. He lost weight on account of lack of food. It became so difficult to swallow that he would not

eat in public and ate very little in private. At the time of admission he was in poor nutrition, weak and dehydrated. It was essential to improve his condition before operation. He was encouraged to take food and was given water by rectum and glucose by venoclysis. He irrigated his diverticulum with water after eating.

An operation was done on May 17, 1931, under light colonic anæsthetic. The diverticulum was about three inches long and about three inches wide. It lay in the pre-vertebral space behind and to the left of the trachea and extended down to the level of the clavicle. The sac was easily identified, grasped with an Allis clamp and dissected free by blunt dissection. The lower, acute angle was dissected well up to the neck of the sac, in order to allow the diverticulum to be placed in a reverse position; thus placing the blind end of the sac at a higher level than the opening into the esophagus. The sac was then sutured in the wound holding it in the above-mentioned position. This prevented food from entering the sac during the act of deglutition. Twenty-four hours later he was able to swallow liquids with little difficulty and without regurgitation. During the latter part of his ten-day interval between stages, he was up and about the ward and was able to swallow all types of food. He gained in weight and strength, in fact, judged from his ability to swallow, a second-stage operation was not necessary.

May 27, 1931, the second stage was done under local anæsthesia. The fundus of the diverticulum was clipped off and the mucosa dissected down to 1 cm. of the opening in the esophagus, leaving the submucosa in place. This tract was packed with vaseline gauze, which coapted the cut edge of the remaining mucosa. For four days there was slight leaking when the patient swallowed liquids. He was completely healed at the end of ten days.

He has been able to swallow perfectly since the completed operation, has regained his normal weight and is entirely well.

On two occasions since operation, I have passed an olive-tipped bougie, on swallowed silk thread as a guide for the dilator. A 15 cm. dilator passed readily. X-ray and fluoroscopic examination made December 28, 1931, showed a slight retention of barium at the site of the former diverticulum. This did not give the patient a feeling of retention. I do not believe this retention is due to a residual diverticulum, but to a distortion of the esophagus at the site of the scar.

Certainly a two-stage operation in these debilitated, elderly people is a safe, satisfactory and adequate operation. Undoubtedly a one-stage resection gives a better anatomical result, but in the hands of the general surgeon, certainly is not as safe an operation.

In a communication from Dr. Lahey, he states:

"I do not believe it is possible with any type of operation for esophageal diverticulum not to get esophageal distortion as the result of the scar. I presume that the two-stage operation gives a little more distortion than the one, on the other hand, it is so safe and the results have been so excellent in our hands—we have now operated on thirty-seven or thirty-eight of them without a mortality—that I feel not at all disturbed by the little projecting aperture on the back wall where the neck of the sac is excised.

"We have had no recurrences, but on the other hand, we have dilated them with olive-tipped bougies on swallowed silk thread for at least a year postoperatively."

Moynihan, under correspondence in *Surgery, Gynecology and Obstetrics*, Vol. LIV, No. 1, Jan., 1932, states:

"I write not solely to call attention to the facts mentioned, but to encourage my American friends to perform the operation of resection of these pharyngeal pouches in one stage. If a surgeon is competent and has a perfect technique there is really no need whatever for operations in two stages. I have operated upon 15 cases (1 on the right side) and have never had any difficulty in obtaining healing by first intention."

CASE 2. CONGENITAL TRACHEO-ÆSOPHAGEAL FISTULA

Baby P. was born in Bellevue Hospital November 9, 1931, at full term, and died November 25, 1931. It showed a normal development in all outward appearances. It passed meconium. Its circulatory system was apparently normal.

When the baby nursed, it was observed that after a few minutes it would stop and immediately regurgitate what it had swallowed and then resume nursing. The regurgitated material was unchanged milk. It contained no curds and was alkaline in reaction. The baby lost weight rapidly, and glucose and water were given hypodermically to maintain nutrition.

When fourteen days old, it was transferred to the surgical ward. An attempt was made to pass a catheter into the stomach. It could be passed only 12 cm. from the alveolar edge. Lipiodol was then injected and an x-ray examination was made. It revealed the esophagus to end in a dilated pouch. Under local anæsthetic, a laparotomy was done. The stomach, although it had received no food, was dilated and contained air. A gastrostomy was done and 10 c.c. of sterile water injected before the wound was closed. The baby immediately coughed, choked and became very cyanosed. A small amount of milk was given through the gastrostomy tube twelve hours later, only to cause a repetition of symptoms.

It was quite apparent that we were dealing with a fistula which communicated with the bronchial tree.

A barium mixture was then introduced into the stomach and an immediate x-ray picture taken of the abdomen and chest. This revealed the stomach portion of the esophagus joining the trachea at about the level of the bifurcation. The baby died twenty-four hours later. A partial protocol of the post mortem follows:

The thoracic and abdominal contents are examined from the posterior aspect after having been previously hardened and after the areolar tissues have been carefully dissected away. The following anomalies are found to exist in the first place, the esophagus is divisible into two portions which are entirely separate and distinct. The first is an upper portion which is rather tubular with a sacular end. This lower end is entirely closed and terminates at the level of the bifurcation of the trachea. From the dilated closed end there comes forth a slender strand of fibrous tissue which blends with the peri-aortic areolar tissues. This rather separate and distinct upper portion of the esophagus does not communicate in any way with the trachea and its mucosa appears entirely normal. The lower portion of the esophagus comprises the inferior two-thirds and commences at the bifurcation of the trachea and terminates in the cardiac opening of the stomach. It takes origin on the posterior surface of the trachea at its bifurcation and continues extending into the cardiac opening of the stomach as described. The origin then comprises a tracheo esophageal fistula and except for a very slight curvature where the esophagus blends with

the bifurcation of the trachea, the two structures might well be considered as a continuous straight tube. Thus, when a probe is passed through the gastrostomy, it passes through the cardiac opening of the stomach up the inferior portion of the esophagus, out through the trachea and emerges from the larynx. A careful search of the body viscera fails to reveal any other congenital anomalies.

A ductus arteriosus is obliterated and the bladder and rectum terminate through a distinct opening.

The heart is a four chambered organ without any septal defects. The various solid and hollow viscera show no gross pathological change and are apparently normal. The diagnosis was congenital anomaly of the digestive tract, atresia of esophagus, congenital tracheo esophageal fistula.

This proved to be one of the most common types of congenital malformation, viz., where the upper portion of the esophagus ends in a dilated blind pouch, having no connection with the stomach portion, the latter connecting directly with the trachea.

For complete discussion of the various types of congenital malformations of the esophagus the reader is referred to two recent publications. First a report by Rosenthal, "Congenital Atresia of the Esophagus with tracheo esophageal fistula", *Archives of Path.*, Vol. XII, p. 756-772. Second, C. C. Beatty, "Congenital Stenosis of the Esophagus," *British Journal of Children's Diseases*, Vol. 25, 1928, p. 237-270.

INDICATIONS AND CONTRAINDICATIONS FOR PHYSICAL THERAPY IN TRAUMATIC CONDITIONS

By WILLIAM V. HEALEY, M.D., NEW YORK, N. Y.

Read as part of a course on Physical Therapy in Traumatic Conditions arranged by the Committee on Public Health and Medical Education of the Medical Society of the State of New York for the Medical Societies of the Counties of New York and The Bronx.

THE huge increase in the number of physical therapy treatments administered in the physical therapy departments of most hospitals today testifies to the enlargement of the scope to which physical means are being used to alleviate the results of trauma. The usefulness to which these means are employed varies largely in individual clinics so that we see the same type of trauma treated in entirely different ways in different institutions. The physical therapy treatments accorded to patients in doctors' offices is administered upon the experience that the individual doctors have gained from hospital and private experience. There is scarcely any institution today, of any size, which is not equipped with some department of physical therapy and the differences in the treatment accorded vary so much in individual hands that it is well for us to look into and have some generally accepted funda-

mental ideas on the indications and contraindications of this form of therapy. The demand for such service is very great.

The impetus given to treatment by physical means during the past twenty years has been due to the appreciation by a larger group of medical men of the value of this type of treatment. Prior to that time a relatively small group of men appreciated the value of physical means in the treatment of injuries and disease, but many of the modalities used were employed empirically. Today those interested in the work are seeking the scientific employment of physical means and to this end we must attempt to justify the employment of these means by a careful review of what may and may not be expected of physical therapy.

It is not and can never be a cure all, and the employment of such means in a purely empirical way, like the old gunshot prescription, can result

only in placing physical therapy in disrepute. No one who will look upon the subject objectively can fail to see the value of properly employed physical therapy. In all things medical we must begin with the patient and before we can institute any means for treatment, we must make a definite diagnosis and have some understanding as to the pathology present. Upon this assumption we can then predicate the possible value of one or another means of treatment, provided we know what such treatment can in itself accomplish.

The physician who assumes the responsibility of administering physical therapeutics without knowing what can be expected of the various modalities and without a definite appreciation of the pathological condition present places himself on a level with those of the laity who, believing that apparatus is all that is necessary to give such service, have so equipped themselves, and ignorantly administer treatment to themselves or others until the disappointment of ineffectual results terminates their practice. The State has foreseen this and has fortunately provided that licensed physiotherapists may administer treatment only on written prescriptions of licensed physicians. The State herein assumes that physicians appreciate the pathological conditions which are amenable to treatment by physical means, but the varied opinions as to the indications for such treatment and, more important, the contraindications, would tend to show that we are not all of the same mind regarding physical therapy.

In attempting to evaluate the benefits derived from any form of treatment we may approach the problem first, from the viewpoint of research, or secondly, from the viewpoint of clinical experience. Many attempts have been made to find out just what happens physiologically when the various modalities of physical therapeutics are used. Recently Harold Wolfson of Chicago attempted a study on the effect of physiotherapeutic procedures on function and structures in the normal limb of a dog. While a single study of this kind is not entirely conclusive, the author did show experimentally that heat produces increased blood supply due to the active dilatation of the blood vessels. Massage and motion, by mechanically emptying the blood vessels, caused temporary increase in the rate of flow. Electricity, as applied in this study, was ineffective in increasing the blood flow. The author properly states that the value of electrical treatment in poliomyelitis and peripheral nerve injuries may be due to some other effects not studied in these experiments. However, the point of the matter is that when we attempt to evaluate the possible benefits to be derived from physically administered therapeutics, we can approach the subject in a purely experimental way. Secondly, clinical experience shows us that clinical improvement follows the administration of certain physical

means when experimentally no scientific basis can be given. If we were to ask any physiotherapist as to the value of electrical stimulation to paralyzed muscles I have no doubt that all would agree that where the reflex arc is intact improvement will be seen, and yet just how this occurs will be explained by each in his own way, some believing that the improvement is due to actual muscle contraction itself, others that it improves the regenerative power of the nerve itself, while still others will argue that the improvement of nutrition and circulation aid in the lessening of waste products. From a clinical viewpoint it is not of essential importance just which of these explanations is correct but it is of importance that all are in agreement that electrical stimulation is of value in the clinical improvement expected in a given case. As the efficacy of all physical measures depends in the last analysis upon the physiological response of the body to applied measures, it is well to enumerate the classes or types of physical measures at our disposal and see what might be expected of them physiologically when applied to the body. Kovacs¹ has enumerated them as seen in the accompanying chart.

THERMIC

Hot water.	Relaxation of tissues.
Hot air	Hyperaemia
Radiant heaters	Relief of pain
Incandescent lamps	Attenuation or killing of germs
Sun	Reflex stimulation
Diathermy	

CALORIC

Cold water	Contraction of tissues.
	Anaemia

PHOTOCHEMICAL

Sun	Erythema of skin
Heated metals	Killing of germs
Carbon arc	Relief of pain
Mercury vapor arc	Increase of solid contents of blood

ELECTROCHEMICAL

Galvanic current and variations	Pos. pole vasoconstriction acid reaction vasodilatation
	Neg. pole alkaline reaction
	Interpolar—metabolic

DYNAMIC

Interrupted, wave, and alternating currents	Muscle and tissue contraction
Vibration	Increase of venous and lymph flow, stretching of tissues, reflex stimulation.
Massage	

All effects may be mild (stimulation) or exaggerated (destruction), local, general or reflex, according to the intensity, duration and area of application.

The effects of these physiologically may be mild, and, as such stimulative, or, with misuse, destructive in action. Burns, chronic passive congestion and necrosis may easily follow the injudicious use of heat or cold. Likewise, photochemical measures, inappropriately used, or continued over too long periods, may result in burns or definite anaemias and surely no one would call the electric chair a therapeutic measure and yet its action is identical with electrochemical measures employed by us but utilized in a destructive phase. The dynamic measures such as massage and alternating currents, so productive of benefit in producing muscle contraction, improvement in blood and lymph flow and possibly reflex stimulation, when injudiciously used result in congestion, increase of pain and temporary, if not permanent, paresis. The too early use of massage in peripheral nerve injuries clearly demonstrates this principle. Application of the physiological principles of function of the various modalities and an insight into their disturbing action by injudicious use must predicate all attempts at a formulation of the indications and contraindications of physiotherapeutic measures. It is not sufficient for those who are to be responsible for the proper application of these physical agents to be acquainted with these measures alone in endeavoring to relieve the pathological processes which are the result of trauma. Other physical principles must not only be known but must be used.

Few traumas occur that are not accompanied by hemorrhage of more or less degree in the soft tissues. When this occurs in the periphery of the body, as in an arm or leg, one cannot expect a return to normal by any kind of physiotherapeutic treatment if, during the interval between treatments, the part is constantly kept dependent. Whatever improvement might be gained by an hour of physiotherapeutic measures would surely be undone by the return of congestion, the result of dependency. So that it is of importance that the physical therapist appreciate the value of elevation of a traumatized part during the entire period of incapacity. I fully appreciate that if, during the period of incapacity, a limb is maintained elevated, the blood vessels will lose their ability to contract and relax as required, and that at whatever time the limb begins to become dependent there will be lymph and blood stasis. It is true that elevation can be overdone but, as I see it at the present time, it is not used sufficiently.

Vasomotor exercise, obtained by practicing elevation and dependency alternately, will frequently accomplish more than any other physical measure in the relief of lymph or blood stasis.

Again, the principles of splintage or braceage of any kind are truly a physical measure designed to make possible the satisfactory application of the appropriate therapeutic measure. To illustrate injuries to the musculo spiral nerve result in wrist drop. During the regenerative stage, lack of support to the wrist and fingers to maintain them in dorsiflexion is certain to result in over stretching of the extensor muscles so that in spite of any amount of electrical stimulation, they cannot regain their power. Failure on the part of the physiotherapist to take advantage of these physical measures is bound to result in failure in the regaining of function through physiotherapeutic means, when success might be had if proper splintage were taken advantage of. Foot drop, the result of failure to support relaxed muscles when, for some reason, they are unable to maintain their own tone, will certainly respond to physiotherapeutic measures more readily when, in the interval between treatments, the foot is maintained dorsiflexed by proper splintage.

The responsibility of the physician rendering physical therapy cannot be limited to the administration of the appropriate modalities of thermal, electrochemical or dynamic agencies alone. He must have an appreciation of other physical agents used outside his own specialty, as to how, when and why they are used, if he is to adequately benefit the patient. For too long has physical therapy been considered the work to be done after the surgeon has completed his work. This is unfortunate as it is soon after trauma that physiotherapeutic measures have their greatest opportunities. If we are ever to approach the ideal, the surgeon and physiotherapist must work conjointly and physical therapy must be instituted from the time of admission of the patient and cease when it is found that the patient can do for himself what the treatment is designed to help him perform. It is just as grievous to continue to indulge the patient in continued physiotherapeutic treatment when all that is required is his own activity as it is to neglect to give him the benefits to be derived from such treatment early in his illness.

Traumatic surgery presents an ever changing assortment of conditions requiring a versatility observed in no other branch of surgery. A simple fracture of both bones of the leg without displacement may be treated with simple immobilization permitting the use of early physical therapy and early function. How different must be the treatment accorded when the fragments are comminuted or when the wound is compounded. Just as the general surgical principles must be maintained in all of these varying types of injuries, while the treatment accorded in each will vary widely, so also must the physiotherapist adapt his physical measures to the individual case varying it to meet the requirements. In one case

it will be the relief of congestion, again the improvement in the muscle tone, while in a third it may be for the improvement in nutrition to the part. The armamentarium of the physical therapist must be sufficiently wide for him to use it effectively. The earlier after the injury physical measures can be instituted the more may certain conditions be prevented. In hospital work the admission of an accident case is attended usually by great scurrying upon the part of the house staff to attend to the wounds and broken bones, but it is rare to see anyone and, least likely of all, the physiotherapist, hurrying with a good sized radiant heat lamp which might be of incalculable value in combating the shock seen in many of these cases. And yet the patient may die of his shock while the probability of his demise from the fracture *per se* is, to say the least, remote. It is true that these cases are admitted on the surgical service and one might rightfully argue that it is up to the surgeon to see that these shock measures be instituted, but, if a physical therapy department is to function wisely, it must see its opportunities in all departments of the hospital and probably, by suggestion, be instrumental in lessening disability. Physical therapists should see to it that effective means are employed early in the treatment of the patient so that the result of early neglect will not result in conditions requiring prolongation or delay of appropriate physiotherapeutic measures. The cooperation of the physical therapist and the surgeon must be complete.

Specific traumatic conditions requiring the use of physiotherapeutic measures would indeed be a long list. For the purpose of discussion, we might segregate them in six groups: (1) Fractures and dislocations; (2) Infection and results of infection; (3) Burns; (4) Low back injuries; (5) Peripheral nerve injuries; (6) Sprains and strains.

Perhaps the largest group and certainly the one resulting most frequently in prolonged disability is composed of fractures. A fracture is too often considered a broken bone. It is true that when a fracture occurs the bone is broken, but it is likewise true that no fracture ever occurred, and certainly no fracture with displacement, without injury to parts other than the bone. The treatment of fractures has been frequently divided into the stages of reduction and the restoration of function in the adjacent joints. Physical therapy cannot be expected to overcome the consequences or the result of improper or incomplete reduction. If function is to be regained the best possible reduction must first be obtained. The physiotherapist should be interested in what has been accomplished in the way of reduction and I have no doubt may readily be of considerable help in suggesting ways and means of accomplishing this. Champenier demonstrated this when he accomplished reductions readily in elderly people with

sedative massage. While this principle cannot be generally applied, it does illustrate that the relief of muscle spasm by massage can, in the selected case, accomplish reduction of displaced fragments. Murray** has recently attempted to properly place physical therapy in the treatment of fractures. He looks for an appreciation of first, what treatment of the fracture *per se* intends to accomplish; secondly, what physical therapy can and cannot do and thirdly, the part played by the patient. He suggests for the first appropriate reduction and a minimum of immobilization permitting the early institution of heat in the form of the therapeutic lamp and diathermy. Massage, if used, should be of the light, stroking type as described by Mennell for its reflex effect. He uses muscular stimulation by slow rhythmic contraction, employing the Bristow coil or a sinusoidal surge. He stresses the point that after the bone lesion is healed the patient visits the physiotherapist for his treatment, usually fifteen or twenty minutes three times a week and waits for physical therapy to restore function to the part. He emphasized the importance of having the patient appreciate that the regaining of function is the patient's job and that physical therapy can help him to do his work but it cannot do it for him. Assuming that in a given fracture case reduction has been accomplished and appropriate physical therapy has been employed during the healing stages, the condition which most frequently continues the patient's disability is that of limitation of motion in the joints adjacent to the fracture. Immobilization does not cause ankylosis, either fibrous or osseous. Immobilization may be a contributing cause to ankylosis but if we will search for the pathology existing in the given case responsible for the limitation of motion, the solution of restoration of function will become more evident. The types of fractures which enter a joint result in extravasation of blood into the joint itself, as well as into the ligamentous and muscular structures surrounding the joint. In addition to this, the cartilage and bone having been divided, unite, with callous closing the bone and with fibrous tissue healing the cartilage. Cartilage does not replace itself as does bone. In this type of case appropriate physical measures to hasten the absorption of blood within the joint, such as elevation, heat, gentle massage and, at times, diathermy, lessen the possibility of ankylosis. Immobilization used at the same time, while these extravasated products are being absorbed, lessens the chance of ankylosis rather than promotes it.

The accomplishment of this is usually completed within the first two or three weeks at which time mobilization of the joint may be started for short periods during the day. When the fracture line does not enter the joint but is confined to the shaft of the bone, even near the joint, the only possible deterrent to activity is the

extravasated substances within the ligaments, tendon sheaths and muscles which, if permitted to organize, lengthen the period of disability by decreasing the contractility and elasticity of the muscle fibres and by increasing the irritability of the muscle itself.

Passive and active exercises are so frequently misused that I would like to take the liberty of recalling their use and misuse to you. Active motion is that type of exercise in which a joint is moved by the subjective contractions of the patient's own muscles. Passive joint movement varies from it in that the motion is carried out by someone else's muscles or by some mechanical device. If a patient flexes his elbow he contracts his biceps and, at the same time, unconsciously relaxes his triceps. Conversely, extension of the elbow is accomplished by contraction of the triceps and relaxation of the biceps. Following trauma about the elbow, and particularly if the joint has been immobilized without the means being taken to prevent the organization of extravasated products, changes occur in the biceps and triceps lessening their elasticity and extensibility. In the presence of this, active contraction of the biceps will result in a lessened range of motion in the joint itself but it will with certainty be accomplished by relaxation of the triceps up to the point of extensibility of this muscle when pain will be noticed and the patient will cease contracting the biceps further. In this state of lessened elasticity and extensibility the apprehension of the patient to pain will cause him to fear any attempt at passive movement and his apprehension will cause him to exert a protective spasm in both biceps and triceps at the same time. If the passive movement be continued it can only result in the stretching of a spastic muscle which means possibly minute but nevertheless definite hemorrhage in the muscle itself with consequent organization, fibrosis and further stiffness. If we are to accomplish anything in improving the range of motion in joints following fractures, we must cease to regard passive movement as a means of accomplishing this. I saw this well illustrated in a patient who had sustained a fracture of the internal condyle of the humerus not entering the joint. The fracture was reduced and the elbow maintained flexed with a posterior plaster splint. No early physiotherapy was instituted. At the end of four weeks the patient was ordered to have radiant heat, diathermy and passive motion. He received this daily for six months at the end of which time the elbow was held flexed at 100 degrees with about 10 degrees of active motion present. X-rays revealed no bony interference either within or without the joint but marked protective muscle spasm was present. It was suggested that the patient continue the use of heat and diathermy but that active exercise be substituted for passive movement. In a week the patient had 40 degrees of motion

and returned to work within a month with practically full motion.

Resistive movement, unlike passive movement, has a definite place in assisting the patient in regaining loss of motion in a joint. It is indicated where, through fear of hurting himself, a patient will not exert sufficient muscle contraction to improve his function. When we resist the flexion of an elbow, the biceps must work more powerfully and conversely the triceps must relax more thoroughly. We know that opposing muscle groups work interdependently. Having the patient contract his biceps against resistance and alternately contract the triceps against resistance will accomplish more in a short time in improving the range of motion in a joint than any amount of powerfully exerted passive movement. The reason for this, and here again we must go back to the fundamentals of the physiological property of muscle, is that every contraction of muscle must be followed by a phase of relaxation if we are to develop power in the muscle. The popularity of weight and pulley machines used some few years ago has largely waned for this reason. If we conceive of pulling against a weight for the development of the biceps, the weight dropping as the contraction in the biceps reaches its maximum, it follows that the biceps must maintain some contraction in order to permit the weight to fall. This means that the biceps are contracted both as the weight is pulled up and as it is let down. With this there is no phase of relaxation and therefore there cannot be any improvement expected in the strength of the muscle.

There is one exception to the use of passive movement which I would like to call to your attention. Following injuries to the forearm or hand it is not infrequent that stiffness results in the wrist and fingers. If these joints are stretched manually we have seen that further hemorrhage occurs resulting in further stiffness. However, if gradual traction is applied to the joints of the fingers and this traction be constant and always less than that which an active contraction of the tendon under traction can overcome, stretching will occur without actual hemorrhage. To illustrate, if elastic traction be applied to improve flexion in the fingers, the extensor tendons, joint capsules and soft tissues being shortened, the elastic traction should never be sufficiently strong to prevent an active contraction of the extensor tendon from straightening. With this amount of traction the constancy of the elastic pull will overcome gradually the shortening in the extensor tissue and further flexion will be accomplished without injury to the extensor tissue. This type of passive movement differs from the usual manually employed passive movement in that further insult to the shortened tissue is never provoked. Physical therapy employed with this type of passive movement will frequently accomplish the restoration of function when physical therapy

alone or traction alone would never result in improvement.

I believe that if we are to attempt indications and contraindications for physical therapy in fracture treatment, we must cease to consider the cases as fracture cases and consider them as cases of lymph stasis, blood stasis, cases in which the contractility and elasticity of the muscle have been lost or cases in which muscle tone is lacking. If we do not appreciate the pathology that we are trying to relieve, we can never accomplish a desired effect by empirical measures.

The delayed union, fibrous union or non-union seen in fracture work rarely offer opportunities for improvement by physical therapy alone. The delayed union in fractures is frequently the result of some local or general metabolic change while the fibrous unions and non-unions are unfortunately too often the result of interposition of soft parts. Physical therapy such as heat, in one form or another, diathermy or ultra-violet light may be of assistance in those cases of delayed union where local or general metabolic improvement is looked for, but I am not of the opinion that it is ever of much use in fibrous union or non-union. One might reason that the fibrous union is union without calcification and that certain forms of physical therapy might be of help in the laying down of calcium in the organizing tissue, but as a matter of clinical experience, I have rarely seen it. Moorhead*** states that fractures which fail to show union in a period 50% longer than the time usually taken for fractures of the same kind will probably fail to unite and that means should be taken to investigate the cause of why union is failing. Physical therapy cannot and should not attempt long periods of treatment for cases of non-union, inasmuch as the majority of these cases are due to mechanical interposition of tissue.

I believe that there is a very fertile field for the use of physical therapy prior to bone grafting, particularly in those cases where previous infection has been present. Surgeons vary very much in their opinions as to the length of time after infection that a bone graft might be performed safely. What the surgeon wishes to know is whether or not latent infection might be lighted up by the trauma of operation and, if this can be determined prior to operation, it would be of the utmost importance in preventing the catastrophe of prolonged drainage following bone grafting. Prior to a bone graft, in cases previously infected, we can obtain information as to whether or not latent infection is present if we will take a blood count so that we will have a basic normal, then treat the patient physiotherapeutically with heat, diathermy and active massage and, in the course of a few hours, again take a blood count. If retained infection is present, there will be a definite rise in the white cell count, a response to the local aggravation of the local condition, and there will

frequently also be seen a rise in temperature. If this is present bone grafting should not be attempted until, following this line of procedure, no aggravation is shown by this method.

It seems to be a common belief that the use of penetrating heat will stimulate osteogenesis and that the use of diathermy following bone grafting hastens union. I am not of this opinion. I believe that the judicious use of diathermy following bone grafting is useful in hastening the processes which will ensue whether the diathermy is given or not. I have seen bone grafts several weeks post-operative showing little or no osteogenesis take on a healthy and speedy growth after a few diathermy treatments and I have also seen the complete absorption of a bone graft under the use of diathermy. In other words, penetrating heat will hasten the process which is taking place whether it be in the formation of more callous or the tendency to non-union but it will do no more than hasten this process. It will not grow bone. The local and general factors present in the individual case are the determining factors as to osteogenesis.

Dislocations form another large group of cases, the result of trauma. When a dislocation occurs there must perforce be a rupture of the capsule of a joint. This rupture usually occurs at the weakest part of the point and, if we were to examine that joint by dissection, we would find that it appeared as a rent in the capsule and the ligaments surrounding the joint. The rest of the capsule and the ligaments are intact. It is only certain motions which will eventuate in redislocation of that joint.

Perhaps the commonest joint dislocated is the shoulder. At the shoulder anterior dislocation is the commonest type. The only motion that will result in re-dislocation is abduction and extension. If these be prevented there is no possibility of the joint re-dislocating. If, following a dislocation of this type, a simple sling be worn for a few days and the patient advised not to make attempts at the motions which might cause re-dislocation, there is no excuse for failing to give the patient the opportunity of other motions and of the physical therapy which will promote the rapid absorption of extravasated blood and hasten the repair in the soft tissue surrounding the joint. The uncomplicated dislocation of any joint which has been reduced should start physical therapy on the day of the accident. If this is done much time will be saved in the restoration of function.

Infection and the result of infection constitute a third large group which may or may not respond to physiotherapeutic measures. There is a vast difference pathologically from that group where extravasation of blood following trauma has resulted in hematomas, blood stasis and lymph stasis. At the time of infection nature attempts to wall off the area with blood cells resulting in induration of the tissue. Heat, hot wet dressings

and, in selected cases, baths are definitely indicated. Massage in the presence of infection is definitely contraindicated as it can do nothing but harm.

Infections of the hand particularly, whether they be paronychia, tendon sheath or fascial space infections, after adequate drainage has been established and pain has entirely subsided, will then respond to the whirlpool bath and be thereby definitely benefited. However, I would warn you against the use of even baths during the stages of temperature and while pain is still present. These are most frequently the indicators of the retention of pus under pressure which has not as yet been released and extension of the process may result from the too active use of physical measures. Drainage must be complete before physical measures can accomplish their purpose adequately. I would particularly warn you against the use of physical measures in a certain type of hand infection. These are known as tooth infections and occur usually over the dorsal surface of the metacarpophalangeal joints when an individual strikes the tooth of another individual, thereby sustaining a laceration in this region. The dangers occur in the type of infection which ensues. It is usually the spirillum of Vincent. The wounds are usually small but the type of infection will be spread rapidly unless adequate drainage be established and the wound antiseptized early by appropriate means. Physical therapy and inadequate surgery usually will spread this type of infection.

Physical therapy has a definite usefulness in the case of sepsis following trauma other than its local effect. General ultra-violet light and radiant light are supportive measures which frequently are successful in improving the patient's general condition and comfort and thereby promoting the healing process.
